1237 on the investments in its public utility securities
varied from year to year. I judge that it was between 4% and 5% the last year I was there. I can not be specific. The return in any one particular year may be influenced by write-offs or write-downs of securities during that particular year; so I think it would have to be explained that the actual return in any one year is not completely indicative of the investment results obtained during that year. If securities in the opinion of the financial committee, the executive committee and the management, were of such a character that due to conditions it was felt that it would be more conservative to write down their value on the books, it was occasionally done. It

might not suffer a capital loss eventually. I know securities for example that were written down while I was with the Equitable that have continued throughout the period to pay their regular interest.

We bought and sold many millions of dollars worth of bonds each year. We may have during the years I was there sold a few millions of bonds at a little less than they were on the books. There was only one public utility mortgage bond that actually defaulted in the interest. That was an obligation of the Seattle Gas Company. There were no debentures in the public utility field that defaulted in interest. There were defaults in bonds and debentures held in other fields, but they were not substantial. Of course there were a number of railroad defaults, as everybody knows, in that period to 1935 when I left the Equitable. We had a number of industrial debentures of which a few defaulted.

The utility investment porfolio included securities of the Associated Gas & Electric Company. Some of these investments were made before I got there and some were made afterwards as results of investigations and studies made by me. I joined in recommending their purchase. It has been a number of years since I looked at the figures, but I think that when I went with the Society they held $1,773,000 of those debentures and later acquired enough additional debentures to bring the total holding up to $5,000,000, that is the best of my recollection at this time. These debentures have never been in default.

The Society each year pays to its policy holders a dividend in varying amounts on different types of policies, retaining other earnings which go to Surplus. This is a policy holders' surplus. It is not the practice to pay out in dividends the entire return earned. It is difficult to say just whether such surplus of an insurance company is reinvested. It is different from an ordinary public utility or industrial corporation. The surplus which belonged to the policy holders mingled with the general funds of the Society and might be in cash or might be invested.

The rate of return is that per cent which applied to the fair value of the property will provide a sufficient amount to attract and induce investors to put up the necessary funds to purchase or construct the enterprise. It is not intended to provide a return of the money invested in the enterprise. I said it applies to the fair value of the property.

In making an investment, the investor feels that he will be able to convert that investment, or get his money back through holding it to the end. A rate of return must be applied to the fair value of the property. Investors realize that.

1238 I do not think a bond salesman who goes out to sell a $1,000 bond to an individual expressly tells the individual that the company is going to get a return on the fair value; but trained investors, professional investors, and institutional investors who study investments and set investment fashion know that. I don't know without making a test as to how many men of the first fifty I met in a walk down Wall Street would own securities in a public utility corporation and who would know that. When such an institution as the Equitable invests money or buys bonds of a public utility corporation, it expects the money represented by the bonds to be paid on the due date of the bonds, and it expects a return upon the principal amount represented by the bonds. The Equitable makes a dollar investment and expects dollars back.

I testified in the Brooklyn Union Gas Case as I have stated. I testified to a rate of return of not less than 7%. I think I said from 7 to 7½%, but not less than 7%. I think I said in my testimony that the capital structure of such a company as the Brooklyn Union Gas would appropriately be 50% or less in bonds and the remainder in stock.

My notion of a proper capital structure for a company such as defendants would be 50% or less in bonds and the remainder in common stock. The original capital liabilities of Natural Gas Pipeline Company of America were about $60,000,000 in bonds and $3,000,000 in stock. The unpaid bonds now amount to $44,000,000 and the remainder is represented by the common stock. Assuming that the total capital liabilities are $60,000,000, with no mention of reserve for depreciation or surplus, I should say that an appropriate capital structure would be approximately $30,000,000 in bonds and $30,000,000 of stock. I do not mean preferred stock. I do not agree with Mr. Emery's statement made yesterday than an appropriate capital structure of a company of this kind would be ½ bonds, ¼ preferred stock, and ¼ common stock.

By proper or appropriate capital structure, I mean the type of capital structure which is soundest and in the long run will provide capital at the lowest over-all cost. Assuming that the capital liabilities are $44,000,000 in bonds and $3,000,000 in stock, I would recommend the same division. I believe that the most appropriate capital structure for an enterprise of this kind is not more and preferably less than 50% in the form of senior bond securities and 50% or more in the form of common stock. Preferably I would say 40%—between 40% and 50% should be in bonds.

In my answer I meant to imply that the form of capital structure might affect the cost of capital to the company. I think that is a financial principle. If you try to finance a public utility with 90% bonds and 10% stock, I think you would find that the cost of the capital would be somewhat different than if you financed it say through 50% bonds and 50% stock. The cost would be somewhat higher if bonds represented 90% of the capital. Understand, I am speaking of financing through sales to the general public of these securities.

The management ordinarily determines what the capital structure of a corporation shall be in the case of a non-regulated corporation. In the case of a regulated corporation, the management and the local regulatory authorities have something to say about it. Perhaps I should also include the Securities and Exchange Commission and the Federal Power Commission.

I believe that cost of capital is one of the things that might well be taken into consideration in determining the rate of return. Certain courts have said that the 1239 cost of capital is one of the elements that might appropriately be considered in determining the proper rate of return. I mean by that the cost of capital to the given company that is under consideration in a rate proceeding as well as the cost of money generally. I think that in giving consideration to the cost of capital of the company under consideration where all of the capital is outstanding in the hands of the public and where arms length bargaining has existed with reference to the placing of that capital, it is appropriate to consider whether or not it is a balanced capital structure. I have never given any thought to that, and I should hate to give any horseback opinion about it. I think the cost under a balanced capital structure should both be given consideration; but I want to make it clear that in an enterprise of this kind where all the bonds are owned by the stockholders, it is obvious that the cost of capital does not mean anything. When I say this company, I mean the defendants.

I would not know without knowing all of the facts of the particular case whether the rate of return in the case of a company which has a higher cost of money because of the failure to have a balanced or sound capital structure should be higher than that of a company with a well balanced capital structure.

I have intended to advise the Federal Power Commission as to the proper factors they should consider in arriving at a fair rate of return for defendants. My testimony represents my considered judgment on the whole problem. Going back to the former question, I think that the company which has sustained a higher cost of capital because of the failure to have a balance or sound capital structure than another company which has a sound capital structure might well be allowed a higher rate of return. I agree with the principle that the cost of capital to a company should be given consideration in arriving at a fair rate of return.

It is impossible to find the cost of money to the defendants. That factor does not mean anything. In the ordinary case of a public utility whose securities are outstanding in the hands of the public, we can find out what debt money costs them through arms length dealing; and we can find out how the public is valuing the earnings of the company. Thus we can get a measure that way of the worth of the common capital, but in an enterprise of this kind where all the bonds are held by the stockholders of the company, it is impossible to do that. We can not make the calculation and we can not find out what the cost of money was.

They have bonds outstanding carrying 6% interest. I decided that because of the fact that the bonds were held by the company's own stockholders that it was necessary for me to ignore that factor in arriving at the rate of return for this company coupled with the fact that all of the common stock is held by certain companies, and it is impossible to get any quotation on the stock, makes it impossible to find out the cost of the equity money; and therefore you can not find the cost of the total money. You can assume 6% as the cost of the bond money, but that does not mean anything here, in my opinion. I did not assume anything as the proper cost of the bond money of these defendants. I have not made calculations as to the cost of money to this company because I can not make them.

Oh, yes, I made computations in my own mind and on paper as to how this company might be financed and considered that in arriving at my conclusion as to what was a fair rate of return. I gave that factor substantial consideration. I think this element would be included in one of the items which I outlined as the things I gave consideration to in my direct testimony. The things that I gave consideration to are scattered through the record here from the time I started to testify until I finished. It is possibly included on page 5503 in line 19. I think it would be reasonable for the Federal Power Commis-
1240 sion to draw the inference from that statement that I gave consideration to what would be a proper cost of money to this company. I think I put my calculations on paper. I have certain working papers here but I do not know whether the calculations are in there. I have as a matter of fact among my working papers a calculation which I made along that line. I have substantially everything that I used, except a lot of heavy prospectuses and things like that which I left in New York and which were difficult to carry.

In my calculation I assumed a capital structure, divided 50% bonds and 50% stock, and I assumed that the bond money could be raised at 4 to 4½%.

Referring to the statement you just read from the testimony of Dr. Dorau, at pages 5552 and 5553, to the effect that in his opinion it does not make any difference as to the rate of return to which an enterprise is entitled whether its securities be in the form of bonds, preferred stocks or common stocks or ordinary interest-bearing indebtedness like that to banks, I agree with that statement from an economic point of view. From a practical point of view, it is difficult to convince people that that is correct. I think from an economic point of view it is correct. In setting up my theoretical capital structure there, I did it in a way which I thought would provide the lowest over-all cost of capital and from that I made some checks and calculations to guide me in forming my opinion as to a proper rate of return for this company.

I think it would be appropriate for a regulatory body in determining rate of return to give consideration to the type of capital structure of a company and whether that influenced the cost of money. I think I ought to make myself clear by saying that it is appropriate for commissions to give consideration to it because the courts have said they must, and therefore they should. From an economic point of view, I agree with Dr. Dorau's statement that it really should not make any difference whether a company is capitalized with 50% bonds and 50% stock or with 100% stock from the standpoint of justice and equity.

I do not think there is an economic definition of "rate of return" that varies from my own in terminology. I do not state that cost of capital is not a proper element to consider in arriving at rate of return.

I have stated that I agree with Dr. Dorau's testimony. I am not an economic analyst. I do not hold myself out to be such. I am an engineer primarily. I can not translate myself to that position. I have to remain in my own suit of clothes. Yes, I think the courts have said that it is appropriate in arriving at rate of return to consider the cost of money as reflected by the form of capital structure. We have to agree with the courts. I think I can agree with the courts in the principles involved in rate cases and also with Dr. Dorau.

I am not considering something which I feel as a practical matter is not a proper element to give consideration to in arriving at a rate of return, nor have I merely considered that because I felt that under the decisions I was bound to give some consideration to it. I am not fully in accord with the idea of arriving at a definite rate of return because of the capital structure. I do not know of any other factors referred to in my testimony and considered in arriving at my judgment as to a proper rate of return in which I have no confidence and which I considered because I thought I was required to consider them under the
1241 decisions.

I do not remember having been advised by counsel for the company as to what the law was on the question of rate of return. I have had conferences with counsel, but there was no discussion as to what the law was on the question of the rate of return.

My testimony dealt with the presentation of an exhibit showing the earnings of utility and industrial corporations, and then I discussed following that a number of factors which affected the risk of the natural gas industry and this company. All investments have risks in greater or less degree. The investor is uncertain of the future, and where he sees possible dangers to an enterprise, he will demand adequate compensation before he will put his money into such an enterprise. He is primarily worried about whether he is going to get his annual return for the use of the capital and whether he is going to get his capital back when he wants it. Both of these elements are of great importance. I do not know whether it is possible to say which is greater without taking actual examples and working them out.

Obviously, if he were investing a million dollars in the bonds of a company which were going to mature 10 years from now, and the bonds were going to carry 4% interest, the total amount of interest involved is only $400,000, whereas the principal at stake is $1,000,000. The principal thing in which I would be interested in that case would be the return of the principal because it is the greater amount. The investor is also afraid that he may not get the 4% throughout the entire 10 years.

I referred, among other factors of risk, to the element of taxes. (Objection by Company Counsel overruled.) I consider that to be a serious risk for the utility industry today. I compared the risk of the natural gas industry with the risk of the electric and manufactured gas industry. I said, generally speaking, that this company has greater risks than the electric companies or other gas companies with distribution facilities. Probably this company is in better position than some electric companies, I think I made that clear in my direct testimony, that I was speaking from a general point of view. I think I very distinctly remember saying in my testimony that, of course, there may be gas pipeline companies, pure pipeline companies, that are better risks than some electric companies. I think, to make it clear, I said you might compare this company with an electric company in receivership. From such a comparison, this company is in a safer situation. That is not the only electric company that I could possibly consider to be in less favorable position than these defendants. I think these companies are in a better and stronger financial position and are perhaps less risky than some of the electric companies in the United States. I should hate to single a company out offhand without making a study.

Among the favorable things about these companies that are obvious to anybody making a study of these companies are their recent financial history, their earnings record in the past few years, particularly the last three years or so, the ability of the companies to reduce their debt, the ability of the management of the companies to build up gas sales and load the line, the fact that the companies serve a large market and connect to the large Texas Panhandle field—these are all factors. Generally speaking, I do not think they are in a more advantageous position than electric companies. I said, generally speaking, I think electric companies are a better risk.

I think I have enumerated the important favorable
1242 facts which would be interesting to an investor in a company such as these defendants. These companies were not particularly set up for comparison alongside electric companies. It is extremely difficult, if not impossible, to do that in the way you ask it; but I simply would list a number of the favorable factors which an investor would look at and would be interested in a situation of this kind. I would have to have for consideration a specific electric company. Certainly there are things about these companies that appeal to me, looking at it from an investor's point of view. I named a number of them.

They serve indirectly Chicago and surrounding areas. Commonwealth Edison Company and subsidiaries serve the same territory with electric energy. The Peoples Gas Light & Coke Company serves the city with gas. The Illinois Bell Telephone Company is the other large utility in the city of Chicago. I know the latter company but I do not know very much about it.

I am quite familiar with the Commonwealth Edison Company and in any study I would make of any situation involving Chicago, it would be in the back of my mind. The Commonwealth Edison Company, of course, is in a very highly favorable position when compared with these companies. There are no factors of importance in its operations in which it is at a disadvantage compared with defendants, although there may be some.

The Illinois Bell Telephone Company is in a highly advantageous position compared to the Natural Gas Pipeline Company of America.

I believe The Peoples Gas Light & Coke Company is in a more advantageous position from an investor's point of view than defendants. I cannot answer a question so indefinite as your inquiry, "Are there any aspects of their operations in which they are in a worse position" than defendants.

I have stated that I considered the effect of regulation as a risk of the company in arriving at my judgment as to the proper rate of return. I do not think I considered it a very serious factor. I thought it was a factor worthy of consideration. Regulation of natural gas pipeline companies is new and unknown and investors are traditionally scary of the uncertain.

I know that the Federal Communications Act was passed a few years ago. I do not understand that the Act gives the Federal Communications Commission a new broad regulatory jurisdiction over the American Telephone and Telegraph Company. I understand it gives the Federal Communications Commission some jurisdiction over interstate telephone rates; but I did not know that it gave the Commission broad regulatory powers over that company. I do not know enough about that Act to make any comparison between its effect on the American Telephone and Telegraph Company as compared with the powers of the Federal Power Commission over the natural gas industry.

I do not know whether or not that Act increased the cost of money to American Telephone and Telegraph Company. I have studied the Federal Communications rate of return study. I know of no rate case under that Act as yet. As I said before, I do not know very much about the Act and I am not qualified to express an opinion as to whether or not it tended to increase the risk or the cost of money to the American Telephone and Telegraph Company.

1243 I know that the American Telephone and Telegraph Company and its associated companies have issued many, many millions of dollars of securities in the last few years at very low interest rates. Of course, the issuance of securities by the associated companies has nothing whatever to do with the Federal Communications Act because they are under State regulation and not under regulation of the federal authorities. The parent company has issued many millions of dollars of securities. I have not given any study to ~~the~~ question of whether or not that Company has been injured by the Federal Communications Act; so I do not feel that I should express any opinion.

I made, in the preparation of this case, what I considered appropriate and sufficient study, but I made no study to determinate the effect of regulatory laws upon the cost of money to utilities.

I do not consider the natural gas industry in a more favorable position than electric companies and the electric industry with respect to the item of taxes. I never attempted to make any comparison or to set my study up that way; but if I did express an opinion, it would be that the companies which are extracting a natural resource from the ground and selling it would probably be in a more unfavorable position from a tax point of view in the future than established electric companies. It is taxation with reference to the future that I referred to. I would give the present or past tax situation the weight which I thought it should be given.

I have watched the taxes upon the natural gas industry; and I have also watched for a number of years attempts by legislators in various states to put taxes on the natural gas industry. Taxes on all the utility companies have shown an upward trend during the past few years. I would say that the burden on the natural gas industry is not substantially different from that on the manufactured gas industry. That is the way I looked at it when I made my study of the rate of return for defendant companies, to which I have testified. I would say it is not greatly different today; but I was trying to look to the future; and in looking to the future, I have a very distinct opinion of the possibility of future taxation on natural gas, and I think it is a hazard which is important.

As I have stated, I do not think the tax burden upon the natural gas industry is greatly different from that upon the electric industry, the telephone industry, and the other utilities. I have not made a calculation other than federal income taxes. They are taxes and, of course, I always include them as taxes.

The total taxes, exclusive of federal income and excess profits and undistributed profits, in the year 1938 for Natural Gas Pipeline Company of America were $325,000. The Texoma taxes were $168,000. The total taxes of both companies were approximately half a million dollars. The total revenues of the companies were around $14,000,000. The taxes were approximately 3% of the total revenues exclusive of Federal income taxes.

I am familiar with Poor's Public Utility Manual. It is recognized as an authoritative statistical source for data concerning the operation of public utilities. Beginning on page 1266, there is a report on the Commonwealth Edison Company. (Objection by Company Counsel overruled.) On page 1276 is shown the consolidated income account for the years ending December 31st of that company. Total operating revenue of that company for 1938 was $139,000,000. The taxes, other than federal income taxes, for the same year amounted to $19,115,442. That is about 14% of the total revenue.

1244 **J. A. EMERY**, a witness for the defendants, recalled for cross-examination, testified as follows:

(October 25, 1939)

Cross-Examination by Mr. Slaff.

I have gone over my Exhibit 148 between the time I testified on direct examination and the time I appeared for cross-examination. I have gone over Exhibit 149 which is the comparison of earnings according to my methods of comparison.

I have found no errors in Exhibit 148. With regard to that exhibit, I testified that it covered all the natural gas companies for which I could get prices on all the securities. I have since found that the Pacific Lighting Company, which is in the neighborhood of Los Angeles, disposed of its electric properties in 1938, so that its business now consists of gas transmission and distribution properties. The average rate of return on that property, computed in the same manner as on the other properties in Exhibit 148, amounted to 7.16%.

With regard to Exhibit 149, I have had a check of the figures made and I have also had made a computation of the cost at the time of construction of those elements of the construction that would vary from the present line if conventional practices had been followed. This is not a correction, but I carried the exhibit further than I originally had it to answer the question which the Examiner propounded to me at the time.

Now, I find an error in the estimate of the operating expenses in the particular of the operating expenses of the Fritch station, so that the total estimated operating expenses becomes instead of $3,501,974, $3,427,597. The net effect of that is to increase the earnings shown on the line at lower pressure, both by that particular and by reducing taxes.

The total increase in earnings of the line operated at lower pressure shown in my Exhibit 149, after taxes, is $61,600, bringing the total earnings of the line operated with lower pressure, according to my exhibit, up to $9,172,828. This reduces the earnings due to higher stresses. I knew about these errors before I got on the stand on Monday. I did not call them to the attention of the Examiner then or to the attention of counsel because I fully expected them to be presented either in redirect testimony or to come out in this testimony.

I did not feel any obligation upon myself to call to the attention of this Commission the fact that there were errors in my exhibits which I knew about at that time or at this time. (References to the testimony of the witness in a proceeding before the New Jersey Commission wherein the witness admitted the errors of 1¼ million dollars in his exhibit which were not called to the attention of the New Jersey Commission until brought out on cross-examination were stated by the witness to be correct).

Every now and then I see the publication of the New York Press Company, called "The Index." I did not see the autumn issue containing an article on the gas industry.

I remember the testimony which you now read from pages 5303 and 5304 of the record in which I stated that it was my view that investors in natural gas securities have taken cognizance of the special risks which I have discussed here as applying to natural gas pipelines in general, and that is reflected in the market prices for natural gas securities.

I think I must have discussed with some of the investors in this company the cognizance that they took of the so-called special hazards confronting this company, but I do not recall it specifically. I had some conversation with 1245 Mr. Gallagher one day about the whole subject; and that may have been brought up. I do not remember that it was. Mr. Gallagher is a high official of the Standard Oil Company of New Jersey, in general charge of their natural gas properties. I am referring to Ralph W. Gallagher.

The conversation I mention took place in the summer of 1934. That is the last time and the only time I can recollect that I have discussed with any of the investors in this company or those responsible for the investment in this company the cognizance, if any, that they took of the so-called special hazards, if we except Mr. Floyd C. Brown as a representative of one of the investors. I do not understand that Mr. Brown was in any way responsible for making the decision to put the money of Cities Service into this investment. Of course he was responsible for presenting the facts of the situation. On the basis of the facts which he presented which had been worked up by him and the staff working under his direction, a decision was reached by the Cities Service organization as to the making of this investment.

I have no knowledge at this time of the cognizance of any of the so-called special hazards confronting this company taken by any of the investors in this company, unless it was the general conversation that I heard about this line at the time of projection.

Our office was trying to obtain a position in the matter; and there was a great deal of talk made from time to time about it in the office.

In the preparation for my testimony in this case, I did not discuss with any representative of the Standard Oil Company of New Jersey responsible for Standard's investment in this company, what cognizance they had taken of the so-called special risks of this company. I talked to Mr. Lerch of that company but not on this subject.

Exhibit 148, which I presented here contained a list of eleven companies. If I were going to prepare a statement now under the same specifications, there would be twelve companies as I have already stated. I do not consider this a narrow list of companies. This is data that was prepared in 1938. It did eliminate the public appraisal of the securities of one type and another of various other natural gas companies. I do not know how many other natural gas companies have securities in the hands of the public. I would say though that it probably would not be much more than this number, of any size. I did not make a study to find out the facts on that point.

I made a study in preparation for my 1938 testimony in an attempt to bring down to date my Exhibit 49 in the Chicago District case. I think in that study, I procured a list of all the natural gas bonds that were outstanding in the hands of the public. This data contained a list of companies engaged in either production or transmission, or both, and there were 19 companies with 30 bond issues. There were 9 companies engaged in transmission and distribution, but I do not have the number of issues involved. I mean I do not have the information available here and I do not remember any effort to determine it.

As I testified before, I endeavored to determine the rate of return that is proper for this company by one of the methods used in 1934. That was the first method, where I determined the average yield on natural gas bonds and applied to that ratios of yield on preferred stock and common stock as determined from public utility com-
1246 panies, and ratios of bonds, preferred stocks, and
common stocks in volumes to the total investment in certain representative public utility companies.

We did not exactly bring the 1934 study down to date in order to prepare this Exhibit 148. We made a study, though, based on that method. By consulting it, I can tell you specifically if it was brought down to date. I started a new study in 1938, and it was not a matter of bringing down to date Exhibit 49 in the Chicago case. We simply employed one of the methods employed in the study of 1934.

I would like to say by way of explanation that the study in question was not brought to a conclusion and not checked in 1938—I mean the computation following as nearly as we could the lines of the 1934 study. The method I used in 1938 is similar to the method embodied in Exhibit 49 in the Chicago District case in 1934.

Going back to Exhibit 148, I did not use the Pennsylvania Gas Company figures for any purpose except as they were included in the figures for National Fuel, of which the Pennsylvania Gas Company is a subsidiary.

Of the ten other companies there shown, none, except the Lone Star Gas Company, has a capital as large as that of this company. Seven of those companies have less than 50% as high a capital. Of these 7, 2 have only about 20% as much capital as defendants. One of these two has a capital of about 10% and the other a capital of about 5% of the capital of defendants.

I do not think it makes a great deal of difference that the capital of the companies contained in this list may be only 5% of that of defendants. Size is of importance in these particulars,—first, there is a difference between a company not large enough to command good talent and a company which is large enough to do so; secondly, when the company's securities are distributed, a larger company is naturally better known, and, other things being equal, has a better market or broader market.

I do not think the same answer would apply to a comparison between this company and a company with any lesser amount of capital than defendants. I think when a company has an investment in the millions it is in position to command good talent, other things being equal.

I think a risk in an investment depends on size only to the extent that I have testified. I think as long as the size of the companies that I have used runs into the millions is sufficient to command good management, size has little, if any, bearing on risk, except as size means more hazards. I should say that a company with 2 or 3 million dollars of capital is in position to command satisfactory talent. I think a company with 2 or 3 million dollars of capital can command the same degree, proportionate to the magnitude of the job, of executive ability and talent in its management that a company with $50,000,000 of capital can. The talent in an absolute sense may be of lesser quality, but it manifestly requires a man of less calibre to operate a small property than a large one, that is, a man of less calibre might be fully as efficient an operator of a small property.

I do not think that an investor, judging the management of two companies and coming to the conclusion that
1247 the management of the company with the smaller
capital has less talent, would consider that as an added risk in the smaller company, unless it were less in proportion to the job. I said that companies under a few million dollars of capitalization cannot command the executive and managerial talent that companies with 50 million dollars of capital can. I am not able to draw an exact line between the size of a company that can command good talent and one which could not command proportionately as good talent. In the case of a company of $2,000,000 capital with no outstanding problems, I think it could command as good talent proportionately as a company with $50,000,000. The same degree of management would apply in proportion to the size of the job, that is, the magnitude of the problems and the quantity of the problems.

Ordinarily, a company with $2,000,000 of capital could not command the same skill and managerial and executive ability as one of $50,000,000 of capital. The larger company can command men of higher calibre than the smaller company. In days past in some industries, there might have been an advantage from an investor's point of view in a larger company due to its ability to pursue research. Now, however, I think that the general research facilities are such that a smaller company can avail itself of them. From that standpoint there would be no present advantage.

My answer, therefore, is that there is no advantage for the reasons I have just stated.

In preparing Exhibit 148, we used only those companies all of whose securities were dealt with in the year 1938. In most instances these dealings were with the public. Our criterion was that where there were records on market prices, we used the company in that exhibit.

On page 3 of the exhibit appears a note with respect to the El Paso Natural Gas Company, that is note B page 3 of Exhibit 148. The note might read "no market quotation; sold privately in 1938 at the price shown." That sale was made privately at the price shown. We tried to find all of the records we could of transactions in these stocks and bonds. We didn't get a market quotation for the El Paso Natural Gas Company for first mortgage bonds for the year 1938. That is a sale and not a market quotation. The same applies, as shown in Exhibit 148 at page 11, to the cumulative preferred stock of Kansas Pipeline and Gas Company except that the note might read: "Offered price as of March 1938, no sales price," instead of "no market quotation."

As explained, with respect to the common stock of that company, we did not get any market quotations. The price was obtained from a Securities and Exchange Commission document—I do not remember whether it was a registration statement or what. I think it was a registration statement. My instructions to my staff were to try to get a market quotation other than that statement from the Securities and Exchange Commission source and I was informed that they made that effort, and therefore had to fall back on this source.

With respect to the bank loans set out in that exhibit, there were of course no market transactions in the sense that that term is ordinarily used.

By the language you quote from page 5305, near the bottom, to the effect, that the fact that a transmission line owns a distributing company and is not one standing on its own bottom is a circumstance which enters into the risks involved in the securities or capital investment and that the ownership of a distribution system which buys from the pipeline insures to the pipeline the control of the market and adds to the total investment a proportion of lower risk property, I meant that all the investment in defendants except such as may be salvaged will be lost when the Texas Panhandle Field has been exhausted unless some new fields are discovered in sufficient proximity to the line. If such new field were discovered in sufficient proximity to the line, that would tend to reduce the hazard and the risk to the investor.

1248 In arriving at my conclusions as to rate of return, I assumed that there was a reasonable possibility that defendants' life would extend beyond the life of the Texas Panhandle field only insofar as I have compared this company with other natural gas production and transmission companies which have similar possibilities. There is the same possibility with respect to any of these companies listed in Exhibit 148.

By my last answer, I meant to imply that I did not give any particular consideration to the possibility that defendants as a going concern might continue operations beyond the date of the exhaustion of the reserves in the Panhandle. If I may summarize, I based my opinion on the actual effect of such a possibility on the securities of these 11 companies; and I did not make any increase based on that comparison for any additional hazard in the case of this company.

In other words, I did not assume that defendants had any less possibility of such a circumstance than those other companies listed in my exhibit. I do not think the consideration of the possible future life of this property entered into my judgment as to what was a fair rate of return except that I satisfied myself that these other companies generally have a longer expectancy than this company. I cannot give any more categorical answer to your question than that I just gave.

I read the testimony of Mr. Floyd C. Brown. I knew it was the opinion of Mr. Brown and some of the other witnesses that the field would be exhausted in 16 years, and I also knew that it was their opinion that they would go out of business when that field was exhausted. (Company counsel object to the question by Commission counsel; "Did you differ from that opinion or do you now differ from that opinion?" whereupon the witness conferred with his assistant, Mr. Timberlake. Commission counsel objected to the witness conferring with his assistant at a time when counsel for the company is making an objection to a question still unanswered. After colloquy of counsel the witness was permitted to state what Mr. Timberlake had told him as follows: "The Witness: He suggested to me that in the case of future field discoveries, there would be additional investment involved." Whereupon Commission counsel stated to the Examiner that in view of the statement the consultation was improper.)

In considering the rate of return, my conclusion was not affected at all by my opinion that the investment might have a certain safeguard due to the fact that the life of the company might extend beyond the date of exhaustion of the Panhandle reserves. It did go through my mind in considering the expectancy of this company with the expectancy of the other companies, but I considered it only to the extent that I have already stated.

I did not take into consideration the possibility that this company might continue in business beyond the time testified to by the company's witnesses, to wit, December 1954.

I have stated in my direct examination that I was testifying on the subject of rate of return on the assumption that from other evidence the Examiner and Commission would arrive at the probable life of the project. If the life of the project were estimated to extend substantially beyond the life of the Panhandle field on a sound basis with due regard, as Mr. Timberlake has just reminded me, to the investment required, and if such a total estimated life exceeded the general expectancy of these other companies, I would have taken it into consideration.

In my testimony, I accepted the expectancy of this company as testified to. Neither my staff nor I made any independent determination or attempted to make any independent determination as to whether the life of this company might extend beyond December, 1954. I think I have made no other studies in connection with my testimony before the Federal Power Commission except that reflected by Exhibit 148, going to the subject of the public appraisal of natural gas company securities. My recollection is quite clear that we did not make any trial studies of any nature involving any different method or any variation of the method shown in Exhibit 148.

We decided to go out and get the companies whose
1249 securities were in the hands of the public or were dealt with publicly, get the results as they might appear from the application of the method contained in Exhibit 148, and that was all we were going to do along that line. We were not making any other studies of public appraisal of securities of natural gas companies in connection with my testimony in this case. Now that I think of it, I think we did prepare some diagrams of comparative yields of

natural gas bonds and other bonds; but they were not embodied in our conclusions. These studies were somewhat similar to the graph contained in Mr. Delafield's Exhibit 147.

I do not consider that the method I employed in Exhibit 148 was taking two days' appraisal by the public. I consider that taking and covering a whole year. We took the highest price and the lowest price paid during the year. We have no data showing the number of days that the lowest price or highest price obtained during the year continued, but we have some information on monthly quotations. The average of the highest price and the lowest price does not represent the weighted average price of all sales for the year, but it represents the high price and the low price from which I have derived the average. The only complete weighting would be the multiplication and averaging of each sale by the price. Prices would naturally be affected by the market conditions and demand and supply.

The market price would take into account the faith that the public has in the management of the company. I have made no attempt to appraise the management of this company in comparison with the management of any other companies set out in my Exhibit 148, except in a general way, such as I could do by the examination of their reported results and discussion with Mr. Hill and Mr. Von Puhl of our office. This company is considered by me to have an excellent management. The other companies in this list have excellent management generally, but I have heard criticisms of some of them. In other words, the hazards of management are less as far as defendants are concerned than they are as to some of the other companies contained in Exhibit 148. On that basis, the wise investor would be willing to pay on a higher basis for the securities of defendants, which means that he would demand a lesser return than in the case of some of those companies.

If a company be over-capitalized with respect to its earnings, that circumstance would affect the public's appraisal of the value of its securities. The general aspects of capitalization would be taken into consideration by the public in appraising the comparative advantages or disadvantages of such companies as investments. If the company has no bonds and nothing but one issue of stock, there would be one condition; if a company has a very large issue of bonds comparatively, that would be another condition.

Before lunch, I agreed with you that the capitalization of a company would have an effect on the evaluation of its securities by the investor. I would say that a soundly capitalized company has less risk attached to an investment in it than an unsoundly capitalized company. There are degrees of soundness of capitalization. If two companies be soundly capitalized, but one is more soundly capitalized than the other, the one with the sounder capitalization presents less of a risk or hazard to the investor than the other, all other factors being equal. I think it follows then that the required rate of return for the company which is more soundly capitalized of the two would be less than the required rate of return for the other company. In a general way, I made a comparison as 1250 to the relative soundness of the capitalization of defendants as compared with the companies set out in Exhibit 148. It seems to me that in effect the capitalization of defendants comes nearer to that of the Interstate Natural Gas Company than any other because the bonds and stocks are owned by practically identical interests and are not distributed. I made this comparison as to the relative soundness of the capital structure of defendants and these other companies: I ascertained the capital structure of each of them; and as I say, I consider that of this company to be more like that of the Interstate Natural Gas Company than any of the others.

I compared the soundness of the capitalization of defendants with the soundness of the capitalization of the El Paso Natural Gas Company. I think the capitalization of the latter is sound. As to whether or not it is sounder than that of defendants, I find difficulty in answering the question in that capitalization of defendants is largely academic. It is practically all held by a few interests. It is not traded in on the market. There is no basis of comparison of the capital structure of the defendants and the companies set out in Exhibit 148 as to degree of soundness. If the capital structure of defendants is sound, I think risk due to the particular capital structure would not make a large difference in the rate of return. There might be some small difference depending upon the difference in volume, the relative volume of debt. If a company were unsound, an investor would require a higher rate of return to put his money into it than if it were sound. I am unable to go any further than that, as to what amount it should be, or what proportion.

I do not understand that rates of return are fixed by commissions with any regard to the capital structure. By that I mean that rate payers are not required to pay different rates because of over-capitalization or under-capitalization, from the standpoint of the securities issued. That was my judgment in determining the fair rate of return for defendants.

I think there might be a slight difference in the rates of return required as between two companies with different degrees of soundness of capitalization. If the differences in capitalization and the risks due thereto were large, the capitalization naturally would be unsound.

I am not able to answer your question as to whether or not there might well be a large difference in the rate of return, which would be required by the investor about to make an investment, based on the difference in the soundness of capitalization, because I do not think the difference in risks could be large as between sound companies. Contrasting a sound company with an unsound company, it would take a higher rate of return on what he pays for the securities to induce an investor to put his money in an unsound company. My estimate of fair rate of return is based primarily on the rate of return that has been demanded by these investors in these companies. In arriving at my final judgment figure of between 9 and 10 per cent, I came to that conclusion based primarily upon my judgment of the return that would be demanded by an investor in this enterprise. I might add to that the reward which I think the company is entitled to for its enterprise.

The general run of investors, I think, satisfy themselves that proper charges are being made for depreciation or amortization purposes. The primary interest of the investor, after that in the soundness of the company, is the earnings; and he will naturally see whether the earnings are stated to be adequate after adequate charges have been made. What actual earnings are depends upon whether 1251 a proper charge has been made for depreciation. In other words, I think if a company makes inadequate provision for depreciation, its earnings or its dividends represent in part capital rather than earnings. The earnings showing would naturally be based on the allowance made for depreciation. If the investor knew that proper allowances for depreciation had not been made, he would naturally pay less for the stock. The skilled investor would make an attempt to determine whether proper or improper provision had been made for depreciation. The making by the company involved of a proper or improper provision for depreciation probably would affect the market price of the security one way or the other, if there were any palpable overcharge or undercharge for depreciation. Whether or not proper provision has been made for depreciation would affect the attitude of the investor. If there were such a palpable over-charge or under-charge for depreciation, it would undoubtedly affect the market price of the security if it were known to the investor. I think it would be known to the skilled investor if there were a palpable overcharge or undercharge in the depreciation account. Such a palpable overcharge or undercharge in the depreciation account would affect the market price of the securities.

I ascertained the charges that were made by Interstate Natural Gas Company for depreciation and looked them over generally to form a general opinion regarding them. That applies also to each of the companies set out in Exhibit 148. I made no specific study of the properties and I arrived at no specific judgment on the proper amount of depreciation to be charged by each company in the year 1938.

If it be assumed that Interstate made an inadequate provision for depreciation to the extent of $1,000,000 last year, the actual earnings of Interstate would have been approximately ½ of what they are shown to be in Exhibit 148, and the return to the investor, under these circumstances, would then have been an average of approximately 5% instead of 10% if he had paid the same price for the stock. That same principle applies to all the companies shown in this exhibit

The price of a specific security might be affected at any given time by the desire or the necessity of a large holder of that security to sell that security rapidly. Such a situation would tend to depress the price of the stock or the security. I made no definite attempt to ascertain what factors, if any, affected the market at the time of the low price or the high price of each security set out in Exhibit 148.

I do not remember that this morning we discussed the possibility of a poor or inefficient management of a company as a hazard. I do not know how to answer that question. An investor contemplating an investment in a company considers the type of management that the company has. If he is considering two companies and he comes to the conclusion that Company A has a better management than Company B, all other factors being equal, there would be less risk in investment in Company A than in Company B.

1252 **W. C. GILMAN**, a witness for defendants, recalled for further cross-examination, testified:

Cross-Examination by Mr. Booth.

(October 25, 1939.)

I have made the calculations concerning Commonwealth Edison Company, Peoples Gas Light and Coke Company, Illinois Bell Telephone Company and American Telephone and Telegraph Company, which you requested at the time I left the stand before. I made them from the figures contained in Moody's Manual, which is considered an equal authority to Poor's. Moody's was the only manual that was available to me. I was able to find the total taxes and the total taxes excluding Federal income taxes.

For the Peoples Gas Light and Coke Company, the gross operating revenues in 1938 were $41,390,178. The total taxes were $4,679,619. The total taxes, excluding Federal income taxes, were $3,913,917, or 9.46 per cent of the total revenues. The gross operating revenues of the Illinois Bell Telephone Company for the same year were $87,186,670. The total taxes, excluding Federal income amounted to $10,283,114, or 11.79 per cent of the gross operating revenue. For the American Telephone and Telegraph Company and subsidiaries consolidated, the gross operating revenue was $1,052,657,832. The total taxes, excluding Federal income taxes, amounted to $111,067,572, or 10.55 per cent of the gross revenues. The figures I gave for Natural Gas Pipeline Company were for all taxes excluding Federal income taxes. These figures contain the social security taxes. From reference to Poor's Manual, I find that the amount stated for Illinois Bell Telephone Company did not include social security taxes. The amount of social security taxes for that company in 1938 was $1,516,991. The total taxes of that company, therefore, exclusive of Federal income taxes, amounted to about $11,800,000, or 13.5 per cent of the total revenues. The taxes of defendants, exclusive of Federal income taxes, I have stated amounted to about 3 per cent of the gross revenues for 1938. They were not greatly different in the years 1936 and 1937.

The Plant and Equipment Account of defendants shows approximately $59,000,000 as the total investment in tangible property. The total taxes paid by defendants in 1938 amounted to approximately .8 of 1 per cent of the amount reflected by the Plant and Equipment Account. The percentage for the years 1936 and 1937 would be approximately the same.

The tangible properties were carried in the Plant Account of Commonwealth Edison Company for 1938 at approximately $380,000,000, and the intangibles at $6,000,000. Excluding Federal income and Federal surtax on undistributed income, the taxes were $13,740,000, or 3.56 per cent of the total property including intangibles reflected by the Plant Account. If the intangibles be excluded, the per cent is 3.62.

From my general knowledge of these publications, they would be reported figures of the company to this statistical organization and would generally correspond to the figures contained in the company's annual reports to its different security holders.

According to Poor's Manual, the investment figure in tangible property for Peoples Gas Light and Coke Company for December 31, 1938, was $115,892,882, with an additional item of $6,195,864 carried as "office building
1253 and other non-utility plants". There is also another item for intangible property amounting to $23,609,442, making a total of $145,000,000. The percentage relationship between the taxes and that total is 2.7 per cent. Natural Gas Pipeline Company of America is apparently not referred to in Poor's Manual. That manual ordinarily includes only those companies whose stocks or securities are held by the general public. I am not sure of that last statement but I know that the statistics and financial statements of the company are included in other public utility manuals.

I made the statement you read from page 5488 of the record to the effect that during the last 10 years or so, the public utility companies as a class, electric and gas utilities, have certainly had to stand their share, or more than their own share, of the special taxation to meet budget deficits. I think that observation applies to natural gas companies, but I do not think it applies to quite the same extent that it does to certain electric and gas companies, particularly as we all know in the metropolitan areas where large special taxes have been put on to the local utility companies to finance unemployment relief. Such special taxes have been levied by the State of Illinois and in Chicago. These

Illinois and Chicago taxes do not apply to the Natural Gas Pipeline Company of America. I am not sure of this statement, but that is my impression. I did not know as to this when I prepared my testimony.

I have said that the statement you read to me does not apply to natural gas pipeline companies to the same degree that it does to the old established gas and electric utilities which operate in the large cities, and also in the smaller cities where the tax burdens have risen and utilities have been forced to assume their share. It does not apply to defendants to the same extent. The record shows that the tax burdens on defendant companies have been increasing, but I do not think they have been increasing to the same extent as say the taxes on the Consolidated Edison for the last ten years. I have not made a direct comparison, but Consolidated Edison is one of the outstanding utility companies in the country. In the past defendants have been in a more fortunate and advantageous position from the standpoint of taxes than have the electric and gas operating companies in the same area.

I did not say last night that the burden of taxes applied equally to both the electric and gas operating and the natural gas industry, as well as defendants. I think in your questioning about the tax burden, you asked me about the tax burden of Natural Gas Pipeline Company of America in comparison with electric and gas utilities and I said it was not greatly different. That is still my opinion.

There are many different ways of calculating taxes. You have asked me to calculate some taxes as a percent of gross operating revenue, of gross property account. Taxes might be calculated as a percent of net income just as properly. I don't think I ever made any calculations other than the mental calculations one would make by looking at the taxes and the income account and looking at those taxes in relation to the whole income account. I cannot remember ever having made any calculations of taxes in relation to the gross operating revenue or total plant and property account, or net income.

The basis of comparing taxes to gross revenues or investments is one way of determining whether or not the burden of taxes is equally heavy on defendants and other large utilities serving the same year. It is just one way of
1254 calculating or getting the relative magnitude of the
taxes when you are comparing a number of enter-

prises. What I am trying to say is, that there is not any one special scheme of doing it that has any particular validity over any other.

I do not agree with you that the risk to the investor, insofar as the element of taxes is concerned, is less in the case of these companies because they are in a more advantageous position than the large operating companies that serve the metropolitan area of Chicago. I would say exactly the reverse is true. These companies that are presently taxed heavily—the investor knows about what these taxes are today. The investor is not particularly disturbed by what he knows. The uncertainty is what worries the investor; and if those companies are starting out with a low tax now, they are perhaps all the more susceptible to taking on an additional burden of taxation. Defendants' past operations indicate that they have been in a distinctly advantageous position with respect to the payment of taxes as compared with the other utilities operating in Chicago and surrounding territory. These companies have paid very considerably less in taxes as a percent of the gross operating revenue or as a percent of the total Plant and Property Account than the utilities we have been discussing. I think you selected the three companies which are outstanding taxpayers. They are three of the large outstanding utilities which serve the same territory as defendants; but it is also true that there are many utility companies, I would say a substantial number of utility companies in the United States who, in 1938, paid less in taxes of the percent of the gross operating revenue than defendants.

I cannot pick companies that are operating in the same territory as defendants because you listed most of them; but among the companies operating in the territory through which defendants' pipeline runs, I know there are a number of companies which pay less proportionately than do defendants. The revenues of defendants are derived very largely from the Chicago metropolitan area.

As I remember it, I gave among the risks that investors would look at, the possibility of increased taxes. The fact that these companies' taxes are low now makes them more susceptible to increased taxes. I never have said the lower the taxes, the higher the risk, or because they had low taxes there was any special risk. I said that the possibility of increased taxes was a very definite risk, and the fact that the taxes were at a low level now made them particularly good prospects for the taxing authorities who were short of money. Yes, I think I will subscribe to the statement that the lower the taxes the higher the risk. And for that particular factor, the higher the taxes the lower the risk.

I don't know whether I can translate that observation you make that defendants should be allowed a higher rate of return than they would be three years from now, if in fact their taxes are increased. I intended my testimony to be applied specifically by the Federal Power Commission in determining the rate of return of defendants. I will say it this way, that of two companies, one of which was now paying 15 percent of gross operating revenues in taxes, and the other was paying .1 of 1 percent of the gross revenues in the form of taxes, the risk that would be facing an investor would be substantially greater in the case of the latter because of the possibility of a large increase in the taxation of that company. I would say that the Federal Power Commission has to, in determining the rate of return, provide what investors demand, otherwise the enterprise will decay.

1255 If the Federal Power Commission were confronted with two companies, one serving the City of Chicago, whose taxes we will say were 10 per cent of gross revenues, and another company serving the City of New York, whose taxes were 1 per cent of gross revenues, all other factors being equal, a higher rate of return should be allowed to the company serving the City of New York because of the greater risk of increased taxes.

I appraised the various risks referred to in my testimony to determine whether or not in fact they appear to be real substantial risks of these companies. I would not have mentioned any risk unless I thought it was real.

Yes, I understand there are taxes under consideration applicable to the Natural Gas Pipeline Company of America. I understand that the Texas Legislature is now being called into session to consider the possibility of putting a tax on natural gas produced in the State of Texas. Texoma has been operating in Texas about 8 years. They have had no substantial taxes of that character placed upon them as yet. Down to the present, no substantial taxes of that character have been placed on Natural Gas Pipeline Company.

I know that the operations of the latter are of interstate character but Texoma is a producing company. I will assume that the State of Illinois could not levy a tax upon the natural gas that defendants sell. I think I know generally as anybody would who has been in the investment field that the natural gas pipeline companies have for many years claimed that they were an interstate proposition and were not subject to local taxation or control. That does not tend to reduce the risk of taxes, as I understand it. These companies are taxed in the states through which they operate. The fact that defendants are engaged in interstate operations tends to reduce the likelihood of gross levy taxes or taxes of that kind; but I do not think it is fair to end it up that way, because this company is paying ad valorem taxes and other taxes in the states in which it operates. They are not paying as much as a comparable utility might, although as I have said there are some utilities who pay less.

I spoke about miner groups who are anxious to see natural gas taxed. These miner groups are not in Texas because there is not much coal mined in Texas. They are in Illinois. I am not sure but what political action in Illinois which might put a tax on natural gas at the point of sale would remove natural gas from the competitive fuel field. I have agreed with you that a gross receipts tax would not apply to defendants, but the gross receipts tax might apply to the Chicago District Pipeline Company. (Motion by Commission Counsel to strike latter portion of answer denied.) I know that the State of Illinois has a public utility tax of 3% or some such amount, an unemployment relief tax applicable to all utilities. I am not sure of the amount. I don't know whether Natural Gas Pipeline Company pays that tax or not.

I have a detailed breakdown of the taxes. There is no special listing for the State of Illinois unemployment tax, so I assume no such tax is paid. There is listed in Illinois only ad valorem tax. I made an investigation of taxes and tax burdens of these companies before testifying in this case. I don't carry all of those things in my mind. Assuming that the unemployment relief tax is 3 per cent of the gross revenues, the amount of that tax would be about $420,000 on 1938 revenues. I do not know that it is not paid by this company. I have here a very detailed breakdown
of taxes which I requested from the company, and
1256 I talked with the company officials about the taxes. I
made no independent investigation other than talking to company officials and requesting detailed breakdowns of taxes paid. I know that in the past years the burden of taxes upon defendants was substantially less than the bur-

dens upon other utilities operating in the same area. I did not refer to it in my testimony. I did not state specifically that one of the substantial risks of defendants was the factor of taxes, but did state that the possibility of increased taxes was a substantial factor. I certainly took into consideration the past taxes and operating expenses of the company; and I gave consideration also to the possibility of increased taxes.

(October 26, 1939.)

(Examiner strikes from the record all references to the impeaching testimony of Mr. Emery from a proceeding before the New Jersey Public Service Commission over objection by Commission counsel. The Examiner refuses Commission counsel opportunity to state his position as to the Examiner's ruling and the Examiner refuses to reconsider his ruling.)

I said certainly that the exhibit which I introduced, or certain parts of the exhibit to a greater or lesser degree, did influence me in forming my opinion as to a proper rate of return for defendants.

The language you have read from the record, beginning at the bottom of page 5461, is my testimony. In that testimony and from that point on to the conclusion of my direct testimony I dealt with the factors of risk as I considered them in arriving at my judgment on the rate of return for these companies.

I think I did attempt to outline the principal risks which I felt were inherent in the situation of defendants, and to which I have given consideration in forming an opinion as to the rate of return. Risks are unfavorable elements from an investor's point of view. I believe this business has some characteristics which are more favorable, from an investor's point of view, than the characteristics of some other businesses. I did not consider only the unfavorable characteristics.

Starting at page 5491, and probably before that—I just turned to that page here—the question presented to me with reference to which I stated the rate of return, was whether I took into account my knowledge of the facts concerning the nature and extent and the character of the investments of these pipelines. Certainly, in that consideration I took into account the pipeline itself, where it ran from, where it ran to, the fact that it sold its gas through contracts, the financial history of the company, and such matters as that.

The matters to which you refer namely, favorable characteristics stated by me in my testimony, are inherent in my testimony. I do not think I have in my direct testimony set out all the facts with respect to revenues and sales of this company. I said I took the company as I found it. I would have to read the record in order to be able to refer specifically to any statement, set forth in my direct testimony, referring to any of the favorable aspects of defendants.

Yes, I testified that, "The natural gas pipeline and production industry is a more risky industry from an investor's point of view than the electric industry." I also testified: "I must speak generally; there may be some small or medium sized or even large sized natural gas pipeline which is in a particular case better than some electric company which happens to be in receivership at the time. I am simply emphasizing that I am speaking generally, and I say that generally the electric industry is a much safer industry from an investor's point of view than the natural gas industry."

1257 I find it very difficult to select one natural gas pipeline company and select the characteristics of that company which are in as favorable a position as the electric industry covering a country like the United States. I suppose there are some things that are common to the electric industry and to companies such as natural gas pipeline companies. Speaking generally, the electric industry has some characteristics which make for investor safety. The facts, generally speaking, are that the electric companies control the distribution, control the sale of the product right down to the customer's meter. Generally speaking, I can not think of any risks of the electric industry which do not also affect the operations of defendants.

I assume I felt the same way at the time I testified on direct examination. I do not remember that particular question. Whether that ran through my mind, I am not sure. You asked me whether or not I know of any risks affecting the electric industry which do not affect these companies. That is a very difficult question to answer. The electric industry covers the whole United States. There are certain portions of the United States adjacent to areas where Federal projects have been built or perhaps are contemplated, where I would have to say, thinking the thing over, that those companies in that area probably did suffer risks, or have risks inherent that a company such as the

Natural Gas Pipeline Company does not have. There may be other local situations that I cannot think of at this moment with a question like this thrown at me.

Yes, I think it is true that the factor of municipal competition affects the electric industry generally and is a factor affecting the risk of the electric industry. I have just said that Federal competition is a risk; and municipal competition is in a similar position, in certain parts of the country. I would say that in other parts of the country municipal competition in the electric field is practically nonexistent. I have never heard of defendants having to face the threat of municipal competition. I have never heard that the companies which they serve directly or indirectly face the threat of municipal competition. The gas business is a business that municipalities, generally speaking, have not been particularly interested in going into. I would say that it is a fair statement that investors in purchasing the securities of defendants would not be concerned with the risk of municipal or any other form of governmental competition. I understood when you used the term "municipal," you were referring to cities and not to actions by either state or Federal agencies.

It is true that electric companies have substantial investments in poles and wires. The ordinary electric company which has distribution has a substantial portion of its investment in poles, wires and fixtures. That is true of transmission companies. The wholesale generating company would have less. It would have the major portion of its investment in its big plant or plants, and usually a much smaller proportion in its transmission lines and sub-stations.

The distributing company which purchases its electric energy would have a substantial investment in long distance high power transmission lines. As to whether these facilities are underground normally depends upon the locality and the particular practice of the company. In many cities practically everything is underground. In rural areas or in smaller cities a great deal of the transmission or
1258 distribution system is overhead, on poles. In the country through which defendants' lines are located, I would say electric companies would have a very large portion of their transmission and distribution system in overhead construction. Such property faces the possibility of damage or injury as the result of sleet or other storms in varying degree.

I don't think the same sort of storms give equal hazards. Defendants' pipeline has been damaged as a result of floods and rain storms. They have not been damaged by sleet storms, to my knowledge. Possibly the telephone line along the pipeline has been damaged by sleet storms, but I know of no damage to this pipeline by a sleet storm. The telephone investment of defendants is relatively small—somewhere between 1 and 2 per cent of the total investment. I agree that electric companies face the possibility of damage to a substantial part of their property as a result of sleet storms. In certain areas in the United States which are in the sleet belt, there have been from time to time storms that have caused damage to the wires of electric companies. Those conditions are not general throughout the United States. I think Illinois and the northern tier of states are more subject to sleet conditions than the southern states. I agree that these companies would not face the possibility of any damage to their property as the result of sleet storms and storms of that character, while an electric company or a telephone company operating in the same territory would face the possibility of damage to its overhead property; but I think it is important to keep in mind the magnitude of this possible damage. Largely all of this company's property is underground. As a general thing, this company does not suffer the same hazards of damage to overhead, over-surface property that electric utilities do, generally speaking throughout the United States.

I testified as appears on page 5465 that, "For a number of years, the gas industry has been suffering in competition and has lost substantial amounts of its domestic business." That statement was intended to apply, as the record says, generally speaking, but it also does apply to the local distributing companies directly or indirectly served by defendants, I think if the analysis is made, it will be shown that the distributing companies are losing domestic business, base load, all the time; but they have been at the same time taking on sufficient new business of a different category to perhaps make the overall showing not so bad.

The principal customer indirectly of defendants is the Peoples Gas Light and Coke Company. I have some statistics which show the number of customers at the end of 1934 to be 814,367. The corresponding figure for December 31, 1938 was 847,000. That is an increase of over 30,000 customers. The average number of customers of Public Service Company of Northern Illinois, in natural gas territory, for 1934 was 13,469. The customers are split into two categories—natural gas territory and mixed gas territory. The mixed gas is a mixture of artificial with natural gas that comes from the lines of defendants. Adding the two figures, I get the average number of gas customers of Public Service Company of Northern Illinois in 1934 to be 141,010. The figures I have with respect to these companies were requested by me from Natural Gas Pipeline Company, and I understand were obtained from the distributing companies or Chicago District Pipeline Company, I am not sure which. The corresponding figure for December 31, 1938 was 156,970, an increase of about 15,000 customers. However, I think it should be said that the revenues of that company have declined in the domestic field. The revenues from the total sales ~~of~~ gas in 1934 by Public Service Company of Northern Illinois amounted to $7,153,102. The corresponding figure for 1938 ~~is~~ $8,527,540, an increase of nearly 20 per cent.

1259 The Western United Gas and Electric Company is another company which uses the natural gas served by defendants. I have the corresponding figures for that company for the Northern Division. The Southern Division, of course, is not connected and is independent. The revenues for 1934 were $3,796,820 and the corresponding figure for 1938 was $4,208,573, an increase of about 10 per cent.

The figures I have read are the total revenues from the sale of gas for the companies mentioned.

The total revenue of Peoples Gas Light and Coke Company for 1934 was $32,696,883, and for 1938, $37,910,773, an increase of approximately $5,200,000, which is around 15 or 16 per cent.

I got the figures I have been reading about June of this year. It is my position that in the determination of the question of rate of return, the Commission should give consideration to the individual facts affecting the operations of defendants. When I stated that the gas industry had lost substantial amounts of its domestic business, I intended that statement to apply to this case. When we talked about domestic business, probably it is apparent that I was speaking generally, but I also say that the distributing companies which we have been discussing have, over a period of years, been losing domestic business—their domestic revenues have been going down. They have more domestic customers than they had 5 or 6 years ago, but revenue is what counts.

Their total revenues are higher than they were five or six years ago, but lower than ten years ago.

The house heating load is a part of the domestic load of a utility, but an insignificant proportion of the average company's load. (Motion to strike by Commission Counsel denied.) In 1938, the total revenue of the Peoples Gas Light and Coke Company from space heating, which includes not only central house heating installation, but also such items as radiant heaters and thinks like that, which are not really proper house heating installations, was $2,500,000, out of a total gross of approximately $38,000,000. The domestic is $22,000,000, of which approximately 11 or 12 per cent is from total space heating. I said an insignificant proportion of the domestic load of the general run of gas utility companies; and I also wish to state that I gave it here as the total space heating, which is the way that I have the figure broken down. This is not an ordinary concept of house heating. Approximately half the space heating customers really have house heating installations—actually 13,400 out of the 23,825 total space heating customers. Breaking the revenue down in the same way will result in the actual house heating revenue of $1,200,000 out of $2,200,000, or 5 per cent of the total domestic revenue. There is a reason why these two items should not be considered together, because really the service and revenues derived therefrom are different in character. One is, I think, more stable and more basic than the other. A person makes the installation of a central house heating job which requires an investment of several hundred dollars, and once it is in, assuming normal economic conditions, it will tend to stay in. The other space heating revenue is from radiant heaters, very small gas appliances. If they had a separate trend from the central system, the statistics might well be kept separately to manifest the trend. It happens that I have the figures only one way; and I wished to make it clear that the way I have them combines both types, because in ordinary nomenclature, house heating is referred to as a central gas fired boiler.

1260 In the reports of utilities such as the Peoples Gas Light and Coke Company no distinction is made between the profit earned from the sale of gas for domestic purposes and the sale of gas for other purposes. The total revenues are lumped together and expenses are deducted from them in arriving at the profits. A trained investor certainly knows the amount received from domestic purposes and the rate received, and the amount received from industrial customers and interruptible customers, and all such things.

Referring to my testimony at page 5469, in which I stated that in my judgment the distributing company which serves natural gas is in a weaker position as to risk than the company which serves manufactured gas, I would have to answer that question now the same way I answered it there. I think you have to look at it from two points of view. From a short-range point of view, a company distributing natural gas is in a better position to meet other competitive fuels than the company which is distributing artificial gas. However, from a long range point of view, with the uncertainties which exist with reference to the future supply of natural gas, it may be that the companies now supplying natural gas will in the future be forced to reconvert their systems back to artificial gas, at which time a great disturbance in business will take place.

I think the Peoples Gas in the light of all the facts I know about that company is in a better position today to meet competition of other fuels than it was prior to the introduction of natural gas. It can meet competition with other fuels by selling fuel in the form of gas at rates which make it advantageous for the consumer to use gas rather than other fuels, such as oil or solid fuel. That is possible because it has a cheaper kind of gas in natural gas as compared with artificial gas.

If the company reduced its rates it would be in better position as to competitive fuel. I think it is a maxim, that as you reduce the rates of your product, you are in a better position to meet competition. However, in making that statement it must be borne in mind that it is not always feasible to lower your rates to get business just for the sake of getting business. A company has certain financial requirements that must be maintained in order to keep it solvent. I think I could illustrate that statement in this way, that if Peoples Gas Light and Coke Company cut its rates in two, it would sell an awful lot more gas in Chicago; but it probably would be in the hands of the receivers within a year or so, or perhaps sooner. That is true because it probably would not earn enough to pay its bondholders. The margin between sales price and the cost of gas, including other operating expenses and taxes, would not be sufficient for it to meet its charges.

There is no direct relationship between fixed charges and rates. Rates, of course, are translated into revenues, and revenues must be sufficient to meet operating expenses, taxes, and fixed charges, or the company will get into trouble. When I said a moment ago that the feasibility of reducing rates was determined in part by the fixed charges of a company, I think I probably should have also said by its operating expenses and taxes and all such other items.

In determining the risk of defendants, consideration should be given to the companies served by these companies. I gave consideration to those companies. I remember distinctly without referring to the testimony that I referred to the contracts that existed. Obviously, one could not consider the contracts without taking into consideration the companies who were really the guarantors on the contracts. I don't think I stated specifically that the only thing I considered in connection with those contracts was the term and the price that was paid for natural gas under those
1261 contracts. I think I said that the principal things that I gave consideration to in those contracts were the terms and the price; but obviously, looking at the price and the terms of those contracts that I was perfectly familiar with, I took into consideration the companies who were buying the gas. (Motion to strike "obviously" by Commission Counsel denied.)

I testified, as shown from the record at page 5534, that I gave consideration to the terms of the contracts under which gas is sold, the length of the contracts, and the price at which it is sold. These, I think, are the principal factors.

I don't think that I specifically in response to Mr. Booth's questioning stated that I had given consideration to the guarantees by the three distributing companies. However, I think it is obvious that I must have because I stated very definitely that I had read the contracts and the amendments thereto. I did give consideration to the guaranties. I could not read the contracts without coming across the guaranty at the end of the contracts. That guaranty is an outstanding feature of the contract. I would not say that it is the principal feature. I believe the principal features of the contracts, as I originally stated, are the obligations to purchase a certain amount of gas extending over a certain period of years at a certain price. It is well known that the contracts were modified at a later date.

It would be perfectly proper for the Federal Power Commission in considering the risks of these companies to give consideration to the guaranty of the Peoples Gas

Light and Coke Company of those contracts. You are not correct in saying that I said I did not consider the guaranty was a factor of any significance affecting the risk of these companies. I testified to the facts you have read from page 5537 of the record. I knew of this guaranty at the time I so testified. I did not so state to the Examiner at that time. I did not and do not now consider it the most important feature of the contract. I think it was of importance and of substantial importance, but I have stated that I thought the two outstanding features of the contracts were the terms and the price.

I don't believe I am able to quote the assets of the Chicago District Pipeline Company. I have not got the figures here. I did not investigate the assets of that company. The Chicago District Pipeline Company is unimportant to me. The real strength of the guaranty comes from the companies who are actually selling and distributing gas—the Peoples Gas Light and Coke Company, the Western United, and the Public Service Company of Northern Illinois. I will accept your statement that the assets of Chicago District Pipeline Company are approximately 3½ million dollars. That company does not serve any domestic consumers, to my knowledge. It may serve some industrial consumers, I am not sure. I think it was originally organized as the Will Cook Construction Company back in 1930. It had no business of any kind prior to that date.

As to the contract entered into between Natural Gas Pipeline Company of America and the Chicago District Pipeline Company, the risk of the former would be substantially higher without the guaranty of the three distributing companies. I think the contract has added strength because of the guaranty by the three distributing companies.

1262 I am familiar with the arrangements under which Chicago District Pipeline Company sells natural gas to the distributing companies. It is obvious that the Natural Gas Pipeline Company enterprise would be riskier if there was no such arrangement or no contracts as guaranteed between that company and the distributing companies. As to whether or not I would recommend the purchase of securities of defendants in the absence of such a contract or arrangement, I should hate to give a horseback opinion. Generally, I would not recommend the purchase of securities without a careful study and a satisfaction to myself that the markets were permanent and real rather than transient. I say permanent and real, at least, semi-permanent. I think that informed investors would feel as I have stated. They probably would not purchase the securities under those circumstances.

I testified as shown in the record at page 5491 from which you have just read. I considered the facts set out in that part of my testimony which you read. In reaching my conclusion, I assumed that this was a pipeline, producing and transmission system with no control over their markets and with no distribution system, and I so stated at the time.

You asked me what investigation of the affairs and the history of defendants I made prior to the time I testified. I think the first thing I did was to study Volume 62 of the Federal Trade Commission investigation of the two companies. I think the next thing I did was to start to assemble in my office certain statistics of natural gas companies, and to get together figures as to investments available in other fields. That last would include study of prospectuses and recent financing of natural gas pipeline companies, utilities, and other companies. I then requested information of a statistical and financial nature from the company officials and received from them in due course a rather large amount of such information. I talked to Mr. Floyd C. Brown and I think he talked to me about the history of this company.

I distinctly remember everything that I did. I went to Chicago and met company officials including Mr. Brown, Judge Morgan, Mr. Hedrick, the treasurer and other people, and inspected the northern end of the line, and the measuring and reducing station at Joliet. I then went to Texas and visited the property of Texoma, conferred with Mr. Dickinson and other officials, and then drove through the acreage, inspected the wells, inspected the Fritch compressor station, went north along the line to Gray, Oklahoma, near where the southern connection of the Natural Gas Pipeline Company line ties on to the Texoma line, and visited the compressor station at that point. I then returned to New York and compiled statistics which I eventually used in the exhibit which I prepared. I think I had one further trip to Chicago to ask additional questions which were not clear to me and to confer with Judge Morgan with respect to the scope of the testimony. During the process, I should say that I requested and received maps and certain other data.

I had a general conversation with Mr. Brown. I cannot remember the details of it. I don't remember ever discussing the circumstance that defendants had no control over the market with Mr. Brown, and I don't think I would depend on him. I would form my own opinion as to that.

The opinion I have expressed here is my own; and I
1263 have so stated. I investigated the history of the project. I read portions of Mr. Brown's testimony. I am not sure I read it all. In answer to your question as to whether I knew when I testified that they were partners in this enterprise, I knew the facts with reference to the ownership of the Natural Gas Pipeline Company of America. (Objection by Company Counsel to use of word partners overruled.) The history of the development is clearly outlined in Volume 62 of the Federal Trade Commission investigation. I am not sure whether I stated or not that that was one of the factors that I considered in arriving at my judgment as to what this company's return would be. Page 1 of my information here shows the ownership of the stock back when the company was started and as it is now, and the ownership of the bonds. I did not put that page 1 into evidence on my direct testimony. I have stated that I assumed that there was no control over the markets by defendants in arriving at my judgment.

I certainly knew that the Natural Gas Investment Company had a substantial interest in the stock of this company and the bonds of this company. I don't remember reading the testimony of Mr. Brown at pages 1944 and 1945, in which he discussed the fact that the Chicago utility companies acquired from Gulf Production Company vast reserves of acreage in the Texas Panhandle, which defendants were anxious to obtain possession of, and that they were the logical marketers of natural gas in the Chicago area. In connection with that testimony he referred to the Chicago utility companies as a partner in the enterprise. I knew of my own knowledge about the investment of Natural Gas Investment Company in this enterprise, and I took that into consideration. It is correct that I testified that as one of the basic factors in arriving at my conclusion that this company was entitled to an 8 per cent return, was that they had no control over their markets. A number of pages in the record after I said that they had "no control of the market" in response to cross examination, I stated clearly my definition of "no control of the market," and that it meant no control of distribution facilities. (Objection by Company Counsel overruled.) I do not agree that it would be obvious that where there was a partnership relationship between the distributing companies and the pipeline company, that that thereby gave the pipeline company control of the market for the sale of the product. I cannot answer it because the question is complicated to me. I would have to know definitely what the partnership is.

I referred to price as an asset of the contract to which I attached some significance in measuring the risk of defendants. I had in mind other risks which to some extent are common as to other public utility companies. In a greater or less degree the risks of lighting costs with fixed contract prices and output as I stated on page 5487. That is what I had in mind when I referred to the price as influencing my judgment as to the risk of this company. I had in mind the particular scheme under which the defendants sell gas under their contracts. They have a demand charge plus a charge for the commodity with reference to the firm supply which is sold to Chicago District Pipeline Company. I referred to the contract price as a factor making for additional risk because of the difficulty of changing the price.

With this enterprise financed and engineered and built under the scheme whereby the revenues and the earnings of defendants were to be derived under contract form, any modifications of operating expenses upward would tend to be troublesome to defendants, because of the difficulty of increasing the contract price. It might be increased by negotiation, I suppose. It is true it has been decreased since the original contract was entered into. I was speaking then of the possibility of increased costs to defendants, with revenues more or less established by contract. Increased cost of operation as to labor and materials and of maintenance, and increased cost of gas in the field would lower the margin of profit.

The present price features of the contract under which defendants sell 120 million or something like that with a
demand rate of $5.25 plus the commodity charge is a
1264 factor which is of substantial importance to defend-
ants; and it tends to give them a stability that they would not have if they sold the gas on a day to day basis. I have known about that phase of the contract for years; long before I ever came into this case. At the Equitable, we were large holders of Peoples Gas Light and Coke Company bonds, and we were quite familiar with the con-

tract when it was originally entered into and when it was modified. The fact that they had a contract under which they sold a large amount of gas with the demand feature and the commodity charge certainly did enter into my judgment of this enterprise. I so indicated in my original testimony. I said I gave consideration to the contracts and the most important things in the contracts were the term and price. In my direct examination, I certainly said I took into consideration the contracts.

The annual amount of these demand charges is approximately 7 or 8 million dollars a year. I can not answer the question as to what other natural gas pipeline company has the same assurances of annual revenues, whether or not it sells one cubic foot of gas, or whether or not one cubic foot of gas is purchased by the distributing company. I don't know. I think you would have to break down that question on the point of magnitude of the enterprise. This company is a large enterprise and does receive, as you say, 6 or 7 or 8 million dollars a year demand charge from the buying company. In speaking earlier of the company selling 120 million that was 120 million cubic feet per day. The demand charge in 1938 paid by Chicago District Pipeline Company was $7,481,859. It also receives demand charges from other sales that it makes, but to a considerably smaller degree. The total demand charge in that year was $7,984,798.

I have a general familiarity with other pipeline companies and their methods of sale of gas. I don't think that I could repeat the details of them here. One other very large one is, of course, the contract under which the Detroit City Gas Company or now the Michigan Consolidated Gas Company buys gas from the extension of the Panhandle line. There is a demand feature in that, but I cannot state the amount in dollars.

(Company Counsel offers now the contracts on file with the Federal Power Commission of all the pipelines taking gas from the Panhandle field; namely, the Colorado Interstate, Cities Service, Panhandle Eastern, Northern Natural, Lone Star, and the Consolidated. Examiner stated that the contracts could be offered later.)

I know something about the price provisions of the contracts of other natural gas pipeline companies. I have read a great many of them, probably all of the important ones, from time to time. I don't remember the figures. I would have to refer to my files, but I could quickly find it. There is a demand feature in the contracts of Northern Natural Gas Company for sales of gas.

I did not specifically investigate the details of those contracts at the time I was determining the risk of defendants; but I had extended previous acquaintance and knowledge of the contracts of Northern Natural Gas Company, due to the fact that I participated as a representative of The Equitable in the purchase of $4,000,000 of bonds of the company in 1935. I am not sure of the exact time when Northern Natural Gas Company entered into contracts for the sale of natural gas to the companies operating in Minneapolis and St. Paul. It was within a year or so of 1935, and it is my belief that it does not sell gas in the City of St. Paul right now. It does sell natural gas to the Minneapolis Gas Company. I don't remember the term of that contract. I am not sure whether the contract had been entered into when the bonds were purchased by the Equitable.

1265 As to the total amount of fixed charges of this company, the bond interest of defendants would be approximately 6 per cent on $45,000,000, about $2,700,000, as of the present. My understanding is that the demand charges are payable simply for the right to take gas whether or not gas is delivered.

I think the Wisconsin Electric Power Company had a similar contract up to a short time ago. The company has recently been merged with the Milwaukee Company. That company has nothing to do with gas. He asked me to name, I thought, any other public utility company that had any such contract under which it would receive, regardless of output, sums in anywhere near the same relationship that defendants did, to its fixed charges, and I gave the first name that I could think of. Answering the question as to whether the contract is any longer in existence, I said the companies had been merged just recently. I should say that a somewhat similar contract would be that between the Mississippi River Power Company and the Union Electric Company of Missouri. I have not the amount of demand charges in my head. I have only a general idea as to the relationship.

I have testified here that a fair rate of return for defendants would be 8 percent. I have stated in the course of my testimony that I have been called upon to advise institutions and others with respect to the investment of funds.

If I were given $50,000,000 today and were asked to invest that money for the purpose of producing a return of 8 percent on that $50,000,000 for the next 15 years, I don't know offhand where I would invest it. I am familiar with the investment business, but one does not give a horseback answer to a question like that. I have some ideas where that money could be invested to produce a return of 8 percent. You ask if I know that they would produce a return of 8 per cent for the next 15 years and still be sure of the principal amount of money invested. I could not qualify for a prophet's role—such as you have outlined to me.

I think the Peoples Gas Light and Coke Company is in a better financial condition than the Brooklyn Union Gas Company. It is now serving a mixed gas in the territory it serves; and to that extent is, in my opinion, in a better position to meet competitive fuel conditions than is the Brooklyn Union Gas Company. The latter serves only artificial gas.

I made some investigation as to the needs of defendants for additions to their property during the next two years. As to the amount, it would just be a guess. I would just guess around a million or a million and a half a year.

I testified that the risk of a pipeline company such as defendants' was substantially greater than that of a gas distributing company. I think there are aspects of the operations of the gas distributing company which contain risks which are not inherent in the operation of a natural gas pipeline company such as defendants'. I should hate to enumerate all of them offhand, but one that comes to my mind immediately is in connection with a manufactured gas company serving an urban area with a large part of its expenses going to labor. It might have labor troubles; and the possibility of labor troubles, perhaps, is a greater hazard in a distribution company where the labor is a greater proportion of the gross than in a pipeline company where it is smaller. I would have to refer to my statistics to give you the proportion of the annual labor cost of this company to its gross revenues. It is substantially smaller than for a city distribution company. It is substantially smaller than the labor cost for an electric or telephone or a gas operating company.

Another risk which a pipeline company does not have in the same degree is the possibility of increased labor 1266 costs if wages go up. The pipelines would have this risk but it would be less proportionately. Inasmuch as the present labor costs of the distributing company are larger in proportion to gross revenues than those of the pipeline company, then with a substantial increase in labor costs, I think the effect would be more detrimental to the distributing company than to the pipeline company. I do not think that I have the proportions of annual labor cost to the gross revenues broken down in this tabulation here. In my breakdown of the operating expenses, labor is not segregated out from the primary accounts. I have some idea of the labor costs in this enterprise, but I would have to go through all of my data here to find out the exact figures. I have stated that defendants have fewer employees per dollar of gross than does a company such as the Peoples Gas Light and Coke Company or the Illinois Bell Telephone Company, or the Commonwealth Edison Company. The defendants have about 600 employees.

I made a careful study of the risks of defendants as compared with the risks of gas distributing companies. Of course, the contemplation of those risks and the weighing of those risks is something that takes place in the processes of the mind. I am not prepared to state at this time any other risks which are inherent in the general type of electric or gas utilities that are not inherent in the Natural Gas Pipeline Company. They are not the same kind of business, and many of the elements of each business are so different in character as to make any such comparison meaningless, in my opinion.

It is not difficult to make a comparison of the risk, Mr. Booth. Anytime that an informed investor buys securities, he knows what the risk is, or at least he has an opinion of the risk at the time that he makes the investment. Because of the difference in the characteristics of the companies, it is difficult to compare the risks of pipelines with those of utilities, but it is possible to do. I have said that I can not generalize in response to your question as to what are the other aspects of their operations in which the operating companies have risks which the pipeline company does not have.

I did not testify that the risks of manufactured gas distributing companies were higher than the risks of a natural gas pipeline company. I said that the risks of distributing companies were less than those of pipeline companies. It is my belief that the risks of a company such as the Natural Gas Pipeline Company are greater than the risks involved in companies which distribute gas, that is generally speaking.

I am able to discuss risks both in general and specifically with reference to companies which I have had occasion to look into in the recent past. (Objection by company counsel.) I can not tell you about the risks of gas operating companies which do not apply to pipeline companies, because the risks of the operating companies are, generally speaking, to some extent present in pipeline companies, but it is a question of degree. I have stated that the distributing companies have a greater risk of labor trouble and of increased labor costs than do pipeline companies. Without getting down to specific companies, I can not tell you whether or not that is the only item in which the gas distributing company has a greater risk than the risk of a pipeline company.

1267 *Questions by the Examiner.*

I have made some specific analysis of distributing companies by way of comparison. I recently appeared in rate cases involving two rather large gas distributing companies in the State of New York: The Rochester Gas and Electric Company and the Brooklyn Union Gas Company.

I think the risks in the distributing companies probably also appear in the business of defendants, but in different degree; and unless you are discussing two particular companies, I do not think that you can generalize about it. You might take the question of materials in a gas distributing company. There the cost of materials takes up a rather large proportion of the operating revenue or operating expenses. Depending upon whether or not the cost of coal goes up, and also depending upon the location of that utility and the transportation charge of the coal, will depend the results of that company. Now, similarly, if the cost of production of natural gas down in Texas goes up, the cost of operation of defendants will increase. On the question of sales, a company which is a distributing company and has control over its markets may, in view of peculiar local or other economic conditions, decide to make a sales campaign or do something to increase its sales of gas in a certain category. A pipeline company which has no control over its markets is not in such a position.

Cross-Examination by Mr. Booth Resumed.

Defendants are handicapped by the fact that they do not determine what shall be done about the sale of natural gas by the companies who sell their natural gas. They have some possibilities of control of the sales of boiler fuel and industrial gas, which is not a large proportion of the revenue; but in respect to the gas sold under firm contracts, they have no such control. I do not say that they are handicapped today. They may be. The result of my investigation showed that they might be. I do not think they have been handicapped in the past. I am not positive that they will be handicapped in the future.

The Peoples Gas Light and Coke Company spent money to promote the sale of natural gas in the City of Chicago. They spent a number of millions of dollars in connection with the change over, and I understand that they have spent additional money in an attempt to promote house heating and other large volume sales of gas. As a matter of fact, the Natural Gas Pipeline Company was in a distinctly advantageous position because it did not have to bear that expense. That is the usual practice. The distributing company usually pays the cost of the change over. It is customary for the company who is actually selling the gas at the point of sale to pay the cost of promoting that sale.

All of those things that I have named have not been factors indicating where the hazards of the gas distributing companies are greater than those of the pipeline companies. I have simply named some of the factors which are hazards of gas distributing companies and where their hazards might be greater or less. I can not think at this moment of any other hazards.

Assuming the accuracy of the testimony of defendants' experts as to the life of their reserves, and assuming also that on their calculations, the investors would have been returned the money that they invested in the property. The companies, at the time of the exhaustion of their supply, would probably be able to cease business. The Peoples Gas Light and Coke Company would probably have to get a

certificate of convenience and necessity in order to terminate their operations at that time. The Peoples Gas Light and Coke Company could not terminate its operations
merely because the supply of natural gas of this com-
1268 pany had been exhausted. As a practical matter, they
would have to try to find some substitute supply. They are now supplying a mixture of artificial and natural gas. They still carry and operate certain of their artificial gas manufacturing plants, and they undoubtedly would continue in the operation of the gas business in the City of Chicago.

I am not able to state what proportion of the investment which defendants made in their pipeline property has already been returned to the investors. Defendants originally started out with a thousand shares of stock. Soon after they got going, they had $61,000,000 of bonds and $3,000,000 of stock. I presume that was intended to represent the investment in that company. The capital structure today is about $44,400,000 in bonds, and $3,000,000 of common stock. The total bonds redeemed to date are $16,600,000. Out of the $64,000,000 representing the investment of bonds and capital stock, the bonds redeemed amount to approximately ¼ of the original capital structure. (Objection by Company counsel overruled.) Offhand, I cannot name a gas or electric distributing company which has retired in the last five years, 25 percent of its debt; but in evaluating the hazards, it is well known that investors because of the extra hazards of the natural gas pipeline companies, require the amortization of their debts over short periods of years, and do not in buying distributing companies' securities require any such sinking funds. That is well known.

The reason generally for the amortization provision is because of the difference in the fundamental character of their business; namely, that the natural gas supply and transmission business is primarily an extractive business which might be limited for a specific period, while the business of an operating and distributing company continues indefinitely. The reason for the investor's demands that pipeline company debt be amortized rather rapidly is because it is an extractive industry, and investors are uncertain of the future of that industry.

It is not my understanding that by debt reduction the capital is being retired. The changes in capitalization are proportionate. The debt is being retired, but at the same time the equity holder's stake in the future is greater. If the equity holder and the bond holder are the same, the total investment remains the same, only it is in different proportions. As the debt is retired, his investment in the bonds becomes smaller and his investment in the common stock becomes larger. The investment by the bond holder represents capital embarked upon the business. These companies are retiring their bonds from the earnings of the companies. By earnings I mean the difference between the operating revenues and expenses, and the bonds are retired from the cash which is in the till of the companies. I could not earmark a dollar like that and say cash exclusive of amortization charges.

I assumed that when you said "amortization", you meant depreciation. The bonds that have been retired by this company have been retired through using the cash available in the treasury of the company. That cash, of course, is derived from the earnings of the enterprise, and the total cash generated in any one year is dependent on the earnings, the amount of money going into construction and the amount of provision for depreciation.

1269 At page 5471 of the record I referred to the fact that the City of Chicago at one time had a supply of natural gas. It came from a very large field in the extent of acreage covering quite a sizeable portion of the State of Indiana. I cannot remember the total acreage of the fields. I have reports and studies of that enterprise in my files. I don't remember the amount of the gas reserves. The period during which natural gas was supplied to the City of Chicago was around the turn of the century. It may have been five years before and possibly a few years after. I don't remember the exact number of years natural gas was supplied. I did not intend to compare the size of the reserves of those fields with the Panhandle field. I simply mentioned that as indicative of what had gone on in the past and as something that investors remembered. I don't know whether the rates were increased in Chicago after the gas company returned to the supply of manufactured gas.

I spoke of the possible failure of supply as a factor in the risk of this company. I consider it an important factor. I cannot say how important, but I think it is of substantial importance. I certainly gave weight to it in arriving at my judgment as to what was a proper rate of return for this company and in forming a judgment on a matter of this kind, it is impossible to say exactly and precisely how much any one risk is involved or how much influence any one risk has in the formation of your final judgment. You ask if I would say it was a major factor. I hesitate to classify such intangibles in such definite categories. I would rather say that it was certainly one of the factors which I considered in evaluating this company and determining what I considered a fair and proper rate of return. In forming an opinion of this kind, it is impossible for me to classify and state the magnitude of all of the various factors of risk which I give consideration to.

It is a judgment matter and my position today is that it is not possible to state that it was one of the principal factors in arriving at my judgment as to what the risks of this company were. I think the best way to say it, and the way I like to say it is that it is a substantial factor to which I gave consideration. I can think of no other factor at this moment of any greater importance.

You asked what investigation I made of the reserves of this company. In the first place, I was, through previous experience in investing, to some extent familiar with the reserves of the Panhandle field. I have studied reports of prominent geologists going back at least 5 or 6 or more years which had been furnished to the Society in connection with the consideration of investments. The geologists' reports which I read included reports made for the United Gas, Public Service, Panhandle Eastern Pipeline Company, Lone Star Gas Corporation, and some others including the Northern Natural Gas Company. The firm who made the most reports that I can remember was Ralph Davis. You ask what he concludes about the life of the field. Those reports were made at varying times and for different companies whose supply was from the Panhandle and other fields. I have no recollection at this time of any specific figures in trillions of feet. I have a range in mind, but I don't remember the exact figures. In addition to that, I of course obtained data from the defendants and studied certain exhibits which have been prepared in this case, and talked to certain people in reference to their exhibits where estimates had been made on the life of the field. I talked to the people that were employed by the company, who had made the studies. I talked to people in my
1270 own organization generally on this matter. I did not make an independent inquiry among other geologists to determine the accuracy of the estimates made by de-

fendants. I did not retain Ralph Davis or anybody like that.

I know that Mr. Claude Brown has testified in this case. I understand he is an employee of the Federal Power Commission. I do not know to what he testified specifically. I believe I heard that he testified that the field had a long life, but I did not specifically get his figures in support of that. I have made the investigation that I considered necessary to form my opinion. It was not necessary in forming my opinion to get an absolute idea as to the length of life of the field. In forming my opinion, I assumed that the field will last at least 15 years. I am assuming that the life of the field will be 15 years, but of course there is the possibility that it will go out before then. I did not say that was the principal factor in evaluating the risk of this company. I said it was a substantial factor, that the hazard of the shortening of the life of the field was a substantial factor, and that I could not think at the moment of any other factor which was of greater importance.

You ask me the following question: "In arriving at your conclusion of 8 per cent, you gave consideration, of course, to the possibility, and as you say that was the most important factor you can think of, of failure of the supply between now and the end of 15 years." I have never said, of course, what is asked in the latter part of your question, and I do not wish to say it. I will repeat again my consideration of this factor. I said it was substantial. I have said that at this moment I cannot think of any factor of hazard which I consider of greater importance than the failure of the supply. The 8 percent does include the consideration of the risk due to the possibility that the supply may fail. In my mind there is a distinction between this phrase "factor of importance" and "principal".

At pages 5485-6 it appears I testified, "In any natural gas pipeline, a company which produces and/or purchases natural gas and transports it through a line for sale, such a company is subject, of course, I think, to the principal hazard of the possibility of failure or shortened life of the supply." I think my recent statements are more accurate.

There have been a number of failures on defendants' line. In my tabulation of failures, I find four failures, one in 1936, and three in 1938. In the first failure, on July 4, 1936, the estimated curtailment of sales was 24 million cubic feet. On February 13, 1938, the estimated curtailment of sales was 468 million cubic feet; August 14, 1938, 17 million cubic feet; and on August 20, 1938, 36 million cubic feet. That would be a very small percentage of the total sales of the company in the 8 years. It appears to be about .2 of 1 percent.

In my investigation of the estimates of the life of the reserves of the Panhandle field, I do not remember examining the estimates of Thompson and Hughes, who testified in this case. I examined Mr. Peterson's figures, and portions of Mr. Dickinson's testimony. The latter were employees of defendants. I saw other figures but I do not recognize the names of Thompson and Hughes. I did not investigate the estimates that they made of the life of the field in 1934. I do not know what life of the Panhandle field these geologists testified to in 1934. I made no effort to find out. Of course, I was not able to compare their estimates with the estimates that were made by defendants' experts in this case.

I don't remember examining the record at all in the Chicago District Pipeline Company versus Lindheimer case. I understand that by "the record" is means a transcript of the testimony, evidence, exhibits, or anything that was submitted in that case. I have collected in my office in recent years all of the information possible in the way of briefs, opinions and things like that on such matters
1271 of this kind. I may have, but I have no distinct recollection of that case. I did not know that there was a great deal of evidence and information there bearing upon the early history of this enterprise; I have no memory of what was in that case. I have stated a number of times that I made inquiry as to the early history of this enterprise. I did not talk to a man by the name of Gallagher. I have heard of him but I do not know him personally. I understand he is an official of the Standard Oil Company with particular responsibility for natural gas operations. I know that he was formerly a director of defendant Natural Gas Pipeline Company. I read very carefully the Federal Trade Commission record which is quite complete on the early history of this enterprise, and I am quite confident that Mr. Gallagher's name was mentioned in there. I made no effort to determine whether the company in its early history made any estimates, or the officials of the companies made any estimates of the profits that they expected to make during the life of this enterprise.

I testified as shown on page 5495 of the record that an investor would demand that the period of amortization under regulation be less than the life of the project as expected at the time he made his investment, in order to provide a factor of safety. If at a later date it is found that the project is going to last longer, the amortization could be changed at that time with no loss to anybody. It is not necessarily true that charges to amortization or depreciation determine the income of the company for rate making purposes. The amount of such charges is a factor that is taken into consideration. It would be a very important factor in this case. I have no particular knowledge at this moment of the amount of amortization, but it would be an important factor. I made no investigation of that.

The amount of amortization or depreciation charge is determined in this sort of enterprise by the estimated life of the field or the life of the reserves or the life of the project; I would think that would be the controlling factor. In my statement that "the amortization could be changed at that time with no loss to anybody," I meant that ordinary prudence would require that an amortization provision would not be set up on the exact life of the field. If a big institution is buying mortgage bonds of a natural gas utility company, and it has reports from the most eminent geologists that the life of the field is 20 years, no institution will buy 20-year bonds, but they will buy 15-year bonds.

I have said, I think, it would be a prudent thing to fix a shorter period than the indicated life as the period of amortization. I have not said that my rate of return depended on any regulatory commission doing that. I have said that my rate of return was 8 percent after proper provision had been made for amortization, whatever that was.

Assuming that the life of the field is taken at 10 years, which means an annual charge to amortization or depreciation for 10 years, and then at the end of 8 years it is discovered that the property in fact will have a life of 20 years, the rate payers will have suffered during that 8 years because they will be paying more charge for amortization than turned out to be necessary. I do not consider that that is inconsistent with the public interest, though. The rate payers from that time out could or might under regulation pay a very small amortization. It might be decided at that time by the regulatory commissions in that way.

Cross-Examination Interposed by Mr. Slaff.

1272 I was not speaking of the consumer at any given time in the statement I just gave. I think I was taking a long range view as opposed to the short range point of view, when I said that I did not think my statement there was inconsistent with the public interest. I do not think, generally speaking, that the present consumers should be burdened with bad practices or losses of the past. I do not think that future consumers should be so burdened; but I do think that regulation must adopt a broad viewpoint and consider the interests of both investors and consumers.

I agree with your statement that in considering the interests of consumers, we mean the public at large over a period of years, rather than the specific consumers at a specific time. I have heard of the case of Bronx Gas and Electric Company against Maltbie, decided on the New York temporary rate law in the New York Court of Appeals. I am not familiar with the language you quoted from that case. I think my views are expressed in the language of Judge Crane in that case, in which he said: "True it is that all the consumers paying the final rate, including the takeup, may not be the same as those who paid the temporary rate. A few consumers may be new customers paying what the old consumer should have paid. Such expenses are of minor importance. The percentage must be very small. We can never work our institutions of government if we refine matters to such an extent that we have to consider all these little details. The Constitution expresses fundamental principles, and if in the main these have been observed, this is all that can be required. Besides, when we speak of the consumer, the customer, we mean the public, not individuals."

Cross-Examination by Mr. Booth, Resumed.

You asked if under my theory it should turn out that the rates are high enough during the next two or three years so as to amortize all the investment during those first two or three years, then after that all the risk would have been eliminated at the end of that period, and from then on the rates could be based on no amortization and a riskless rate of return; my answer is I don't think it would be proper or economic or possible to do it that way. That was not what I was indicating in my testimony. I am trying to give the practical answer and I am being asked to answer a completely impractical and theoretical question.

Your question is based upon an absurd interpretation of what I said. I am simply saying that from a practical point of view, an investor would demand that the period of amortization be "less than." I did not say "one-fifth." I said "be less than." I am taking by analogy the insurance company buyer or the institutional buyer of securities. If he is convinced from geologists' reports that the pipeline has a life of 20 years, he may be willing to buy bonds at 15 years. He wants that safety factor.

I think that the bonds of natural gas pipeline companies of substantial size have been sold to institutions on a 15-year life basis where the reports of geologists available to them indicated that the life of the field was 20 years. I think that perhaps I should add to that and say that perhaps a more common statement by the geologists is that the field would last not less than, or the supply should last not less than, 20 years, in which case the institution would buy on a 15-year basis. That observation was implicit in my earlier statements concerning which I have been asked here on cross-examination.

1273 (October 27, 1939.)

A substantial part of defendants' revenue is from sales of an industrial character where the profit margin is probably less per thousand feet than it is for the sales under the firm contracts. It is not unusual for a gas or electric utility company to sell a substantial portion of its product for industrial purposes. I testified that about 25 per cent of the revenues of defendants was obtained from gas sold for industrial purposes.

I am generally familiar with the operations of the Commonwealth Edison Company but I would not attempt from memory to state the percentages as between sales for domestic and for other purposes. My notion is that with Commonwealth Edison Company approximately 30 per cent of its revenues are derived from sales to residential customers, 20 to 25 per cent from sales to commercial customers, and 30 per cent or so from sales to industrial customers. The usual contracts of electric utility companies with respect to large sales of power under the industrial classification are firm contracts of either 3, 5, or 10 years duration. That, in my opinion, is the situation with respect to the sales of Commonwealth Edison Company. I would not attempt to say what proportion of the industrial load is sold under the two-year, three-year, or five-year contracts. Any man would have to be an encyclopedia to attempt to remember those figures. I certainly know something about that company. I have made many analyses of that company and purchased millions of dollars of bonds of the company extending over a substantial period of years. I know the general nature of its contracts. I cannot remember myriads of statistics such as you are asking for. I have examined a contract between that company and an industrial customer. I don't remember which one. I don't remember whether I examined the contract between the Edison Company and the Illinois Central Railroad.

Questions by the Examiner.

I have made a number of investigations of the Commonwealth Edison Company probably starting in 1929. At the Equitable, we were a large holder of the company's securities, and from year to year we purchased additional amounts of bonds. The examination and checking of contracts would be one little detail in a broad investigation of the company's operations. The fact that an industrial consumer is using electric energy gives the supplier of that energy more of an assurance than if the supplier were a natural gas company, because of the type of equipment the industrial consumer has to install and the difficulties of changing to any other fuel. A company like the Commonwealth Edison Company obtains a contract or makes an arrangement with a company like the Illinois Central Railroad to furnish it energy; and the Illinois Central Railroad would have installed, perhaps, a receiving substation with transformers, and after that maybe hundreds of motors and lights where the energy would eventually be used. A large customer like that, however, could install its own Diesels or something of that kind, of course, but the installation of Diesels is, from the standpoint of capital investment, an expensive proceeding; and from the standpoint of technical operation is difficult. An industrial customer who is to be supplied with gas in most cases already would have equipment where fuel is now being

used to generate heat, in most cases coal-fired boilers. The gas company comes to him with a proposition and says "We would like to sell you gas; it will be simple for you to install a gas jet under your boiler and make
1274 the change-over, and it will be economical for you."

The cost of that change-over is not much. The costs of change-over to and from electric use are much more. You can see that the installation of a Diesel plant for use in the electric field would be much greater in cost than the installation under a boiler of a simple gas burner.

Generally speaking, large industrial concerns do not generate their own electricity. There has been over the last twenty years a gradual decline in the number of separate installations whereby industrial establishments generate their own electrical energies. There have been ups and downs in that movement, depending upon the course of fuel prices and the activity of manufacturers of such equipment; but generally speaking, the number of power installations in industrial establishments has had a downward trend. The electric companies find the industrial load a good load. Gas companies find the industrial load a good load too. Any load is a good load that provides revenue. My only point was that the margin of profit in the industrial business is less in relation to sales price than it is in the firm business.

Cross-Examination by Mr. Booth Resumed.

The Commonwealth Edison Company sells electric energy to transportation companies such as Chicago Rapid Transit Company and the Chicago & Milwaukee Railroad. Some of the companies who purchase energy from Commonwealth Edison Company have been in receivership or Section 77 proceedings. I am not sure that all of the bills have been paid. I have some recollection that the Edison Company was forced to write off losses on account of energy sold to transportation companies now in receivership, but I don't know the exact amount. I don't know that defendants have been forced to do that.

I just cannot take a position on the question of whether, generally speaking, the industrial load of a gas company is substantially smaller than the industrial load of a large electric company. I think I have a fair understanding of the statistics of these industries but I cannot answer that.

The only way to answer that question as to whether the industrial load of these companies constitutes a large or small percentage of the business of large electric companies and large gas companies would be to look at the whole industry. In 1938, the total revenue derived from sales to industrial and commercial customers in the manufactured gas industry in the United States, and that covers companies providing manufactured service and mixed gas service, was $69,000,000. The total revenues in that year were $360,000,000; so something less than 20 per cent of the gross operating revenue of the industry was derived from sales to industrial and commercial customers. I do not have the comparable electric figures here; but I believe that they would show a somewhat higher per cent of total revenue in the electric industry derived from sales to its industrial and commercial customers, I would say 50 to 60 per cent, I believe.

To the extent that we can generalize on a thing of that kind, I would be willing to say that in the last depression, or the depression that started in 1929, the industrial revenues fell off percentage wise at a faster rate than the revenues from domestic service. That is generally true in the course of a depression or decline in business. I would not say that the risk would probably be greater in the case of electric companies than it would in the case of gas companies. The gas sold by these companies under the boiler fuel and interruptible supply contracts is in many if not in most cases sold in competition with other fuels such as coal and oil, where the margin between the respective costs of the two fuels is very, very close; and it may be that a simple question as to the ease of use or a fractional change in the price will decide whether
1275 or not that customer will continue to take gas. With conditions of sales of that character, it seems to me that any change in the industrial conditions or any change in the conditions of cost of supply of other fuels where the margins are so thin, is a substantial factor to take into consideration in looking towards the risks that are inherent in an enterprise of this kind. Of course, as you say, the situation can work both ways. The price of other fuels might comparatively be greater than the price of gas, so as to give the gas an even greater advantage in the competitive market at a particular time.

I don't know whether the present trend of coal prices is likely to be upward. I think I was in Washington when the Coal Commission was created and the coal laws were passed. I read that there are proceedings pending before the Bituminous Coal Division of the Department of the Interior involving the establishment of coal prices for the entire country. It is my understanding that no findings have been handed down and no coal prices have been established yet in the respective areas. It is not my opinion that in the absence of a definite act of the legislative or congressional agencies actually changing the status quo that the possibility of some action is not a factor to be considered in the determination of the risks of defendants. It is true that I have considered as one of the risks of these companies the fact that laws might be enacted increasing the taxes of these companies. As to whether it would be appropriate for me to consider a risk the possibility of the Bituminous Coal Commission's establishing in the very near future prices for coal which will increase the competitive position of the natural gas industry as compared with the coal industry, I have to work from a base which to me is reasonable.

I have stated that in my opinion the risks involved in this enterprise are greater than the risks in a gas distributing company. Such a company is taken as a base, as it is; and the risks are evaluated from that point on. So it is inherent that I have taken the gas industry as I see it and as I view its future. I don't know for sure that the natural gas industry's competitive position with respect to substitute fuels is improving. There are a number of factors which might have opposing tendencies. I did state that one of the factors of risk I took into consideration in my study of rate of return for defendants was the fact that a substantial part of the revenues came from the sale of interruptible or boiler fuel gas. The ability of defendants to retain their revenues from that class of business depends upon the price of coal, the price of oil and the price of gas. It does not depend altogether on the price of coal.

As to the present trend of the price of coal, I will have to examine certain statistics that I have as to the recent trend of the cost of coal. The cost of steam coal to large users in Chicago at wholesale in January, 1937 was $4.05. It moved in May to $4.25; in December to $4.35; in May, 1938 down to $4.05 and in July, 1938 back to $4.30, where it has been since.

It is my understanding that the Bituminous Coal Division is engaged in establishing bituminous coal prices for the entire country. I do not know what the marketing experts have recommended. I do not know whether they have recommended any prices. I try to keep informed about those things. It is not true that I try to keep informed only about those things that would increase the risks of the natural gas business. I did inquire about the possibility of taxes being enacted in the next few years. I did not make any inquiry as to whether or not the Bituminous Coal Division or their marketing experts had recommended prices which were substantially higher than the present prices. I 1276 was interested in determining everything that I thought of importance in finding the rate of return for this company. I don't think it of any great importance what a division of a bureau of a department of government had recommended with reference to coal prices. I do not know whether the proposed prices have been approved generally by the coal industry. I am quite confident the producers of coal would like to see high prices established, and I have no doubt that the district boards which represent the producers would like to see high prices. However, I do not consider it of great importance in coming to my conclusion as to the rate of return for these companies that the coal industry, as we have delineated it for this purpose, had approved generally the tentative recommendations of the experts of the Bituminous Coal Division of the Department of the Interior. I would consider that particular of some importance. I would also consider what the people on the other side of the table were saying about it; the consumers who were probably over there in the position of Mr. Booth saying it is too high now. Between them, I would attach considerable importance to that in my ultimate judgment, I think if prices had been established by a board—I would not say that I did not make any attempt to find out one way or the other what the respective sides were doing about that question. The question of coal prices has been something that I have given some consideration to not only for gas companies but for electric companies since the original laws were passed and then kicked out. I read in the newspapers about the proceedings pending before the Bituminous Coal Division, but beyond reading about it in the newspapers, I did not make any effort to inform myself concerning such proceeding; I did not come down to Washington to discuss it with the Board, nor did I write any letters to the Board.

I don't know when the legislature of Illinois meets in regular session again. I seem to remember they meet every two years out there, but I do not claim to be an expert on that. The legislature has to meet, of course, in order to pass a law taxing the sale of natural gas. I have not made any independent investigations to determine whether the state administration has under consideration taxing the production of oil in the State of Illinois. I have read the Chicago papers and taken them in my office to try to keep informed. I know that the recent large increases in production of oil in Illinois are receiving consideration of the state administration. I don't know of any proposals that have been formulated with respect to it. In connection with my testimony, I was certainly quite familiar with the fact that this flush production of oil in Illinois in recent years was a factor to be considered. It had, as a matter of fact, resulted in depressing the price of oil in the Chicago market, and I think that this company probably lost gas sales because of it. I cannot name any individual cases. I have not collected any statistics here on an individual customer basis except on the utility companies.

I intended to include in the rate of return to which I testified compensation for risk. I named the figure that I thought would attract investors, and investors can only be attracted if they are given compensation for the risks which they undertake. On pages 6314 and 6315 I stated, in discussing the risks considered by the investor, "He is primarily worried about whether he is going to get his annual return for the use of the capital and whether he is going to get his capital back when he wants it." I stand by that answer. Possible failure to receive the annual return is one of the risks considered by me and by investors. That is generally true of all investments. I am testifying now as to the rate of return, which, as I view this enterprise, will be adequate to attract capital from an investor. I am making the best appraisal of the risks that I can in setting the figure at a point which I believe will make it attractive for an investor to put his money in. I may have made a mistake; I may be too low or I may be too high. I have stated that the 8 per cent rate of return I named was a fair and reasonable return; that it was intended to cover the risks due to the possible failure of the investor to receive the annual return in a given year. (Objection by company counsel overruled.)

It covers in my opinion, all the risks involved and is 1277 sufficient to attract capital. I believe that the 8 per cent return will compensate the investor for the risks which he is undertaking. The investor in a regulated enterprise is never sure that he is going to get what he hopes to get. If a rate of 8 per cent is allowed by the Commission in this case, there is no clear guarantee that the company is going to earn that much money; but in my evaluation of risk in stating that 8 per cent will be a proper rate of return, I believe that includes compensation for all of the risks which the investor is taking, as I see the problem today, including the fact that he may not get the full 8 per cent. I think it is a general thing which is inherent in all investments in the regulated field, that when an investor invests in this field he knows that his profits are limited. He perhaps believes the field has more stability and is willing to go into it on a basis that seems attractive to him and compensatory for the risks which he is investing; not the general risk which is inherent in all investments, such as breakdown of economic conditions and things like that. My 8 per cent return is based on amortization which is proper to return the capital over the life of the enterprise, whatever that may be. I don't know what that would be and it seems to me to be a function of this Commission to determine what that is.

If we assume that the amortization is fixed on a 16-year basis, and in fact the enterprise only lasts 10 or 12 years, the investors might lose such part of their capital as was not recovered at the end of 10 or 12 years. I think that question has to be answered in the light of what would result in practice. This enterprise is now subject, as I understand it, to regulation. If rates are established based on facts existing today as shown in the record, and an amortization period is set up, it would certainly appear logical in my opinion that if at any other date there was any change in the facts as to the life of the field, that would certainly be brought to the attention of the Commission and other rate proceedings would be in order and some modification would be made so that justice would be done to all concerned. Under the hypothetical facts submitted, if an investor held securities of this company in the form of serial notes which were to mature on January 1st of each year for 16 years, and the business of defendants ended through exhaustion of its fields or for some other reason at the end of 12 years, the investor would lose a part of his capital. Of course in that question you have assumed that the company is capitalized solely through serial notes, that it has not built up cash sufficient to pay off these notes, and that there is no cash available over the period for that purpose.

When a company that has been serving natural gas has to go back to artificial gas, the probabilities are from past experience that their cost of producing heating units in the form of gas will increase. As to whether that would result in a rate increase, I think the rate of return at that time would have to be determined in the light of the then conditions. You ask would the same rate of return be required, assuming all of the facts to be equal except in the first case it was supplying natural gas, and later it supplies artificial gas. There are so many facts to be considered in each individual case that I would not express any horseback opinion. In the absence of specific facts dealing with the detailed phases of the operations of the company under each situation, it is not possible for me to give an intelligent answer to the type of question you have just addressed to me. It seems to me that you are asking me to state offhand here what might be a proper rate of return for a company now serving manufactured gas, and at the same time to state what I considered a proper rate of return for a company now distributing natural gas. I am not prepared to state without knowing more facts just what the rate of return should be in each case. I have reference to facts about the particular company, where it operates, the character of the territory.

1278 I know that Peoples Gas Light & Coke Company is serving a mixture of natural and artificial gas. If that company should cease serving a mixture of natural and artificial gas and started serving straight artificial gas it is impossible to say whether or not they would be entitled to an increase in rates although I don't believe that the rate of return would be greatly different. I have not given consideration in this case as to what an adequate rate of return for that company would be under present conditions. Far less have I given consideration to what its rate of return would be if it went back to artificial gas. Before responding to that question I would want to give detailed consideration to the facts. It is possible for me to generalize on risks, but it is impossible for me to state what an adequate rate of return for a particular company would be under different conditions. You did not ask me to state the amount of the return; you asked me to give the difference and that means, of course, that I have got to know what one would be in comparison with what the other would be in order to state the difference. I have not said that there would definitely be a difference in the rate of return. There might be.

Cross-Examination by Mr. Slaff.

I have testified as an expert in only a few cases. I have never considered that I am trying to break into the field of expert testimony. Our firm was established in 1937, and since then we have been retained in four or five cases. I would not say that we are trying to build up a status as an expert in this field. If cross-examination in these cases takes as long as in this one I am perhaps inclined to give it up. I am not discouraged with what my testimony turned out to be under cross-examination; but I have been kept away from my business a week in this case and I am afraid it will go to the dogs unless I can stay with it more. I don't think I will be adequately compensated for my time but I think I will be compensated. I have no doubt about it. As to the basis of my compensation, in response to a request of the company as to whether I might be available to testify in this case, I wrote a letter to Mr. Hedrick in which I outlined the things that I would propose to do and the investigation that I would propose to make. In that letter I said that our compensation would be on the basis of $100 a day for each partner or for the partner who worked on the case; and in my opinion based on our past experience, that our fee would be not in excess of $2500. The actual time I have spent in this case is very much more than I expected to be required to do, and I feel that I am limited to $2500, and that is why I said that I did not think I would be adequately compensated. I have sent the defendants no bill yet. I do not mean to say that our bill will not exceed $2500 in this case. I don't think I will bill the company for my full time as set out in my letter to Mr. Hedrick, of $100 a day. I think I have a conscience about that, and I will be substantially influenced in presenting that bill by the fact that I gave them an estimate of $2500. As to whether the company requested me to come down here this week while the other witnesses were testifying, I think we discussed it generally among ourselves, and I am not sure whether the company requested me or Judge Morgan requested me, or whether I took it for granted that I would have to be here for cross-examination. I understand in these cases that the witnesses must be available on call. If Mr. Emery's cross-examination had lasted only half a day, I had to be here Monday noon. I was not advised by the company or its officials that they had been advised that I would not be required here until after Monday.

1279 Since I was in the Brooklyn Rapid Transit Franchise Tax Case and cross-examined in that case I have not testified that I went from the General Electric Company to the Central Hudson Gas and Electric Company in the capacity of an executive of the Commercial Department of that company. I think I was an executive in the Commercial Department of the Central Hudson Gas and Electric Corporation. I was with the General Commercial Manager as the Manager of the Lighting Division of the Commercial Department.

I testified in the Brooklyn Rapid Transit Franchise Tax Case that I went to Central Hudson in the capacity of executive of the Commercial Department of that company. I have never indicated anywhere that I was the General Commercial Manager of the company. I now say that I was one of the executives of the Commercial Department of that company.

The First Boston Corporation is a large investment banking organization with headquarters in New York. They do a large underwriting business. We made an investigation and report for that company in connection with the issuance and sale of a large issue of public utility bonds—those of Gatineau Power Company. I don't remember ever mentioning the First Boston Corporation in connection with an issue of the Gatineau Company in my prior testimony. I think I may have mentioned it in another case and you may have gotten it from there. I testified in some other case that I did a job for the First Boston Corporation in connection with an issue of Gatineau Power. I testified under examination by Mr. Dyckman in the Brooklyn Union case, as quoted by you, to the effect that we had recently made an investigation and report for a large banking group headed by the First Boston Corporation in connection with an issue and sale of $62,500,000 of mortgage bonds of the Gatineau Power Company. (Motion to strike testimony with respect to First Boston Company by Company Counsel denied.) There is nothing secret or hidden about that issue or about the fact that the First Boston Corporation headed the underwriting group except to the extent that our report is a confidential document between that corporation and ourselves. The Gatineau Power Company is a utility company which has properties in the provinces of Ontario, Quebec and New Brunswick in the Dominion of Canada. It is a hydroelectric property and does not operate any gas properties.

My understanding is that Ralph Davis, whom I mentioned yesterday, is a firm, although I have no knowledge whatever of the partners, or really whether there are any partners. The organization of Ralph Davis, Inc., or whatever the title is, is a well-known firm of geologists, or Mr. Davis has a large number of employees who work with him and prepare reports on geological questions, particularly with reference to the natural gas industry. They have prepared reports for the Equitable. In many cases where securities are being sold by a firm to an institutional buyer, the latter will denominate a firm from which it wishes a report on the question of gas supply. In most of those cases the cost of the preparation of the report is borne by the company who is selling the securities, but the report is primarily prepared for the buyer of the securities. Under such circumstances the firm of geologists would have the status in its field of an independent counsel giving an opinion as to the legal validity of the issue. I think Ralph Davis prepared a report which was received by the Equitable when we purchased the $4,000,000 of bonds of the Northern Natural Gas Company.

I think the president of defendants is W. A. Jones. Outside of being president of defendants he is one of the chief executives of the Cities Service Company.

I testified yesterday that I had conferred with Judge Morgan on the scope of my testimony. I did not discuss with him the exhibits that were to be put in by other witnesses. There was no discussion whatever of those exhibits. I did not inquire about the general scope of the exhibits that were to be put in by the witnesses. I was given a free hand in the preparation of my exhibits and my testimony. I was not directed by Judge Morgan as to the type of exhibit that I was to prepare in connection with my testimony. It was a matter of no significance to me that my exhibits might overlap with the exhibits of the other witnesses. I never gave that a thought and it did not occur to me. I would like to make it clear, so that there is no misunderstanding, that a few days, three or four days, before I came down to testify on direct, I conferred with Judge Morgan and showed him the information contained in this document, my ex-
1280 hibit on the rate of return, and showed him those papers at that time. I knew the names of the three other witnesses who were to testify on rate of return. I knew their positions in their respective fields. I knew they all lived in New York. I knew that they too would probably produce exhibits on their testimony though I had no knowledge of that fact and gave no consideration to it. I did not care if my exhibit turned out to be an identical exhibit with that of one of the other witnesses. I feel that in my work in this field my reputation and future depends upon my independence and the character of the work which I produce independently of anybody else. I would not care as to whether my exhibit exactly duplicated somebody else's exhibit.

It is my habit in the office to read the S. E. C. releases. I try to keep up with the holding company releases, particularly those releases containing findings and opinions. An S. E. C. release is a mimeographed release to the general public stating the action of the Commission with respect to the particular application before it, and includes in most cases an opinion and findings and order in the case, or a statement of the hearing proposed to be set down, or a compilation of statistics which are regularly released by the Commission. I think that generally covers the field of releases. I am on the S. E. C. mailing list and its releases come regularly to my office. I try my best to keep up with these releases and I think that the informed investor tries to keep up with them, either himself or through some agent. And I think he would naturally read such releases as affect an investment or a potential investment. If he found anything in the release that he deemed important and wanted further information on, he would go back of the release and into the S. E. C. files and records so far as they are available to the public, if it was of sufficient importance to him. I think I have done that.

I testified with respect to my position at the Equitable, which was Engineer Treasurer's office. The ultimate responsibility for the investment of the funds of the Equitable did not rest on me. It was my duty to make reports and recommendations after investigation. I made my recommendations to the Treasurer and I think to the Finance Committee. I have made reports directly to the Finance Committee other than through the Treasurer. I have made many such reports. Reports to the Finance Committee would usually be verbal reports rather than the formal 50, 60 or 70 page written report which would be prepared for the Treasurer and the files of the Investment Department. When the Treasurer got my formal report he went over it; probably conferred with me about it; then added whatever he had to say, if anything, to it, and passed it on to the Finance Committee. He would recommend separately or he would adopt my recommendation, and we might purchase a couple of million dollars worth of bonds on that recommendation. The Finance Committee would consider it and if they wanted any more information from me or advice from me they would call me in. It was the Finance Committee which decided whether the investment was to be made or not. The law puts that responsibility upon them.

I have said that I went on field trips from time to time. I have many times been out on field trips investigating three or four companies where I have been away from New York thirty or sixty days. Yes, I would be riding the circuit, as it were, on a 30 or 60-day trip. We would go down and look at one company for a couple of days, three or four days, and then go to the next and repeat the process until returning to New York. The trip itself would be of relatively short duration, three or four or five or six or seven days would usually suffice for the
1281 ordinary company, during which time I would view the physical property, visit the particular communi-

ties served, discuss with local people whatever I wanted to discuss, collect statistics or order the statistics which I wished, and then I would come back to New York and spend one or two or three or four weeks in writing up the results of my investigation. I think those three or four days or so that I would spend out in the field with a particular company are called horseback appraisals.

(Commission Counsel calls the Examiner's attention to the fact that upon request of members of the Commission's staff Mr. F. C. Hamilton, a witness in this proceeding, refused to permit photostating of the working papers by the Federal Power Commission for use in cross-examination on Exhibit No. 125 and the testimony of Mr. Willard in connection with that exhibit. The working papers were subsequently furnished by the Company.)

Referring to your illustration, I could go out and buy a building personally as an investment. There might be a variety of reasons why I would not want to do that. Because of my personal obligations in connection with other business, that particular building might be subjected to such liabilities by my creditors. Also, the creditors arising out of my ownership of the building might satisfy my obligation to them out of other property. To meet that situation I might organize a corporation and have it purchase the building. Under such circumstances I could advance all of the money necessary for the purchase of the building to the corporation, receive from that corporation all of the stock that it issues, and have the corporation use the money and buy the building. I might have the corporation issue to me 50 per cent of my advances in the form of bonds and receive stock for the remaining 50 per cent. That would not be less risky to me than the first method. I do not see that there is any particular difference in that set of facts than if I issued stock for all of it, because I own all of its securities. If there were other creditors there might be some advantage in issuing a part of the securities in the form of bonds secured by a first mortgage on the building, but we are getting into an involved calculation here. Creditors are of all kinds, and if we had this building organized in that way with the company owning it, it all depends on what kind of creditors they are. You might have creditors whose position was secured by the assignment of a certain percentage of the rents. My position would be safer so far as any creditors of the corporation were concerned, if I have a mortgage on the building representing 50 per cent of my investment and only the balance represented by stock than it would be if I had no mortgage on the building. Also, I could have the corporation issue 100 per cent of my advances in the form of bonds secured by mortgage and receive in addition one share of stock of a nominal value. My position in that case would be the most secure of all the situations that have been mentioned here. I would be entitled to first call on the earnings of that enterprise to the extent of the interest on the bonds and additional trade creditors would have to follow after the payment on the bonds; but of course it must be remembered that in the practical world I am not so sure that that would work, because I would not as the owner of that enterprise fail to see that the creditors were paid because they might put the building into receivership. The investor's first concern is about his own investment and not somebody else's investment, but when we talk about things like that, we talk about clear-cut situations where bonds are not put out to the extent of 100 per cent of the property in the ordinary course. They cannot generally be sold to the public on those terms. In the third situation, where I have a mortgage for 100 per cent of my advances to the corporation, I would have first call on the earnings of the building. I also have a first lien on the proceeds of the sale of the building ahead of all of the creditors.

I stated in my direct testimony that a substantial hazard in the investor's mind in connection with these companies was the possibility of a failure of supply, and at this time I cannot think of one which is of greater importance. I said that I assumed that the field would last at least 15 years. I did not give any particular concern to whether it would last longer than 15 years. I was satisfied, or at least I assumed, that the field would last at least 15 years. I did not assume that it would last longer than that. I have made no independent
1282 check of the probable future life of that field. I
have made the same kind of a check in this instance that I would have made had I been with the Equitable Life Assurance Society and responsible for the recommendation for the purchase of bonds. Yes, an informed

investor about to make an investment would make every feasible check with respect to the probable future life of the source of supply of a company such as defendants'. Investment bankers would, for example, hire the Ralph Davis firm that you spoke of in order to get an opinion which would be made available to investors. That would also be done by an informed investor such as the Equitable Life Assurance Society. That would be done by an informed investor and I have made such an investigation. I testified this morning that such an investor would make that kind of an investigation and that it has been done by Equitable and by other investors.

I hesitate to denominate individual things that an individual investor would do. I, myself, would read all the pertinent S. E. C. releases that I could find. I look at everything that I think of that would be pertinent, and an informed investor would either do it himself or through someone else. If he found anything in a release by the S. E. C. of sufficient importance to justify it, I assume he might proceed further with his investigation. As a matter of fact, one of the chief functions of that Commission is to make available to investors information concerning those about to offer issues of securities for sale to the public.

I am aware of the fact that the Public Service of Colorado has been before the S. E. C. recently. A big issue is involved there. That company's declaration was allowed by the S. E. C. to become effective subject, however, to final decision on the price and terms of sale. I would not say that was a normal route pursued in most orders. I think you know that in most declarations the price is known at the time; but in this particular one it was unusual to allow it to become effective subject to the final approval of the price and terms. Ordinarily, these declarations would become effective under certain terms. The procedure to which you refer is a two-part thing. Usually it is a one part thing. I kept up with this financing of the Public Service of Colorado to the extent that was possible. I read the Commission release or opinion from cover to cover. (Objection by Company Counsel overruled.) It includes some fifty pages or more. I undoubtedly read in that release the statement you have just read therefrom to the effect—"The gas property is a coal gas manufacturing plant. Declarant is presently serving natural gas supplied by the Amarillo field with estimated requirements to last for the next 25 years on the basis of 1937 withdrawals." An informed investor contemplating an investment in this company might well read that statement if it were available to him before he made his investment. He might or he might not normally attempt to seek from the S. E. C. the information on which the Commission based that statement. This issue has been before the S. E. C. for a long time but I think you might say that it has nothing whatever to do with the gas reserves.

Yes, the question of financing by the Public Service of Colorado has been before the S. E. C. since the beginning of 1939 or earlier. The questions involved before the S. E. C., as I understand it, were not these general problems, but the questions as to the relative proportion of the bonds, debentures, and common stock of the financing, rather than anything to do with any investigation or study of the gas reserves. An A-2 statement is a registration statement filed under the Securities Act of 1933 where the securities are being distributed and sold to the general public. The declaration and the accompanying A-2 statement under the 1933 Act contained a letter opinion by Mr. Davis with respect to the gas available to the Public Service Company of Colorado. I don't remember all of the details of the letter, but since the Public Service of Colorado purchases its gas from Colorado Interstate Gas Company, my memory is that Mr. Davis had to go back to the latter and its gas supply, which is from the Canadian River Gas Company. The last named company in turn had substantial acreage in the Panhandle field.

1283 Prior to 1928, the Public Service Company of Colorado operated an artificial gas system in the City of Denver. Some time shortly after that, a natural gas line was extended to Denver and the company's system was converted from an artificial gas system to a natural gas system.

(Company Counsel stated: "Ralph Davis does not work for defendants. We retained him in a special manner last year, but he does not work for the Company. We never have had him in Court for the purpose of computing any estimates of reserves in the Panhandle field. If they want his statement here, we ask them to bring him here as a witness and in fairness we ask that all testimony concerning what he said be excluded until they do that.")

Before I could answer your question as to whether or not an informed investor, seeking the reference to the Ralph Davis report in that release, would make an effort to find out what was in back of that estimate or that statement respecting the life of the field, I would have to have that statement before me and read Ralph Davis' statement. If I were making up my mind about an investment in a natural gas company producing and transmitting out of the Panhandle field, upon reading this statement from the release, I would want more information. I might have obtained the report of Ralph Davis and found out whether there was anything of interest in there that might be of value to me in making up my mind as to the investment that I was going to make. No, it would not have been a difficult job to get that report of Ralph Davis. I could have written down to the S. E. C. and had them send me a photostatic copy or I could have gotten it out of the A-2 filed by the company. The A-2 is the registration statement.

(At this point the counsel for the Federal Power Commission produced a two-page photostat which he described as a photostatic copy of pages 5 and 6 of the registration statement of the Public Service Company of Colorado filed with the S. E. C. and asked that it be marked for identification. At the direction of the Examiner, the document was marked Exhibit 155 for identification. EXHIBIT 155 was offered in evidence and company counsel made no point of the fact that the document was not authenticated. Company Counsel object to document on the ground it was hearsay and incompleted.)

I have no reason to doubt that that document is a copy of an authentic statement of the Davis organization. I do not know whether the statement is authentic or not. I will certainly say that it is my belief that that is a statement of the Ralph Davis organization.

The Ralph Davis organization is a firm of engineers who, according to my understanding, have specialized in petroleum and gas work. I do not think I have ever testified—in fact I am sure that I have never testified—that they were the outstanding or an outstanding firm. They are sufficiently outstanding that the Equitable employs them to get their judgment as to the reserves of a gas field. The Equitable does not accept their statements and amortize their bonds over the estimated life as brought in by Mr. Davis as a general proposition. Davis' statement was satisfactory in certain cases to us at the Equitable.

It appears on page 57 of the A-2 which you here show me, that Mr. Alton Jones was a director and vice president of the Public Service Company of Colorado during the period from September 30, 1938 up to July 13, 1939. A note shows that he resigned as director and officer on July 13, 1939. I do not have any doubt that that document is the Public Service of Colorado A-2.

The form of the document submitted to me is in accordance with the usual form of these A-2 statements and prospectuses. I have received A-2 statements from the S. E. C in the regular course of my business, but I cannot say that any A-2 I have received is the same as this A-2. These documents are tentative. There are all kinds of blanks in the prospectus. They don't become effective until the blanks are filled in. (Examiner refuses to permit testimony to proceed over objections of counsel for the two commissions based upon documents from the S. E. C. which are not duly certified by the S. E. C.)

Redirect Examination by Mr. Morgan.

I have stated here that in making my study and in arriving at my judgment of the proper rate of return, I assumed a life of at least 15 years. I have assumed that the gas supply available to this company will
1284 last at least 15 years. I have made no assumptions
that it would last any longer. The assumption that I have made is that the supply will be available for at least 15 years. If it turns out that the supply lasts 20 years, my opinion at this time as to the proper rate for this company would not be different than the 8 per cent to which I testified. If the Commission finds that the life is longer than 20 years, that finding would not change my opinion as to the proper rate of return.

1285 **ROBERT H. DELAFIELD**, a witness for defendants, called for cross-examination, testified:

(October 28, 1939.)

Cross-Examination by Mr. Booth.

I was not advised by counsel for the company to bring such working papers as I had used in connection with the study I had made on the subject of rate of return for defendants. Mr. Slaff asked me to bring the working papers on one subject. I will be glad to supply the others; but I happen to have no other working papers except the pencil figures from which the exhibit was copied. You are welcome to anything I have. My Exhibit 147 is in three parts. I did not understand that you wanted pencil sheets from which it was taken. I will be very glad to supply photostats of those. You are correct in your statement that my working papers in this case consist of working papers underlying the computations shown in Exhibit 147. You see, for this exhibit there are in reality no working papers except pencil sheets which I will be glad to give you, but they are identical with the exhibit itself. If you wish those I will bring them. There is one working paper of which I have a photostat here which is in reality the detail of the makeup of the capitalization study which I understood Mr. Slaff to ask me for. I brought it in typewritten form, and again, if you wish the penciled paper, I will be glad to furnish it. This is all there is. Of course there are notes made on pieces of paper and computations and things of that sort which are destroyed. I am embarrassed that through some slip I only brought one copy of this photostat; and I ought to have those photostated and as many more copies as you want can be readily made.

As shown by the record at page 5116, I testified that I had studied the profits of businesses in other countries. I would say that that constituted an important part of the study that I made on the subject of rate of return in this case; I don't know that I would say the major part. This study of the earnings of businesses in other countries is just some of the general knowledge that we accumulate from time to time in connection with our business. No special study was made of the earnings of businesses in other countries in connection with the study we made on the subject of rate of return in this case. If you were to ask me to tell you what the earnings of public utility corporations were in half a dozen European countries in 1938, I would not be able to answer, nor would I be able to answer should you ask similar questions with respect to the earnings of industrial corporations in any of the European countries at any time.

You are not quite right in stating that at page 5118 I compared the natural gas industry with the grocery industry. I mentioned the grocery store to show that if you do not permit amortization in an extractive industry it is the same thing as telling the owner of the grocery store that when he finally closes up he cannot have the benefit of the price of the stock of the store. That was the purpose of that example. It was not my intent to compare the risk of defendants with that of the grocery business. I do not now suggest that their risks are similar to those of the grocery business. I do not intend to compare them on the basis of risk. As just stated, the sole purpose of mentioning the grocery store was to show the inequity of omitting consideration of amortization from a gas company operation. To my knowledge there have been no suggestions
made that in determining the rates of the companies
1286 under consideration no provision for amortization of
investment should be made. I know that the question of amortization is in this case. I do not know what defendants have set up on their books annually as amounts for amortization. I am not familiar with the provisions for amortization which have been made by the defendants in the exhibits which have been submitted in this case so far as future operations are concerned. Prior to the time I testified on direct examination, I did not read the testimony of Mr. Floyd Brown or the testimony of Mr. Claude Brown, or the testimony of the company's witnesses on the life of the reserves. I did not read any of the testimony. I have seen some of the exhibits but they made little or no impression on me and I think I am safe in saying that I made no study of any of them.

I stated on direct examination that the rate of return was made up of two elements, pure interest and risk premium. Later on cross-examination my testimony, I think, was to the effect that you cannot fix pure interest based on the measures I have used. It might well be between—I think I said 2.75 and 3 per cent, in which case the risk premium would be 5 per cent in my calculation. I have my testimony on direct here before me. There are no material changes I wish to make in that testimony. There are a few very peculiar and somewhat amusing instances of a confusion of words which I corrected and which I will return to the reporter or give to you. I do not think there is anything which will confuse the cross-examination except on one page, and I cannot locate it now. I have marked it with a pencil.

I testified as appears on page 5175 of the record that I would not necessarily have to divide the pure interest and risk premium 3 and 5, although these are approximately the figures that I did have in mind in coming to my conclusion as to the proper rate of return, 2¾ and 5¼ roughly. I would like to amplify that statement at this point. The difficulty that I am under is that the form of your questions indicate that I fixed a figure, and I think that from the testimony leading up to my statement it is very clear, particularly that with reference to pure interest, that it is impossible to make these figures exactly definite. I do not want the questioning now to make them any more definite than I made them in my direct testimony. I stated there that in my conclusion I did not specifically allocate 2¾ or 3 per cent as pure interest and the rest remaining as risk premium. I still stand by the testimony that I gave on page 5175 of the record. It would not alter my conclusions in any way if it appeared that Professor Dorau disagreed with the conclusion stated on page 5175. I would not change my testimony merely because he might not agree with me.

In my direct testimony, I indicated that in arriving at the amount that I thought might be allocated to pure interest, a pretty good index of that was the return on the total bond investments of the savings banks in New York in 1938. I stated the amount invested there was approximately $2,350,000,000, but it would be impossible to state what bonds made up those investments. That data is available but there are probably thousands of issues. The purpose of using that figure is that in New York State there is one of the most rigid laws governing the investments of savings banks; and the Savings Banks Association, also the New York State Banking Association, annually report the amount of bonds held by all of the savings banks and the return or yield on those bonds. This is taken from one or the other of these reports. The sole purpose is to show the yield on a huge diversified fund in conservative securities. The information as to what bonds make up that investment is available. It is a printed book as large as the

one I am holding up here. It is available and must be here
in Washington. There are two of these reports. This par-
ticular figure was taken from the report issued by the New
York State Banking Association, and that I can and
1287 will gladly furnish. That is a small printed docu-
ment. The book that I had in mind is the annual re-
port of the savings banks operations for the particular
year.

The law in New York which makes bonds legal investments for savings banks, stated in the broadest way, includes, among those eligible, United States Government bonds, bonds, I think, of all of the States in the Union—there may be an exception set forth in a proviso in the law that if there has been a default within a certain period, that bonds of the defaulting State are excluded—the bonds of municipalities within the United States with certain qualifications as to default, and so forth. The bonds of certain railways are included but are qualified, though I don't remember all of the qualifications at the moment. Also included are the bonds of certain utility companies. Until recent years, there was a provision that disbarred natural gas bonds. I think at the last session of the Legislature that was modified. Formerly they had to be bonds of electric utilities or artificial gas utilities. I think the law was modified so that a company distributing natural gas which it did not produce could have bonds which were legal. In the old days, no bonds of a company in any way in the natural gas business were admissible. Real estate bonds are included with, I think, the proviso that a savings bank cannot own part of a mortgage; they must own the entire issue. That again may have been changed in recent years. That covers the field in general. The $2,350,000,000 invested in securities by all of the savings banks of New York would not include any real estate bonds. It would include substantial quantities of Government, municipal, utility and railroad bonds. I think the amount of railroad and utility bonds would be substantial. I cannot state the per cent. As to the natural gas securities, if I did not make it clear, I think the production companies were excluded.

In my direct testimony in referring to the S. E. C. as an agency for giving the public information respecting utilities, I testified that the whole purpose of the Act creating that Commission is to inform the public as to investments and prevent them from looking only at one thing and being uninformed. Before the passage of the Securities Act of

1933, the information available to investors in general was the so-called circular, a one or two or maybe six-page document describing the business and the securities. Under the Securities Act, issuing companies file with the S. E. C. a registration statement such as that discussed yesterday, with a large number of exhibits all of which are prescribed by law and regulation; and in addition to that, a company has to make available to all purchasers of securities a prospectus which in the case of many companies is a document of anywhere from 25 to 150 pages of information about the issuing company. That is what I meant specifically that might be available through that agency. That is intended to give the investors substantial, accurate, reliable information bearing upon the securities about to be issued by a given company. I am familiar with the preparation of these statements. The issuer has a serious obligation to provide accurate and reliable data.

As appears on page 5152 of the record, I was questioned about the natural gas industry as compared with other industries and as to whether or not it is in the formative period or otherwise. In some respects the natural gas industry is a very old industry. There were references to natural gas that I can think of over 2,000 years ago. However, there are elements in the natural gas industry that have only developed within the past 15 years, very important phases that have changed it materially. I would not say unqualifiedly that the natural gas industry is a well developed and well established industry at the pres-
1288 ent time. There have been some unusual developments in the past five years. The thing that flashes first into my mind is the transmission of gas under very high pressures. I believe the highest pressure line was built within the past two years. The pressures I had in mind are 1500 to 1800 pounds. That is a line that belongs to, I believe, a subsidiary of the Standard Oil Company of New Jersey, and runs north and south between the fields in southern New York and northern central New Jersey. It is a new line. I am under the impression that it is an 18-inch line. I am not absolutely positive. It is about 120 miles long.

There is another high pressure line that also has been built within the last year or two, if my recollection serves me right, and that is a line built by a Standard Oil subsidiary from a point near Charleston, West Virginia to a point south of Pittsburgh. That is a high pressure line which I think is a smaller line in diameter, and is constructed to operate at 1,000 or 1,200 pounds. I am afraid that my memory of those figures may not be absolutely exact. That line is about 100 miles long.

There has been a great deal of technical improvement, particularly from an industrial standpoint in gas combustion in the development of high heat furnaces. There has also been improvement both from an appearance standpoint and an efficiency standpoint in household appliances. One of the most important developments that occurred in the five-year period under discussion is the development of air cooled gas refrigerators. The last two mentioned improvements tend to assist natural gas distributing companies or artificial gas distributing companies to sell their product.

The only other development in the matter of transmission is the improvement in compressor engines, which would naturally go with the higher pressures. The transmission business is fundamentally a question of pipe and engines, and you are pretty much restricted to that field for changes. Your question as to whether or not the natural gas transmission and production industry has reached a well developed or well established stage involves too broad a field for me to answer it categorically. The natural gas production and transmission industry has been in commercial operation for about 40 years. Those small wells up east of Cleveland between Cleveland and Buffalo, some of them were connected to pipelines in the 80's. The first natural gas plant in this country that I know of was very small and started in the 60's or about that time. In some respects this industry has shown very remarkable developments in the past 40 years; but if you compare it with, for example, the electric industry it would be my opinion that it has lagged.

The total annual revenues from the sale of natural gas would approximate several hundred million dollars. I should say that there are several hundred companies engaged in that business. Natural gas is produced or sold in approximately 29 states in the Union. I think that is a correct statement. The production or sale may not be substantial in some states but I think it is approximately correct. A great many of these states, however, have been reached within the last ten years in the pipeline development of that period. There has been a period of great pipeline development since 1928. Natural gas is sold in many

of the principal cities of the country. Natural or mixed gas is sold and used at Chicago, Minneapolis, St. Louis, Detroit, San Francisco, Atlanta, Memphis, Dallas, Fort Worth; I can mention also Fort Wayne, Indiana; there are others. I do not know approximately the investment in the industry but it would run into many hundreds of
1289 millions of dollars. It is not a new industry but it has been characterized by tremendous growth in the past ten years, and I am a little afraid to emphasize its stability in view particularly of the early history of that 10-year period. I hope it may show further development in the next few years. I don't want to pick on words, but I do not think that in the light of the facts we have been discussing here that it can be said without qualification that the natural gas business is a well developed, well established industry. I do not consider the aviation industry as yet well established. I cannot feel that the natural gas industry is well established although it covers a large territory and is of service to an enormous number of people. Its history, particularly within the past 15 years, especially from a financial standpoint, indicates anything but stability and anything but establishment.

I testified on direct examination that the pipeline industry "is consequently at the mercy of the seller of gas who is only interested in this company as a means of getting that material. It is in a very weak position where it can not set up a type of rate, for example a retail rate, which might encourage the type of business which this company may need at a given time. That is a great risk." I considered that as one of the risks in arriving at the rate of return for these companies. In applying that observation, I had a particular thing in mind. The househeating rate in Chicago seems to me to be not necessarily for that situation high, but relatively high to attract a large volume of househeating business, and the househeating business comes in comparatively large volumes at given rates. I am not in position to say what rate. The rate in Chicago I believe is 7 cents a therm or 70 cents a thousand, rated on the B.t.u. of gas, or in that range. The rates over the country for similar service may be nearer to 50 cents. Sometimes the 50-cent-per-thousand rate which does not specify the B.t.u. content, might compare with a different rate at a lower B.t.u. content.

The question is not one of the rates of the pipeline company because the rates and volume of sales in the language of the industry depend on the kinds of gas. The "kind of gas" does not mean the different gases chemically but means different uses for the same gas. Gas is more valuable for cooking than it is for boiler fuel; and if a company can increase the use of the most valuable kind of gas that it sells, it should work to the benefit of that company and its supplier. It may not be in any sense a question of the rate between the supplier and the ultimate distributor. I think the price which Peoples Gas Light & Coke Company, for instance, pays for natural gas is a very important element in its operating expenses. It might, but it does not necessarily, follow that a change in the gate rate would enable the distributing company to change its househeating rate. It may not be necessary to change the price paid by the distributor to enable it to change its househeating rate.

If I said that defendants are "at the mercy of the seller of gas who is only interested in this company as a means of getting that material", I made a very careless choice of words. I know, of course, and knew at that time, that the Peoples Gas Light & Coke Company has an investment in this company. I would not say their investment in this company is substantial in relation to their investment in distribution property. The three distributing companies own a little more than 26 per cent of the stock of defendants. That is a substantial interest in these companies, but the question is not the substantial amount of this investment but the relation of this investment to the investment in their own property. That is the important thing. I think my former testimony would more nearly express what I intended to say had I used the word "principal" instead of "only".

Very roughly, taking the three distributing companies, I should say that their investment was over $200,000,000. I would like to be corrected if this is not right; and I should say that their investment in this project was approximately 15 or 18 or maybe 20 million dollars; so you are comparing the risk on the $200,000,000 with the risk on about $20,000,000, and there is no question of the importance to that management as to which end of the business makes money. I presume, of course, they hope to have their investment in defendants profitable. The three distributing companies are Peoples Gas Light & Coke Company, Western United Gas Company, and Public Service Company of Northern Illinois. It is those three companies which together own this 26 per cent plus of defendants securities.

Cross-Examination by Mr. Booth Resumed.

I testified on direct examination that "there has been a drop per customer of consumption from 78,000 feet per annum to about 58,000 feet per annum", in the Columbia system. That was over a period from 1929 to the end of 1938. That is a big system and it may be that there were some minor changes in the thermal content, but there were no changes, I am sure, that would affect the consumption to any degree. These are residential customers I was talking about. There has been a substantial increase in the total number of customers in the system and of the residential customers too. The statistics I mentioned awhile ago had to do with sales to residential customers including space heating and all other sales to such customers.

Question by the Examiner.

There is a great difference of opinion in the industry as to why this falling off of customer consumption occurs. We have made extensive studies. The principal causes apparently are the change in the mode of life—less cooking—improvement in appliances or more efficient use of the fuel during a larger part of the period, and rigid personal individual economy where fuel in any luxury use would be cut out. Also, there has been encroachment of electric cooking, but personally I do not believe that is a major factor in the per customer use of gas.

Cross-Examination by Mr. Booth Resumed.

There was a big increase in the volume of industrial sales in 1937 when industry was active, but a tremendous contraction in 1938 when industry was bad. Industrial sales load, speaking only of the system with which I am most familiar, almost exactly follows the index of business activity. It has increased sharply in 1939. What I meant to say is that in the Columbia Gas and Electric system the industrial consumption usually follows a curve parallel to the general industrial production curve such as the Ayres Index, the New York Times index or the Federal Reserve Board index. I am sure I have seen "The Index" published by the New York Trust Company but I would not say that I am familiar with it. I do not know that I have seen the August, 1939 issue.

I am familiar with a study made by the American Gas Association in connection with domestic and other sales of gas, but I don't know whether that is the one you have in mind. I am familiar with the efforts of that association and the leaders of the industry to reverse the decline
1291 in sales per domestic customer. I am familiar with the disclosure that while between 1910 and 1920 the number of American families increased by about 20 per cent, the number of restaurant keepers during the same period increased by more than 50 per cent, the volume of business of commercial laundries advanced about 55 per cent, and the number of servants employed in homes and domestic establishments decreased by about 14 per cent. It is true that the gas industries have made up some of the load which they have lost in the domestic field, but you see what has happened. The principal reason, I think, that the industry is worried about this situation is that we had a sharp decrease in the most valuable and highest priced section of our load; and it is very difficult to make up the net earnings lost from that by sales of less valuable gas, even in enormous quantities.

Questions by the Examiner.

I am generally familiar with the character of industrial business of the companies supplied by defendants. Before I could answer your question as to whether their industrial load fluctuates as does the industrial load of our system—the Columbia—according to the general industrial index, I would have to make a further study. I think in general the industrial gas load of the nation and the country—there are always exceptions—follows any good index of the industrial activity very closely. The reason is that gas is used very largely in heat treating processes, and that the heat treating processes in turn are used in the industries that make up a huge proportion of the country's total industrial activity—automobile parts, tools, steel, glass, ceramics—that type of industry follows right along with the index of national business activity. As the nation goes so the industrial gas business goes, as a generality.

Cross-Examination by Mr. Booth Resumed.

I testified under direct examination to the effect that there is a further competitive element even under the new Natural Gas Act in that the pipelines are in direct competition with other gas pipeline companies, and that where they simply supply a market and do not have the distribution system, the competitor can lay a line to the edge of that market and does not have to replace a distribution system. I considered that one of the serious risks of defendants in arriving at my conclusion as to the rate of return for these companies.

I stated that I had read the contract between Chicago District Pipeline Company and Natural Gas Pipeline Company and that I was generally familiar with it. I don't think I could recall what provisions I stated I had considered. I think my testimony was that the element of importance was the existence of the contract and not any specific provisions of the contract. I do not know at what price the distributing companies would have to be able to purchase natural gas to make it economically feasible for them to maintain their obligations under that contract. I have made no study of that problem. I have made several investigations of the relationship between the Chicago District Pipeline Company, the Peoples Gas Light & Coke Company and Natural Gas Pipeline Company. This is an operation with which I have been familiar ever since its inception. I do not mean to imply that I have made a study of that relationship within the past year.

I don't remember stating that there have been some new developments of oil in the State of Illinois, but there have been. So far I think the extent of the natural gas development in that area has been negligible. There has been some drilling but I think the results of the drilling have been disappointing to the drillers. Some wells have
1292 been brought in but they are not important. I testified on direct examination in substance that I had considered the risk of this property being reduced in value and use by possible discovery of gas nearer the markets, and that was one of the considerations to which I gave weight in arriving at my judgment of a rate of return. I would like to qualify that by saying, of course, that Illinois

is not the only place where gas could be found near the market. I used that as an example in my answer. It could be found in western Kentucky or eastern Kentucky. Kentucky is one of the largest gas producing states in the Union. The big developments in Kentucky—there were prior developments—took place around 1929 and 1930, the development of the shale formation.

I don't know how much it would cost to build a line from Kentucky to Chicago. The cost is an important factor, of course, but Kentucky is nearer to Chicago than Texas. I don't know how much it would cost approximately. A large volume of gas would have to be available in order for people to put their money into a line from Kentucky to Chicago. At least 150,000,000 cubic feet a day would have to be available. I don't know if that is available in Kentucky now. I think our system could take 150,000,000 cubic feet a day out of Kentucky with our present facilities. I don't think our company would consider building a line to Chicago. We have never considered it that I know of. We have markets of our own but just recently, as an example, a line has been projected from Kentucky to Indianapolis; and I am not sure whether this Commission issued a certificate of convenience and necessity for that purpose. I am not positive of that. Suffice it to say that the line has been projected. If it could be projected to Indianapolis, it could be projected to Chicago, naturally. To the best of my knowledge natural gas is not now sold and used in Indianapolis.

In general, I know what the obligations of the distributing companies are under their contract with defendants, but I am not talking about that. That is not the risk. That is not the question I considered in my determination of the rate of return.

Cross-Examination by Mr. Slaff.

I do not know of any bonds of natural gas transmission companies which are legal in the State of New York. There may be some, but I don't know of any. I don't think that is a legal type of investment. There is more than just the statute; the Banking Department has to pass on the bonds too. I don't know about the Banking Law. You have handed me subsection 13 of section 235 of the Banking Law of the State of New York. This subsection says "bonds of any corporation which at the time of such investment is incorporated under the laws of the United States or any state thereof or the District of Columbia and transacting the business of supplying electrical energy or artificial gas or natural gas purchased from another corporation and supplied in substitution for or in mixture with artificial gas for light, heat, power and other purposes, or transacting any or all of such business provided at least 75 per cent of the gross operating revenues of any such corporation are derived from such business and not more than 15 per cent of the gross operating expenses are derived from any one kind of business other than supplying electricity or gas or electricity and gas, and provided such corporation is subject to regulation by a public service commission or a public utility commission or other similar regulatory body duly established by the laws of the United States or the states in any of which such corporation operates, subject to the following conditions." The conditions set out are the times earned and lack of defaults, and so forth. Section 235 begins essentially: "The investments legal for savings banks in the State of New York are ...." The Natural Gas Pipeline Company of America purchases its natural gas from another corporation.

1293 Qualifying my answer again with the fact that I am not a lawyer and therefore incompetent to interpret the law, I do not see anything in that section that would disqualify the bonds of Natural Gas Pipeline Company of America; but I do not think that is the way it works. What happens is that if you wish to have a bond ruled legal, I think in the early paragraphs of the law you will see that you submit it to the Banking Department, and these are the standards set up for their judgment. I am discussing now the statutory standards, and according to the statutory standards the bonds of Natural Gas Pipeline Company of America would qualify as a legal investment, assuming that they meet the following qualifications that we have not discussed in detail. I understand that by "following," is meant that which follows in subsection 13. The provision with reference to the corporation being subject to regulation indicates that the legislature felt that regulation added an element of stability to the securities of such corporation. I am quite sure there are no pipeline company bonds that have ever been admitted to savings bank investments under that law. I think that the natural gas paragraphs were added at the last session of the

Legislature. The inference might be drawn that the legislature felt that the industry has reached a stability where it satisfies these very rigid requirements of the State of New York permitting the entrance of natural gas securities into the field of legal investments for investments for savings banks.

Referring to my statement on cross-examination concerning the increase in efficiency of compressor engines which has taken place in the last five years as one of the outstanding developments in the industry, but, as before, not qualifying as an engineer, I may add that the modern engines are much smaller, more compact and capable of developing, as I am advised, higher pressures and holding to greater efficiency in fuel consumption, and so on. I have seen engines that have been in operation 30 or 35 years, and they do not even look like the new modern, I would call, vertical engines. It is my understanding, not as an engineer, that these new type engines operate at higher pressures and more efficiency; and that they are capable of producing the higher pressures is the big point with me. You ask if they can do a better job today cheaper than they could five years ago. It is more a different job. They can pump gas to these very high pressures. That is the point I had in mind when I mentioned it. I presume they must be more efficient. I think it must be that there has been an advance in the art as far as compressor engines are concerned. I don't know of my own knowledge. I cannot say there has been a substantial advance in the art except in relation to the higher pressures.

I am a proponent of the retirement theory, consequently I think obsolescence takes place when the machine comes out. I do not know of any other answer I can make to your question as to how I measure the degree of obsolescence which exists in any industry. I recognize obsolescence as an economic factor and I recognize that any machinery advances toward ultimate, complete obsolescence with time, and when it gets to the point of complete obsolescence it should be retired. The advance of obsolescence or the particular extent to which the machinery has become obsolescent must be measured by comparison with more advanced technology.

I have stated that I hoped the natural gas industry would grow in the the next few years, but as a matter of fact I am seriously worried about some phases of the natural gas business. I cannot say I am counting on it growing in the future. The best is a hope. I am not very bullish on the natural gas business.

Our system is planning to do some refinancing when and if the S.E.C. approves the plan we have submitted under section 11 of the Holding Company Act, but that is refinancing, not putting new money into it. Naturally somebody is going to have to put up the money for the refunding operation, and it is not going to be the same investors necessarily who now hold the obligations of our sys-
1294 tem. As to whether or not that indicates that we
anticipate for the future a continued growth for the natural gas industry, I am going to answer that question very fully to be frank. I handle a great many funds as an individual and trustee and investor. I am so pessimistic on the outlook of the entire utility industry including the natural gas business that to the best of my knowledge, except with one or two funds where there is particular reason for it, I do not own or control a single utility security. Fortunately, I do not have to advise investors on Columbia securities. I do not want to be fractious, but does not the Security Act of 1933 practically forbid me from giving any advice on these securities? I just give the S.E.C. the facts and let them judge. I might very well refund an existing issue of $100,000,000 with a new issue of $100,000,000 and feel perfectly confident that that issue would be repaid at maturity and that the investor would receive his interest throughout, and still not look forward to a brilliant or very bright or expanding future for that business. Certainly, I approved the plans that Columbia is making for its refunding operations. Before such plans are put into final effect they have my complete approval, and before the issue goes on the market I will approve putting that issue on the market. Nevertheless, I cannot say that I more than hope that the natural gas business will show growth and development in the future. It is sufficient of a hope at least so that it does not deter me or my Company from issuing or planning to issue in the near future approximately $100,000,000 of securities, which are in a large part dependent upon revenues from the sale of natural gas.

I have said that the sales of natural gas for industrial purposes followed generally the general business curve. I did not include commercial sales. I think the same situation holds generally true in the electric industry too. That is, the power sales follow the general business curve.

I have testified in various rate cases for our system companies, affiliates and other companies. The Columbia Gas & Electric Corporation system is an integrated public utility system. I think I testified in the Cumberland and Allegheny Gas Company case before the Public Service Commission of West Virginia in December, 1938. I testified in substance that "the minimum return required which would preserve the credit of the Cumberland and Allegheny Gas Company and make it possible for that company to advance in competition with other companies and with unregulated companies would be 8 per cent." The Cumberland and Allegheny Company is a part of this integrated public utility system which is the Columbia system.

I believe I testified in March, 1934 in the Cincinnati rate case before the Public Service Commission of Ohio. I believe that was a gas rate case. The Cincinnati Gas & Electric Company which was involved in that case is one of the Columbia which was involved in that case is one of the Columbia system companies, integrated public utility system. I testified in that case in March, 1934, that in my opinion a rate of return of 10 per cent would be necessary. My testimony in that respect was "Yes, sir, we have made such a study of this gas distribution property, and in my opinion a rate of return of 10 per cent would be necessary. That rate of return is the minimum which I believe would be sufficient to support the company's credit and to enable it to compete in the capital markets for the necessary funds to enable it to perform its duties."

I testified also in October, 1937 before the Public Utilities Commission of Ohio in the matter of the Columbus Gas and Fuel Company. That company was a member of the Columbia system; it is now combined with another company, the Ohio Fuel Gas Company. In October, 1937, I testified in that case that a rate of 8 per cent was the least that a company in this type of business should have in order to be able to finance itself in competition with other companies operating in more or less the same territory and operating businesses which all have similar risks. I may have testified earlier, in January, 1937, in the same case. The record you have before you is in the Federal Gas & Fuel Company case. The City of Columbus was

served some years ago by two companies, the Colum-
1295 bus Gas and Fuel and the Federal Gas and Fuel,
both wholly owned subsidiaries of Columbia Gas and
Electric Corporation, and both since consolidated in the
Ohio Fuel Gas Company. I testified to an 8 per cent rate
of return for both of those companies.

I testified in the matter of the Natural Gas Company of West Virginia, the City of Wheeling, before the Public Service Commission of West Virginia, some time in the year 1932. That was a Columbia system company. I believe I testified to a 9½ to 10 per cent rate of return for that company. I originally testified to the 9½ to 10 per cent on my direct testimony in March, 1932 and the cross was the following December.

I, of course, assist generally in the supervision and preparation of testimony in connection with our system when rate cases develop. My testimony is confined to certain subjects such as rate of return. I have very little to do with the valuations. That is an engineering subject, but I ultimately familiarize myself with it and get a general idea. I should say that I always know pretty well in advance of going to the hearing what our staff and myself and all of our officers have decided on as a fair rate base for the company involved. It is extremely difficult to answer your question as to whether or not in any case the fair value at which we have arrived has been less than the plant and property account of the company as stated on the company's books, because in so many of the cases only a segment of the company will come in. My answer must be no, I do not know of any such case; but I am not at all sure that there are not many of them. I could not testify, as a general statement, that the fair value which we have testified to as the best judgment or estimate of the fair value has always or uniformly at least equaled the book figures of the property involved.

In the States of Ohio and West Virginia, which are the only states in which we have had rate cases that I can think of, the general theory is that reproduction cost new less depreciation is the rate base. Under that theory you would be quite apt to come out at less than the book figures. By book figures I mean the net plant and property account. The only fair statement I can make is that there is no relation between the books and the rate base. You can not tie them together. Each one of these cases has the date certain as of which the value is fixed.

The property is then appraised as of that date and the appraisal is supposed to develop the reproduction cost new less the depreciation of the property at that date. I could not say that as a rule the final figure was higher or lower than the book figures. Sometimes it is higher, sometimes it is lower. I think in general it would be apt to be higher; and it would always be apt to be higher in producing companies. The working capital, as a specific item, might be picked out of several places in the books and may not be included in the plant and property account in the books. We, of course, add a separate amount for going concern value. I thought you were only talking about the property account. If everything that we put into the rate base be included, I think that in almost every case it would be higher than the property account on the books would show, because the rate base would include things that are not on the books. I think that the total rate base has always been higher than the amounts reflected by the plant and property account on the books. It always ought to be, in fact. I would expect the rate base to be higher than the plant and property account. I cannot say that it always has been but I would certainly expect it to be. I am not sure as to the relation of the claimed rate base to the gross 1296 plant and property account. I would expect it to be higher, but I am including the whole rate base, the property, working capital, going concern value, cost of financing if we put it in, overhead and everything. It ought to be higher than the gross book value of the property and I would expect it to be. As I said, I am not positive that it always has been.

The rate of return to which I testified in this case was 8 per cent, to be applied to the entire rate base regardless of what the latter was ultimately fixed to be. In other words, there should be, in my opinion, a minimum 8 per cent return on the rate base. Of course I am assuming that the rate base would be fixed at a proper level and not arbitrarily fixed in some other way. I assumed that the Commission would come out with a fair rate and a just rate base. My testimony in all of the cases in which I have testified on the rate of return has been to the same effect. That is true with reference to the Cumberland and Allegheny Gas Company and the other companies. I assume the rate base I believed to be fair in the Cumberland and Allegheny Company rate case was that to which our people testified in that case, and that observation applies to the other cases in which I testified on rate of return.

1297 Columbia Gas and Electric Corporation has pending before the Securities and Exchange Commission an application that the issuance of certain securities be held to be in conformity with Section 11 of the Public Utility Holding Company Act. This application was heard in April of the current year, argued before the Commission in June and the decision of the Commission is pending. One of the purposes of Columbia in filing that application as it did under Section 11 and at the time it did was to get a decision from the Securities and Exchange Commission so that it might thereafter be in a position to go ahead with the refunding operation of which I spoke this morning.

We have been and are currently making plans with respect to that refunding operation. Approximately $90,000,000 is involved, that much of the securities will be issued. I have already testified in other hearings and I have no objection to testifying here that we hope to obtain a substantial reduction in the existing interest rate which is 5 per cent, through a change in the form of the securities. The existing securities mature in large sums at only two dates and we have discussed serial maturities and heavy sinking funds which will entirely change the character of the credit with a substantial resultant saving to the corporation. We expect that if these securities are issued they will be purchased by the public. I hope that at the proper time the credit position of the Columbia system will be such that the necessary capital involved in that refunding operation will be forthcoming from the public.

With the qualifications stated at the time, I testified that in my judgment in each of the rate cases we have had in which system companies have been involved, the rate base was at least equal to or greater than the gross plant and property account. I think in the instance of many Columbia system companies the rate base should properly be higher than the book figure for the gross plant and property account of each such company as we have discussed it. There is a particular reason for that. The reason is that many of these companies have been in the natural gas business for practically the entire life of the natural gas industry. Their gas-producing lands in some instances are on their books at figures which are entirely unrelated to their developed value. They were undeveloped lands bought for $1.00 per acre; and the development and exploration that has taken place in the past 25 or 30 years has entirely changed that value. In some instances, because no development cost was charged into the plant account on the books, revaluations have been made; but in almost all instances those revaluations are separate and I do not include those when I think of the book figures.

I am thinking of the book costs when I say the book figures. When I speak of book figures I mean the plant and property account. I couldn't say that in all cases the rate base for rate making purposes should be at least equal to the book figures in our system. I do not know specifically of any cases in which I say the rate base for rate making purposes should be less than the book figures for the plant and property account for the company. I can't just pick an exception out of the air. I have not considered that problem with reference to nearly all the companies from time to time. I have considered with reference to all of our companies the return we would have to have in order to attract capital and one of the important features in that determination is the rate of return on the base. I have said that in some cases of companies in which I have not testified the rate base should be higher than the book figures for plant and property account.

1298 If you total all the property accounts of all the operating subsidiaries, then I would think that the rate base for the system should be higher than that figure. I just can't be sure. As to some companies in which we haven't had rate cases I don't know. I have no way of knowing the answer to the question you are asking whether it isn't a fair statement of my present judgment that a rate for the system as a whole is equal to the sum of the gross plant and property account of all the utility companies in the System, but I will say this, if it will satisfy the inquiry, that if we could get a fair rate of return under regulation upon the book value of our property, I think we would be very happy and satisfied.

In the case of some companies in our system I think the book costs of plant and property are excessive. An excellent example is the electric property of the Cincinnati Gas and Electric Company. We have never made any claim for a rate base anywhere near the book cost shown by the plant and property account of that company so far as I know. I am not sufficiently familiar with the gas properties of that company to make a statement. I haven't the figures at my tongue's end.

Using very rough figures I would say that the electric property of that company was on its books at between $110,000,000 and $115,000,000. There are two items of intangibles in there, one of $8,000,000, a revaluation, and one of $15,000,000, which is a questionable value. If you take 23 off 115 you get, I think, $92,000,000; but I think that in discussions with the city the highest figure I have ever heard mentioned for a rate base was in the neighborhood of $85,000,000. I think it was nearer $82,000,000 but I would like to say $85,000,000 because I don't remember definitely.

As to whether there are other companies, I think the same situation is true of the United Fuel Gas Company. I have never testified as to the rate base in any of these cases. Other people in our company testified as to the rate base. In one item alone which they testified to in the United Fuel case there is a difference of approximately $20,000,000 in the value of production property as between the book cost and the figures presented in the rate base testimony. In other words, the rate base claimed was that amount less than the figures reflected by the books.

As to the situation in the system as a whole, I just don't know. I can't remember all those figures. I don't know whether it would be a fair statement to say that these rate bases less than gross plant and property account would be compensated for by rate bases which we consider fair and proper at figures above gross plant and property account. It would be a terrific calculation to try to work that out.

No, sir, I have not testified that in every case in which I have testified as to rate of return the rate base was at least equal to or more than the gross plant and property account. I have pointed out the case of the United Fuel where the rate base claimed was not as high as the gross plant and property account. No, it isn't true as to all other cases. It wasn't true in the Cincinnati case. I am not sure that I can say that it is true in all other cases. At the time Columbus Gas and Fuel Company was merged with the Ohio Fuel Gas Company we voluntarily wrote
$5,000,000 off the books. It is off the books now. I as-
1299 sume what you want me to do is to relate the book
figures of plant and property to the proper rate base.
I am just not capable of doing it. I don't believe anybody

in the world could do it. Yes, I am the chief financial officer of this company and of this system, but many of these companies haven't been appraised. I have a very firmly fixed idea as to the rate of return these companies would require on a fair rate base. That is true of each of the companies belonging to our system, but I don't know the fair rate base. Certainly I know that as to some of them the rate base should be higher than the book figures of gross plant and property account.

In a general way I am familiar with the balance sheets and the income statements of Columbia and the various companies making up the Columbia system. You have handed me two documents, the first of which is a printed consolidated balance sheets as of December 31, 1938, which does not give effect to various transactions entered on the books subsequent to December 31, 1938, but which covers transactions as of that date and earlier dates. It contains a reference to note "A" This is the consolidated balance sheet which I believe appears as Exhibit D-A 5 to Columbia Gas & Electric Corporation subsidiaries' U-5-S report. That report covers the bonds registered by the utility companies as required under the 1935 Act.

The second document appears to be a photostatic copy of Exhibit D-B in the same report, which is a consolidated income account for the year ended December 31, 1938. I haven't any doubt that this is a true copy of Exhibit D-B attached to the Columbia U-5-S. I believe I signed the basic papers upon which that Exhibit is based; I would in the ordinary course. I am familiar with these documents.

Referring to the balance sheet, the Amere Gas Utilities Company is a small distribution company in West Virginia with a very small amount of production. The plant account is $858;207.16 and the net operating revenue as of the close of the year ending December 31, 1938 was $21,305. The percent relationship between the net operating revenue and the gross plant and property account is 2.48%.

The Atlantic Seaboard Corporation is a holding company, owning the stocks of three subsidiaries. It also operates a pipeline. Two of the subsidiaries are distribution companies, one is a transmission company and one is the Amere Gas Company. The total gross plant, property and equipment account at the end of 1938 was $8,205,751. The net operating revenues for the same year were $181,644,—a return of approximately 2.21% on the gross plant, property and equipment account.

The Big Marsh Oil Company is really an inactive company, a land holding company. It has some sixty-odd thousands of fixed capital and shows operations at a loss.

The Binghamton Gas Works is a distributing company located at Binghamton, New York, with a gross plant and property account of $3,975,559.84 and net operating revenues of $206,678.03, which is about 5.20 per cent on the gross plant and property account.

1300 The Bracken County Gas Company is a distribution company. It has about $3,600 worth of fixed capital.

The Bridge Gas Company is a very small company owning a river crossing which we lease to outside interests who, unfortunately, have never paid the rent. It has a gross plant and property account of $29,000.

The Central Kentucky Natural Gas Company is a distributing company at Lexington, Kentucky. Its gross plant, property and equipment account for the year 1938 was $2,425,254.32 and its net operating revenue for the same year was $62,973.45, a return of about 2.60% on the gross plant account.

Purely in the interest of saving time, you realize I can't agree to this calculation for it is a dishonest calculation. You are taking gross property, but revenue after depreciation. I don't think that is fair. You either ought to take the net property or the revenue before depreciation. I don't want to tell you how to do it. The fair return, is after provision for depreciation and operating expenses. In saying that this is a dishonest calculation, I mean you are making an improper comparison on the books. The return of an operating utility, which related to rate base gives you the return on rate base for the year, that is after all operating expenses and charges made for depreciation and depletion.

While it is perfectly true that I have testified here today twice that in my opinion many of our bases should be and perhaps some of them would be higher than the book, I want to call particular attention in the interest of saving your time that I have very carefully stated that in my opinion rate base and the book figures are not necessarily related. I am a little at a loss as to the purpose of this.

The Cincinnati Gas and Electric Company is a combination gas and electric company producing electricity and distributing both gas and electricity in and around Cincinnati, Ohio. Its gross plant and property account was

$127,838,314.42 and its net operating revenues for the year 1938 were $5,646,588.87, a return of about 4.42 per cent on the gross plant.

The Cincinnati Gas Transportation Company is a pipeline company bringing gas to Cincinnati from the fields in West Virginia and Kansas. Its plant account is $10,411,301.48 and its net operating revenue for the year 1938, $47,400.75. I am afraid that figure is not indicative, however, because the company has been leased to another company and this figure covers operations for only part of the year, I think. It is only income for the period it operated and I haven't got my facts quite straight.

The Cincinnati, Newport and Covington Railway Company is a street railway operating in towns south of the Ohio River, adjacent to and suburban to Cincinnati. The plant, property and equipment account is $5,212,673.71. It has a net operating revenue of $69,115.67.

The Columbia Engineering Corporation is a subsidiary service company and operates without profit.

The Cumberland and Allegheny Gas Company is a production, transmission and distribution company with a gross plant account of $5,668,758.92, a net operating revenue of $131,862.52, or a return of 2.33 per cent on the gross.

No, it would not be a fair assumption that the plant,
1301 property and equipment account of any one of these
companies that we have gone over, or that we may go over in the rest of the balance sheet, for the entire year 1938 is substantially the same as it was as of December 31, 1938. Some of them have had a great deal of construction during the year. You realize in a great many of these companies a lot of the property in the plant account isn't included in your total utility property and isn't in the rate base at all. It is not related to rates or the utility business. In other words, you get inflated figures some times up here in the plant account. That is one of my difficulties in trying to answer your questions honestly and accurately. I can't relate the two items. In answer to your question as to what I could relate that would give you an idea of earnings on property, may I pick out one that I have testified about? Will you go back to the Cincinnati Gas and Electric Company? I think I said that the highest figure I had heard mentioned as an electric rate base was $85,000,000. It also has, figuring roughly, $17,000,000 in gas properties.

Now, relate that to $5,689,000 and we get 5½ per cent. In getting that percentage, I added $17,000,000 to the $85,000,000.

The Dayton Power and Light is a combination electric producing and distributing company and it distributes gas but does not produce gas. The plant account was $49,216,655.10 and the net operating revenue was $3,416,937.22, or a return of about 6.94%.

The Eastern Pipe Line Company owns a small section of the pipeline which it leases and I am not sure it doesn't lease it for taxes. I don't think it makes any money.

Fayette County Gas Company is a small producer and distributor of natural gas. The plant account was $2,332,776. The operating revenue was $155,597, a net percentage relationship of 6.67 per cent.

Gettysburg Gas Corporation is a distributing company with a fixed capital of $586,331.63, net operating revenues of $14,859.95, or a percentage relationship of 2.53 per cent.

Greensboro Gas Company is a producing and distributing company with some small transmission facilities. The property account was $13,097,522.67. Here there is a substantial amount of revaluation which you have to consider in the rate base. I don't remember the amount but it is a good many millions of dollars. The net revenue was $203,842.68 and the net return 1.56 per cent on the plant and property account. I think the plant and property account should be cut approximately in half, which would double the rate. Our rate of return at this rate would be approximately 3.12.

Hamilton Service Company is an electric company and it does not distribute gas. I think it is purely electric. Its plant and property account was $870,554.55 and it operated at a loss. There was a municipal plant in Hamilton, 1302 Ohio, competing with this plant. Municipal competition is a risk that transmission companies do not have. There are lots of municipal gas plants, distributing gas, lots of them through Ohio. You ask whether defendants have that sort of competition. I have a very strong recollection of a line which was projected by the Secretary of Interior from the Texas fields to northern Ohio within the last year or so. That is the worst kind of competition. It hasn't been built but the threat is there and it is the threat that makes the risk.

This Hamilton Company operated at a loss in 1938 of about $26,000.

Harrison Electric and Water Company is an electric company essentially, with a small water business. Its plant account was $178,744.29, its revenue $18,499.02,—a return of 10.35 per cent. That may be a company where the rate base is higher than the book figures.

The Home Gas Company is a transmission company carrying gas along the southern counties of New York State. Its fixed capital was $2,247,858.73 and its net operating revenue, $218,371.66, a relationship return of 9.7 per cent. We bought that line to lift and use the old pipe at a scrap price and then subsequently used it as a utility. The reproduction value is higher than the book figure, and I think the rate base should be higher. That would be my guess.

Huntington Development and Gas Company produces some gas but it is essentially a gas land-holding company. It could hardly be said to operate in any substantial way. Its property account is $10,308,745.79. I think it would be entirely proper to skip this company at this point.

Indiana Gas Distribution Corporation is a small distributing company with a plant account of $170,570.57, net operating revenues of $23,820.93 and a return relationship of about 13.97 per cent. In that particular case I don't think the rate base should be higher than the book figures.

Keystone Gas Company is a gas distributing company with gross plant figures of $763,041.40, net revenue of $43,215.31 and a return of approximately 5.66 per cent on the gross plant.

Loveland Light and Water Company is an electric company with a plant and property account of $208,311, net operating revenues of $19,166 and a return relationship of 9.20 per cent.

Manufacturers' Gas Company is a producing and distributing natural gas company with a plant and property account of $4,806,255.04, net operating revenue of $100,788.30, and a return on plant and property account of about 2.10 per cent.

Manufacturers' Light and Heat Company is a producing, transmitting and distributing company with a plant and property account of $57,980,865.80, net operating revenue of $822,963.26 and a return relationship of 1.42 per cent of the formal figure. That is a natural gas company.

1303 Miami Development Company is only a real estate company holding real estate for electric operations, with no earnings.

Miami Power Corporation is an electric transmission line, operating under a lease, I think, though I am not positive. Their operations are not indicative.

Michigan Gas Transmission Corporation has gross property figures of $9,260,046.57, operating revenue of $609,105.20 and a relationship return of 6.58 per cent on the plant and property account. That company is engaged in the transmission of natural gas.

Natural Gas Company of West Virginia is a producing, transmitting and distributing company with a plant and property account of $7,934,593.94 and net operating revenue of $67,741.82, or about .85 per cent of the former figure.

Northwestern Ohio Natural Gas Company is a distributing company with a plant account of $4,461,134.97, operating at a loss of $174,000 last year.

The Ohio Fuel Gas Company is a production, transmission and distribution company with a plant account of $107,368,062.94, net operating revenue of $4,569,359.73 and a per cent return of about 4.26.

Pennsylvania Fuel Supply Company is a producing and distributing company which has some minor transmission facilities. It has a plant and property account of $2,788,667, net operating revenue of $35,784, or a return of about 1.28 per cent on the former figure.

Point Pleasant Natural Gas Company is a small natural gas distributing company.

Union Light, Heat and Power Company is an electric distribution company that distributes natural gas also. Its fixed capital was $8,031,235 and its net operating revenue $433,485, which comes to a return of about 5.40 per cent.

United Fuel Gas Company is a producing, transmitting and distributing company with a property account stated on the books of $90,137,451.54. In the case of that company I have said that I think the rate base should be some $20,000,000 or $30,000,000 lower than the gross plant and property account. Let's say $20,000,000. Its net operating revenue was $3,583,991, or a return of about 3.98 per cent on the former figure. If the $20,000,000 be taken off it looks like the return would be about 5.1 per cent.

Virginia Gas Distribution Corporation is a distributing company with a plant and property account of $1,184,485, net operating revenue of $21,503, or a return of about 1.82 per cent on the former figure.

Virginia Gas Transmission Corporation is a transmission company with a gross plant and property figure of $4,556,210, net operating revenue of $95,143, and a return of about 2.09 per cent.

1304 Warfield Natural Gas Company is a producing company with some transmission facilities. The gross plant and property figures were $13,397,793, the net operating revenues $651,273, or a return of about 4.86 per cent on the former figure.

In each instance where I have stated the gross plant and property figures, those were the amounts as of December 31, 1938, and where I have stated the operating revenues those were the revenues for the year 1938.

For the whole system, the fixed capital plant, property and equipment account aggregates $559,166,379, the total net operating revenues $19,655,196, or a return on the former figure of approximately 3.52 per cent.

The figures for 1937 for the system companies that we have gone over and for the system as a whole were somewhat better than for 1938. The year 1938 was a very bad year. I can't remember the exact difference. It was some millions of dollars. From the 1937 balance sheet which you have handed me, it appears that the consolidated net operating revenue for 1937 was $22,375,000-odd, as against $19,655,000 for 1938. That was the gross corporate income. The balance sheet caption changed between the two years and I can't make a direct comparison to the figures available to me here but I do not think the property change would have been substantial, in any event not substantial enough to affect the relationship and the percentage I will give you. The difference in net operating revenue between the years 1937 and 1938 was approximately $1,272,000, so 1938 net operating revenue was 5.8 per cent less than net operating revenue in 1937. The property and plant account for the two years was substantially the same, or at least sufficiently near the same so that the figures would not be distorted. Applying the increased revenue for 1937, it appears that instead of 3.52 per cent, the approximate overall figure for 1938, the percentage in 1937 would be approximately 3.78.

I have Exhibit 147 before me. I testified at or about page 5134 that "Each one of these average rates, when you come out at the end, may be either cast up from the mean or cast down from the mean. In this instance, it is cast down very heavily, because there is one very large industry, the packing industry, which has not been particularly prosperous in recent years. That is a large capital industry and consequently if it fell below the middle it would tend to draw the whole average down. On page 3 of this exhibit, you will notice that Armour & Company, with a capital of almost $300,000,000, had an average return of only 3.63 per cent during that period. That would tend to draw the whole average down." That would be offset substantially by the investment in Sears, Roebuck & Company and Montgomery Ward whose capital investments are $238,000,000 and $175,000,000 respectively and who had returns of 11.85 per cent and 10.64 per cent respectively.

I stated in my testimony that defendants would be in competition for capital with the companies represented on this list.

The investors in defendants are: The three distributing companies through the Natural Gas Investment Company; the Standard Oil Company of New Jersey; The Texas Corporation; the Cities Service Company; the Southwestern Development Company, and Columbian Carbon Company. I think that is all. I think you are right in saying that the Southwestern Development Company is owned approximately half and half by Mission Oil and Consolidated Oil.

1305 I don't think I have ever heard of the Cities Service system, The Texas Corporation or the Standard Oil Company of New Jersey investing in the radio receiving sets business, nor have I ever heard of the Southwestern Development Co., the Natural Gas Investment Company, representing the three distributing companies or the Columbian Carbon Company investing in that business. I have never heard of any of these companies investing in the business of making auto body ornaments or the business of making glass blowing machinery. I think you could go through the entire Exhibit 147 and my answer would be pretty uniformly the same. I never heard of any of these companies investing in the candy business or the hair tonic business. I think one of them had quite a substantial investment in the candy business at one time. It was not the purpose of this exhibit to show that the owners of this company were investing in the enterprises listed in this exhibit. I couldn't expect them to and I didn't submit the exhibit for that purpose at all or with that in mind.

It is quite possible that among the companies listed on this exhibit only 9 companies had as much or more invested capital than have defendants. I don't know what those 9 companies earned. You asked me what the average rate of return was for these companies which in the year 1938 earned more than the average for the whole period of 7.32 per cent. The answer is 8.6 per cent. You asked another question which I have answered with these figures I have submitted on paper to you. I find on going over my figures that I have made an erroneous explanation of an exhibit when I said that two natural gas companies were removed because the figures were not available. As a matter of fact they were removed because they were financed during the years when the figures weren't in any way comparable and two others were substituted.

In connection with another matter I made a calculation of the returns of the 12 largest companies listed on my Exhibit 147 but unfortunately I haven't the result with me. I have not checked your statement that only 3 companies listed on this exhibit have invested capital coming within a range of 33⅓ per cent either way of the invested capital of defendants, but I could readily imagine that such might be the case. I have never made any comparison of the returns of those 3 companies with the returns of defendants for the purposes of this hearing. We have made a great many calculations and we have based them on size and character of business, etc. Of course that is not the purpose of this exhibit. I didn't consider that at all when I put this exhibit in.

The purpose of using an exhibit like this is to show by as broad a field as possible what the returns on that broad field of business are which investors expect to receive and against which they measure the returns on regulated industry. No investor like Cities Service Company is investing in a $368,000 business making radio receiving sets.

My explanation of the reason these companies are investors in defendants, and this explanation is borne out by the history of the ownership of defendants, is that practically speaking these people who are in the oil business are forced into the gas business which is in a sense a
1306 by-product of the oil business. The reason for that
I attribute to the great risk of the natural gas business. You will notice that there are very few natural gas stocks in the hands of the public. Very few have ever been sold to the public.

No, I never heard of Cities Service or any of these other investors in defendants investing their money in a $700,000 corporation making overalls. I do not know how many of the companies listed in Exhibit 147 have 10 per cent or less of the capital of defendants. I can perhaps put that in reverse by saying that in one calculation I have here, 24 of the companies, including some of the smallest, represent 78.2 per cent of the capital, that is, the 12 largest, 6 medium sized, and 6 of the very small. These 24 companies represent 78.2 per cent of the entire capitalization of the companies listed on the exhibit, which total aggregated $1,984,000,000 in 1936. I haven't determined how many of these companies have 10 per cent or less of the capital investment of defendants. The figures are here, however, and that fact could be determined by inspection.

In the course of my preparation, I have used several combinations of companies and earnings. I looked particularly at companies where I thought there was a close comparison or corresponding nature of risk as, for example, oil pipe line companies, gasoline pipe line companies. After studying those returns, I thought that a broader field gave a better example. I have not, in preparation for this case, combined any of the companies shown in that exhibit, their invested capital, and their earnings, to determine the relationship in any other categories than as an overall category. I have made other examinations and put this one in as being the fairest. This is a weighted average at which I arrived that is, my ultimate figures for each of the years and for the overall period. It is the total capitalization, divided into the total income to get the final figure. That gives you the fairest average of the return on the invested capital.

Yes, I testified that life insurance companies are the largest segment of the institutional market and that unless you know in advance today that the large life insurance companies will buy an issue of this type, your sales problem becomes extremely difficult and almost impossible. The chief interests of life insurance companies and trust funds in making their investments, is the high degree of safety of the investment. I also testified, in comparing a natural gas enterprise with a copper mine or some other mine, that you have a market at one end, the price of which is controlled in the first place, and which you cannot stop serving in the second place. Yes, that is true of any utility industry. I was differentiating between the regulated utility and unregulated industry. This is a hazard of regulated companies.

You must get the full significance of that testimony. I am comparing an industry which has a mining risk at one end and the public utility risk at the other end of the line. Yes, it is true of all regulated industries, that the price of their market is controlled and that they cannot stop serving it. I have so stated. That is equally true of all other regulated utility companies, but when you combine that risk with a mining risk it takes on an entirely different complexion. That was my point.

I testified at page 5149 that the large institutions have never before been buyers of natural gas bonds but that they stepped into the market and created for the period I was talking about a peculiar demand for these securities. That doesn't indicate that their belief today is that the natural gas industry does not face the same degree of hazard and risk that it faced in the past. It does not
1307 indicate that institutional buyers today representing insurance companies as exemplified by insurance company trust funds ~~have~~ any belief that an investment in natural gas securities is not as hazardous as it might have been ten years ago. There is a peculiar circumstance there that has nothing to do with that interpretation. I testified at page 5152 that before the middle 20's the public, outside of those interested in the oil business, would not put any large volume of money into the natural gas business. In the present case, I should say it wasn't desirable to ask the public other than the public or the companies interested in and intimate with the oil business to put money into defendants because of the difficulty and cost and expense of doing it.

At page 5153, I testified that of the nine companies shown in the chart on page 4 of Exhibit 147, seven were either solely distribution companies or had important distribution facilities. Two of those seven companies, namely, Cities Service Pipeline Company and Panhandle Eastern Pipe Line Company, do not have important distributing facilities. If you will look at that sheet which was among the working papers I gave you, you will notice there an issue, I think, of Cities Service Gas Pipe Line Company bonds. In my testimony before the S. E. C. I said that Cities Service Gas Pipe Line 6's, due in 1943, were on a 5.43 basis at recent prices and yields. Those bonds, however, are out of the chart on page 4 of Exhibit 147 after December, 1938. The Panhandle Eastern Pipe Line figures are on that sheet. The yield basis on those bonds was

3.52 when that sheet was made up. The date is right at the top of it. The working sheet shows the issues included at the end of the line as drawn on that sheet, and the markets at that time, which was October, 1939, as you will note from the date on the sheet right across the top.

The only issue of Southern California Gas Company bonds included in the graph are the 4½'s, due in 1961. Those now show a yield as of the present of 4.07 per cent. Southern California Gas Company has outstanding also an issue of 4% bonds due in 1965. The amount is $15,000,000 as compared to $12,500,000 in amount of the 4½ issue which is used. The yield on those bonds is 3.47. I don't know without looking what the call price on the 4½'s due in '61 is. Without looking I don't know whether they are callable. On examining my notes, I find they are callable at 1.04 at the present time. That fact is one of the factors that, to a degree, is keeping the price down and the yield up on those 4½'s. They are under the same mortgage as the 4's. I believe both issues have the same lien on the property. I think the yield on the 4's, to wit, the yield of 3.47 percent, may be a little fairer indication than that on the 4½'s, of the yield on mortgage bonds of that company with that risk. In justice to the exhibit, I want to explain that the 4½ bonds which I think were issued earlier went in in 1931. The 4's were issued in 1935 and we would be inclined not to put in two bonds of one company if we could avoid it. We were carrying on down the same bonds, but I think the 4's at '65 instead of the 4½'s at '61 might be a better index, and if we were starting this exhibit all over again we would certainly try to use that better index. It would change the chart somewhat to make that sub-
1308 stitution. The chart reaches a final result of 4.41 per cent. The substitution would make the yield a little lower. It would cast it down. It would not take away the validity of the exhibit, however.

Questions by the Examiner.

The size of the issues is disclosed on the working sheet I brought in today. It gives all the information. I brought three copies of this work sheet. I will be glad to furnish any number you want. I had only three with me.

Cross-Examination by Mr. Booth Interposed.

I don't know what the actual investment in the natural gas production and transmission industry in this country totals at the present time. I haven't any idea what it is. I would rather not venture an estimate. There are figures, I think, from which official estimates can be gotten. I don't recall ever seeing such a figure but I may have. I know that it is a great deal more than a hundred million dollars but I don't know what it is. I don't know the annual revenues received by all the natural gas transmission and production companies for the year 1938. I haven't the faintest idea what the figures are. I am familiar with Poor's Public Utility Manual. I think it is a reliable source of information. On a figure like that which may well appear there, I would be glad to accept Poor's figure. I would like to go back to the source, which is probably the American Gas Association. Some times there is such a figure in the manual.

Poor's Manual of Public Utilities is an annual publication. There is a section titled "Survey of Electric Power and Gas Utilities". There may also be included a paragraph bearing upon the natural gas industry, but I haven't that paragraph in mind. I don't think that I would necessarily agree with the conclusions of Poor's as to this or that in the industry. I might accept their factual statements and figures as authoritative and reliable. I could not agree whole-heartedly with the statement you read from page 164 of Poor's Manual for 1939 to the effect that "vast new sources of supply with long-lived reserves have been developed in the Southwest and in California within the last decade, allaying fears as to the Industry's life". I think the next statement to the effect that "extensive new pipe line transportation systems have been built to carry this gas to the large population centers, notably those of the middle west and Great Lakes regions", and that "this has opened immense new markets for future exploitation" is an accurate statement of fact. "Exploitation" I would interpret to mean a proper opportunity for more and more business.

I do not agree with the statement you are reading to the effect that "natural gas is clean and has a higher heat value than manufactured gas. Moreover it can be successfully mixed with manufactured gas." That is a broad

generalization. I think you can manufacture gas with just about any heat content you want to. Of course we all admit that it does have a higher heat value than the manufactured gas commercially served and used; but the statement you have read is a loose statement of the very type that made me say that I would not accept the conclusions of the manual. It is true that natural gas had and
1309 does have a higher heat value than the manufactured
gas which has been supplied, but that is not the way the statement you read from Poor's reads. There wouldn't be any question about the accuracy of that statement if it were properly worded.

You have read me a statement from the same source to the effect that in "most localities natural gas is cheaper so that it can compete successfully with coal and oil as industrial fuel", and that "even in the heart of the coal and oil producing regions natural gas is being sought on a price basis. Moreover as costs and prices generally advance with industrial recovery or for inflations, the cost of natural gas should be among the least affected." I think in fairness I should say that natural gas in most instances is chaper from a rate standpoint than any other industrial fuel and probably will continue to be, so long as it is regulated to a point where there is a pressing down of the rate of return and the profit that draws capital and increases the business, which results in such figures as I read for Columbia companies today for Mr. Slaff. All of Columbia's ultimate markets, with some exceptions, are regulated. Those figures and this statement bear out the pessimism that I expressed for the industry earlier this afternoon.

I have given a great deal of attention to the price tendencies of bituminous coal. I haven't definitely arrived at the conclusion that the price is going up; but let's assume for the purpose of your question that it is. When you restrict natural gas to industrial purposes and the price of coal is raised, you place the natural gas pipelines in a more favorable competitive position. But I speak now of our own system and I think that is indicative of the whole industry. The principal competitor with natural gas on a fuel basis is oil, and natural gas as an industrial fuel is valuable because of qualities that neither oil nor coal have in reality. In very fine heat treating, price is not the objective.

Cross-Examination by Mr. Slaff Resumed.

I have before me a copy of my Exhibit 147. You state that one of the copies furnished you showed the total invested capital for the year 1936 to be $1,784,733,843 and ask me if the first 7 should not be a 9. The copy I have here shows a 9 and I can't imagine a sheet with 7 on it. You state that the same copy shows a rate of return of 10.34 per cent and the other copy shows 9.30 per cent. I think the 9.3 is correct. You state also that one of the exhibits shows net earnings before interest in 1937 at $174,030,335, and in another copy $174,128,719. The former figure is correct, I think, and 8.37 is the correct figure for the rate of return for the year 1937. The three-year average rate of return of 7.32 is the correct one. I can't account for these differences in copies. I don't know how it occurred.

1310 H. B. DORAU, a witness for defendants, called for cross-examination, testified:

(October 30, 1939.)

I have a couple of corrections I wish to make. With respect to Exhibit 152, pages 37 and 38 and the supporting tables running to page 49, I would like to make it clear that in the analysis of the quality of financing tractions, railroads and telephone companies as such were excluded, that is, it refers to gas and electric companies and any services which gas and electric companies may in a composite manner be rendering. I think I failed in my description of it to make that clear. In other words, the effort was to eliminate pure or dominantly tractions, railroads and telephone and water utilities. If a gas company is rendering a water service it is in.

Secondly, there is one figure I would like to correct on page 12 of the exhibit. There was an incorrect calculation of the weighted yield of the 18 manufactured gas company bonds for 1933 in which an inappropriate treatment of the third decimal point occurred. It ought to be 7.31 instead of 7.32.

Cross-Examination by Mr. Booth.

My recollection at the time I was testifying about the percentage of public utilities which had not earned taxable income was that such statistics, which I had occasion to refer to seven or eight years ago related to 1930. I was speaking from memory at the time. The reference was to 1930, I am quite certain. That happened to be the year to which I was referring in an entirely independent connection. I was speaking wholly from memory. I am referring to my testimony on page 5624. It is true that taxable income as reported to the government may be zero, despite the fact that a company may actually report substantial net earnings to stockholders.

I have been present here practically every day this week. I took one or two extra leaves but I think I heard substantially everything. I was here for a substantial part of the cross-examination of Messrs. Emery, Delafield and Gilman. I was asked to come down here for a conference on Monday morning and then it was rather expressed as desirable that I stay on. I don't know whether that suggestion came from Judge Morgan; it came out of a group discussion. I would not want to assign it to any particular person; I don't remember.

I cannot say as to how other people felt about my answers on cross-examination if I had not been present here to hear the other witnesses. I have no concern of that sort with respect to the scope of my own direct testimony.

If I understand your question, I divided up my conception of rate of return into certain specific elements. I attempted to envision the total rate of return in terms of the elements which are today recognized in such a total rate of return. Those all appear in my subsidiary classifications.

In connection with my conception of pure interest, I recall that in preliminary cross-examination you
1311 asked me whether or not I had allocated a specific portion of the amount to which I had testified as a fair rate of return to the element of pure interest. I thought my answer to you at that time was fully informative. I recall that you did cross-examine me about that. I recall that you called my attention to an abstract of the testimony in the proceedings before a Master involving the rates of Peoples Gas Light and Coke Company that

had been prepared, but in which you did not have available the questions and the answers. I do not have before me the record made before Master Swisler beginning with page 9272 from which you read a question and my answer as follows: "Then 3 per cent strikes you as being or constituting that part of the 7 per cent which would represent interest?" Answer: "I think it is probably a fair per cent to use for pure interest." I am willing to accept your indication that I did make the answer quoted to the question, although I do not know whether you read all I testified to in that connection.

That was a very extended cross-examination. I might say possibly in amplification of Mr. Booth's remarks that I thought the major part of my own effort was in response to cross-examination and not in direct testimony before the Commission. I remember it was something like a half day of direct testimony and four days of cross-examination. I assume that the question and answer you have read are from the record made before Master Swisler.

At page 5726 of the record in the present case appear questions and answers you have read to me here. Those answers appear to be accurate statements of what I testified. I was not referring to geologists in the singular or a collection of singulars. I was reflecting my impression of geological opinion in general as I see it reflected in the literature dealing with this subject. I have from time to time read the statements of geologists in connection with security issues, some of which I am quite sure, speaking from memory, had to do with the Panhandle field and adjacent fields.

I think I read a prospectus on the Panhandle Eastern Pipeline Company, one I received possibly in July or August of this year. I would like to refresh my memory as to which geologist expressed the opinion contained in that prospectus. It may have been Ralph Davis, I am not sure. (Objection by Company counsel overruled.) I do not believe I could quote the approximate amount of recoverable natural gas that he estimated to be in the Panhandle Field.

I do not believe it is wholly correct to say that before an investor can appraise the risk and uncertainty, he must know the allowed amortization period and the probable life of the field. A great many investors are not in position to ascertain anything of the sort and in my opinion they do not do it. I think the large number of investors probably do more of this sort of thing, namely, they have an impression that there is a degree of uncertainty involved in this situation which they are not competent to deal with, and they just class it as a security having that kind of an element in it. I do not believe that it is necessary to know or have some specific notion as to the probable allowed amortization period and as to the probable life of the field in considering the uncertainty of the exhaustion of the field either from a physical or an economic standpoint.

I think I recall accurately the testimony of some witness that the informed large-scale investor would be disposed to introduce a margin of safety in the life of the bonds against the—I think he said probably the most conservative geologist's estimate that would be offered to
1312 Lim. The phrase "the most conservative geologist's estimate" was not used. I am recalling my impression of the testimony. I cannot point to any place where that phrase was used. I have not read the testimony. I am speaking from memory.

I do not know that it is the practice of the natural gas industry and the principal companies in the industry to employ experts who would testify to a longer life in connection with proposed issues of securities, and a shorter life in proceedings of this character and I hope that is not the case.

I do not believe I read all of the Panhandle Eastern Pipeline Company's prospectus. There is much in those things that does not concern or interest me. I look at most of those things as they come along. A prospectus is a statement under the requirements of the present Security Law which the underwriters have to have available to offer the prospective buyer or purchaser of the security or issue. They are very voluminous. That is the reason why I do not presume to say that I read all that is in such a document.

You asked me whether, if the prospective life of the field is 20 years and the investors are allowed to amortize the investment over a period of 15 years, the risk to the investor is not reduced more than if the amortization period is taken at 20 years. That is a pretty big question. You state that you are not talking about value but the cash that has been put into the enterprise. I could not agree with you in the light of that statement.

I believe that any reduction in the period over which an investor expects to get his investment back, whether present investment or past investment, reduces the risk of an undertaking in which you will get your capital returned to you in the normal course of business in one year, which is a different sort of an investment than the investment in hydro-electric property. I looked at the prospectus of the Panhandle Eastern in the ordinary course of examination of those prospectuses. I attempt to keep a file and look at most of them that come along because it is a subject in which I am expected to be normally informed in the course of my regular duties. I do not recall whether or not there was a statement in the prospectus to the effect that the recoverable amount of natural gas in the Panhandle or Amarillo field was not less than 18 trillion cubic feet as of May 1, 1939. I do not recall whether the figure was 10 trillion cubic feet but I would be surprised if it were. I do not recall seeing a figure as low as that in any of the literature which from time to time I have looked at. I do not want to be misunderstood here. I have relied upon and used no particular estimate of the reserves in the Panhandle field. If you will examine my testimony and the questions preceding the ones you were asking, you will see that the discussion did not depend on any such thing. I do not believe there were any particular figures in my mind when I answered the question. I do not have any particular figure in mind today. I think it would be quite inappropriate for me to assume to estimate. I would not want to say that I remember that none of the literature which I have examined as to the probable amount of recoverable reserves in the Panhandle, contained a figure as low as 10 trillion cubic feet as of either January or May, 1939. I do not presume to remember what the comparative figures are for the identical dates either May, 1939, or January, 1939.

I think if a single investor or a group of investors were contemplating an investment of such a huge sum of money as $50,000,000, it is entirely reasonable that they would try to inform themselves both as to the fundamental geological factors and their possible significance in the economic outworking of such an investment. I believe it would be entirely inadequate for them to come to a conclusion as 1313 to the proper amortization period on the basis of geological estimates.

After arriving at an opinion as to the probable life of the field, the investors should not then arrive at a judgment of the amortization period over which they would expect to amortize the investment. Assuming that prospective investors have arrived at a judgment as to both the economic and physical life of the field and the business, I think they would then be in a position to make an estimate of the proper period for amortization of the investment.

On page 5726, it appears that I stated that I accepted the opinion of geologists and technologists that there were great hazards with respect to the probable physical supply of gas. I think I made that statement. I was speaking collectively on my impression of what the consensus of geological opinion is about the physical predictability of supply in this industry. I have looked at a great many sources from time to time bearing on this. I can not isolate what I did in the period of a couple of months from what I have done since 1917.

I read in the Federal Trade Commission's report about the exhaustion of gas supply and wastage of gas. I do not know whether they quote particular geologists. I think in fact they quote from a report of a committee of a professional. I don't remember the names of those on the committee of that professional geological society. I cannot recall whether I examined or made an effort to obtain any statements that may have been made by the investors or the representatives of the investors as to the probable life of the field at the time they put their money into this enterprise.

I examined a great deal of material and it seems to me that there were articles from professional societies that dated back to about that time. I do not know what the people who put their money into this enterprise did about such estimates. I know who George F. Mitchell is. He is an executive of one of the Chicago companies interested in this project indirectly. I don't know whether he is president of the Peoples Gas Light & Coke Company. He may be president and Mr. Ranney may be chairman of the board, I don't recall which is which. I recall seeing Mr. Mitchell's name in connection with the discussions bearing upon the building of this project. I don't remember what particular aspects he was concerned with. I did not examine any testimony that he may have given before the Illinois Commerce Commission as to the opinion of the investors on how long this project would last. I do not know what his opinion was or is. I did not read the testimony of the geologists employed by Chicago District Pipeline

Company in the case of that company versus Lindheimer as to the probable life of the Panhandle field in 1934. I do not know what their estimates were. I do not believe I read the testimony of the geologists in the present case. I have not read the testimony of Mr. Claude C. Brown. I hope to read it but I have not had the opportunity to do so. I hope to read a great deal more of the testimony than I have had time to read. I have been working under considerable pressure these last few months. Given time, I should carry all of my research a great deal further.

All of the testimony that I have given in this proceeding was considered by me as basic to both companies here involved. I testified at page 5741 to the effect that if there is an intervention of a contractual relationship between those engaged in producing and those engaged in marketing a product whose interests are not common in the matter, there still remains a grave economic hazard, namely, that if the terms of that contract turn out to be other than what is bearable under the economic condiions disclosed, it is very likely to be modified to conform to the economic possibilities of the situation.

I do not understand that the Natural Gas Pipeline
1314 Company of America and The Peoples Gas Light &
Coke Company have a financial interest in common. They have some interests in common. They are commonly interested in the market in Chicago, obviously. When I used the words "interest in common" I meant financial interests. The Peoples Gas Light and Coke Company have more than a financial interest in the success of defendants herein. The Peoples Gas Light & Coke Company, through an intermediary company, has a substantial investment in defendants.

I am not suggesting that the investors in defendants had no economic protection through the contract with Chicago District Pipeline Company. I testified in recognition of a degree of the opposite. I have testified that I considered that it introduced a degree of stability into the relationship. It introduced a very significant amount of economic protection. It would be hardly conceivable that such an arrangement would be entered into, unless there was identity of ownership, without a stabilizing relationship such as a contract.

Questions by the Examiner.

The expression "in common" as it was used here has a particular meaning. You and I have a common interest in something that the two of us are interested in. If you had a mortgage on me, we would not necessarily have a common financial interest in any third party situation. It is the distinction between the loose use of the term "partners" that developed here in the cross-examination and an ownership, for example. If I have an ownership interest in your business, I do not construe that as a partnership arrangement, but if you and I have a common interest in a third party, then we might loosely be construed to be partners in an enterprise even though it is a corporate form of arrangement.

Cross-Examination by Mr. Booth Resumed.

I testified to the effect that the economic and financial analyst is impressed with the fact that the property depreciates more rapidly as it reaches an older average age. I have made no detailed study of the depreciation of these properties. I have looked at their reports which indicate the amounts being charged for depreciation. I think there is such a charge on the reports that I have examined. This answer did not refer to any such study. It was a general statement. I have not made any investigation of the depreciation of the property. I have never done such studies on the properties of any natural gas company. If I may explain that, I am not an appraisal engineer, and I do not make physical life studies, but I have made studies of the results of engineering and other data. I can refer to no specific instance of having done that with reference to a natural gas company.

As I have used the term, "depreciation" means loss in service value. The definition you quote to the effect that "depreciation is the loss not restored by current maintenance which is due to all the factors causing the ultimate retirement of the property" and that "these factors embrace wear and tear, decay, inadequacy, and obsolescence", while good as far as it goes is not adequate in my opinion. The newer classifications of accounts in putting in those terms include the depreciation on account of legal requirements and I think that has got to be recognized.

By "legal requirements", I mean rules and regulations which might prevent property from being used even though it might technically or economically qualify. The definition you have read sounds quite familiar, I may have read it or I may even have written it. I am not suggesting that Chief Justice Hughes copied my definition of the term "depreciation" but we have perhaps thought the same thoughts and read the same literature.

1315 My definition of the term "service value" is economic value in the employment to which the unit of property is put. I do not think that definition is a serious departure from the usual definitions of the term as contained in the uniform system of accounts pretty generally. I think I have in mind one or two things which have not as yet been recognized, or well established. For example, the valuation of depreciation involved in standby equipment which is technologically obsolete but which may nevertheless have significant service value in a composite plant. The Federal Power Commission's system of accounts for public utilities and licensees uses the term "service value" ~~as~~ being the "difference between original cost and net salvage value of an electric plant." That starts with the presumption of original cost which I do not start with at all. Otherwise, I think our ideas are fundamentally the same.

If I may say just a few words to elaborate my position, I would like to add that from a strictly economic standpoint the basis for such calculation is the present value of the property. I appreciate that for accounting purposes that might not be appropriate. The purpose of the system of accounts prescribed by this Commission and other regulatory commissions is to assist the commission in the regulation of the utility; and I would have great respect for that approach because of its administratability, but considerations of administratability and economics are quite different at times.

I used the term "present value" in a relatively simple meaning and in contrast to original cost. The present worth of the property as distinguished from its worth at the time of acquisition. The principal difference there would be the reflection of the present level of values. There may be an actual change in the value of the unit of property such as a piece of real estate. There might be a rise in the price level that would be reflected in the present value. When I say a change in the present value of a piece of machinery or a piece of real estate, I mean something besides change in price level. There may be an actual change in the value as well. The value of the piece of real estate might relatively actually be higher and the price level itself might have moved up.

That might be true in the case of machinery when you have substantial changes. It might also work in the other direction of course. All value is finally relative. I have overheard discussions here and I think some other discussions of determination of cost of replacement of property. I know nothing about that. I never examined them and paid no attention to them. Present value as I have used that term is not the same as replacement cost and as reproduction cost. I am under the impression that defendants have made some estimates in this case as of some date near the present. I have not looked into the matter. I do not know how far they extend into the future. I cannot say it would be unreasonable for them to run over two or three years in the future for the purpose of determining the companies' income. They might go a considerable number of years into the future. It has been done.

If I understand the law of the land correctly, you are under obligation reasonably to project values into the future under the decisions of the United States Supreme Court. I have come to no conclusion as to what I would deem to be the reasonably immediate future, I have stated that I have not examined the estimates that were made by the company as to the cost of replacing or the cost of maintaining this property in the future. Since I do not know what the estimates are, I cannot say whethey there are any costs that are not included in the estimates.

I do not have in mind the figure as to the part of defendants' total investment covered by its investment in the 24-inch pipe line. If I recall correctly, the invest-
ment in the natural gas resources is not an over-
1316 whelming proportion of the whole, consequently the
investment in the pipeline or transmission facilities would represent the major part of the total investment. The investment in the gas reserves and resources as distinguished from the transportation facility would probably amount to between a quarter and a third of the

whole investment and from two-thirds to three-quarters, if I remember correctly, in its pipeline. I do not know how much the company has estimated it will have to spend for replacement or repair of this line.

I have seen the figure showing the amount the company has expended in replacing and repairing the line during the last 8 years but I do not recall it. I would not want to guess at it. I have told you that I do not remember the amounts. I don't know the relationship of those costs to the investment. I saw them as a part of a revenue and expense analysis that I examined. They were given to me in the form of a historical analysis of revenue and expense. My impression is, as I expressed it in the general testimony, that the proportion of the total investment represented by repairs and replacements would probably be smaller in the initial years and rise to higher levels as the property matured. I do not know what the figure for maintaining and repairing the entire line would be, or whether it would be 2% or 5% or 20% of the total investment. I haven't any notion as to that at this moment. My answer applies equally to the company's action operations in the past and to its estimates of cost in the future. I profess no knowledge of the estimates of the future. I have seen the figures as to the past expenditures but I don't know them.

In a broad way, the question of whether or not it is economical to replace any item is a matter of comparative costs. I should add that it becomes a question of cost over a period of time, not cost at the moment. I don't mean that the answer lies in a comparison of the present values of the alternate costs. What I meant by taking into account a period of time was the question of what time you had to get the benefit of any possible relacement. Such a prospective period of time might well influence the question of present value. I have made no engineering examination of any single item of property or of all of the property of defendants, and have made no inquiry to determine whether it would be more desirable for defendants to use depreciated facilities or to replace them. I mean I have made no such investigation in connection with my study in this case.

1317 I testified on direct examination in substance that from an economic standpoint any enterprise which has to produce its wages of capital, its income, by an intensification of its utilization factors is considered as being involved in hazard which would not be present otherwise. That, like the other factors to which I have testified, influenced my judgment in arriving at a rate of return for defendants. I did not mean to imply that the pipeline company had intensively exploited the ultimate market. That testimony definitely applies to defendants. The intensification in the utilization of facilities of the pipeline company may be viewed independently of the intensification of the retail company's distribution. I believe that a company of this sort would be entitled to a lower rate of return if it were earning its wages of capital without engaging in intensive use of its facilities or its investment.

You do not accurately state the idea when you say that if the company were regularly selling 50% of its capacity instead of 90% it would be proper to allow it a lower rate of return. I think that the statement was made in my testimony that a concern which reserved its efforts to taking the cream of the market was, in my opinion, not entitled to the same consideration as one which attempted to exploit the market to its limits, using the term "market" very generally.

I have made some comparisons as to the sales of natural gas pipeline companies to determine the character or the classes of business and classes of sales which each pipeline company has; but I did not want to say that I had looked at all of them to determine that this one is less vulnerable than any of them. A part of the picture is presented by my statement in my direct testimony that one of the risks of this business is that 25% of its total revenue is obtained under interruptible contracts. I do not mean to imply that the interruptible gas is not sold at compensatory rates or anything of the sort. I made no investigation on that point. I do not know what proportion of the total business of the Detroit City Gas Company is represented by industrial gas. That is true also of the Brooklyn Union Gas Company.

I have those figures here as to Peoples Gas Light & Coke Company and the other distributing companies which market the gas sold by defendants for the Chicago area. The statistics are all broken down between residential, general and other consumers, and the interruptible supply and sales to other utilities, which three classes are in the proportion of just about one-third of the total load. These statistics are in therms. I think I have comparative figures in dollars but I do not seem to be able to put my hands on that at the moment. I don't know how the maximum coincidental daily demand of the Peoples Gas Light and Coke Company, Public Service Company of Northern Illinois, and Western United Gas and Fuel Corporation compare with the maximum demand on Natural Gas Pipeline Company at Joliet on the same day. I have no idea.

I recall that I was questioned concerning the falling off in revenues during 1938 as compared with 1937. I do not believe I have a report covering 1939. Yes, I
have an idea as to whether or not they have in-
1318 creased. I would expect that they will be better
than they were in 1938. I do not know how much
better. We have only a part of the year. I did not make a compilation of the comparative figures for 1939 with the figures for the same period in 1937. There are seasonal factors involved. I do not know how the actual figures compared with the company's estimates of revenue and income in 1939. They did not tell me what their estimates were. I do not know what those estimates were. I cannot say that I know that the company made any estimates of revenue for the period 1939 to 1954. I do not know whether they made estimates of net income for that period. I have examined no such estimates. I have made no estimates of my own as to what the company's revenue or income would be for 1939 nor any other period for any class of service. I was not in position to make such estimates.

I testified on direct in substance that it seemed to me that it sums up to the reasonable economic expectation that higher unit costs of production would result in the future. No, I did not examine the company's estimates. That statement was not based on any examination of the company's estimates. I did not testify as to how much higher they would be. I don't know how much higher they would be over the life or the probable expectancy of the life of the operation. I do not know how much higher they will be 5 years from now.

I could not give you the figures on the unit cost as to how much higher the costs of production are today than they were eight years ago. I don't know what they are.

I have seen figures on unit costs resulting from statistical analysis but I never made them.

I testified heretofore in substance that I think the situation is clearly comparable to that of a manufacturer who finds that his outlets, his contact with the ultimate consumer, is only through the buffer of a distributor or a limited group of distributors. That was another factor that I considered, the isolation of the pipeline from the market. I think the word "clearly" might be stricken if the record bears that much change. I think the word is probably a little strong for the illustration I used. (Counsel for the Illinois Commerce Commission states that that is one correction which he will not agree to.)

I do not know the exact sum which the three utilities which distribute gas purchased from defendants have spent for developing new business since the introduction of natural gas by defendants. I am under the impression that the Peoples Gas Light & Coke Company, at least, spent a considerable sum in an effort to develop the market. I do not have the exact figure in mind. I have the impression that the introduction of natural gas gave rise to additional expenditures. Obviously it was more than $10 but I would not want to estimate whether it was half a million, $2,000,000 or $10,000,000. I recall that incident to the change-over, there were probably in excess of a million dollars of expenditure experienced. I did not attempt to ascertain such figure. I made no calculation to determine how much the income of defendants would have been reduced had they borne the expenditures which were paid by the distributing companies for the development of new business and other expenses incident thereto. I think it would have been a figure worth giving attention to.

I have not the figure as to what Peoples Gas spends annually in its advertising and selling expenses. I would not want to guess at the amount.

I cannot answer your question as to whether the management of the Peoples Gas Light & Coke Company is poor or able—with those alternatives. (Objection by Company Counsel overruled.) I don't consider it poor. I think it has competent management.

1319 As to whether it is agressive, that is a relative term. I don't think I could go with you as to that in my understanding of the word "agressive." It is a relative term and in the comparisons I am thinking of, I would say no. I mean in comparison to the Commonwealth Edison

Company of Chicago for example. It is difficult to appraise whether or not it is better than the management of other gas companies. I believe it is better than a great many gas company managements. I think that it is fair to say that this management is outstanding among gas companies. I am not certain that the word "outstanding" should be followed by your expression "as to all aspects." I have the impression that from an operating point of view, it is quite competent although it is in a field I am not competent to judge. I think it is in the field of merchandising and promotion that I would have some reservations.

I have not made a study of the sales effort of the Detroit City Gas Company, the Laclede Gas Company of St. Louis, or any large artificial gas company following the introduction of natural gas.

I do not mean to say that there is no inducement for the management of Peoples Gas Light & Coke Company to develop the market within the city of Chicago for the sale of natural gas or mixed gas. As to whether or not the local distributing companies in the Chicago area are required by their relationship with defendants to develop the market and territory which they serve, the fact that the Peoples Gas Light & Coke Company has an investment in this market is an urge to do what it can with it. The fact that they have a contract to buy gas which contains features which have a tendency to put a bigger pressure on them is a factor. I could not say that the fact that they have an investment in this company is a factor—there is a certain conflict there which probably would have to resolve itself if there were any choice in one direction or the other.

I do not know what dividends the local distributing companies in Chicago have received from defendants, but I doubt very much whether they refused to take any that were made available.

I am not familiar with the dividends the Natural Gas Pipeline Company of America has paid within the last few years. I do not consider that very pertinent. The matter of their paying dividends seems to be motivated by other considerations.

I have testified that in my opinion, an investor in the securities of these companies would be impressed, and should be impressed, with any possibility of direct competition of natural gas from a different source of supply at a shorter distance from the city of Chicago than the 950 miles between that point and the Texas Panhandle field.

I gave consideration to that factor and to the fact that defendants do not have an exclusive franchise. I did not predict where the raiding line would be built from. It is not a question of where there is an adequate source of supply necessarily it is a question of where there might develop an adequate source of supply.

I gathered from my studies that natural gas is being found in increasing quantities in southern Illinois. I understand natural gas has been found in western and southern Michigan—western I believe; that there are substantial supplies of natural gas in Kentucky. I believe other natural gas pipelines run within distances not too remote to make possible at least the building of spur lines in the direction of the Chicago market. I think that is true of Panhandle Eastern which comes within 100 or 120 1320 miles. It is physically possible to build a pipeline anywhere. I meant economically, of course. I do not know what the developments in southern Illinois so far indicate as to the probable supply down there. I am not sure that anyone knows yet. I have not contacted the Bureau of Mines to determine what natural gas is available or has been discovered so far in southern Illinois. I have not contacted the State Geoglogical Survey of Illinois formally. I did not know that there was anything formal in the way of a survey by the State of Illinois. I knew that the State of Illinois has a geological division. I did not know as a fact that that division makes constant studies of oil and gas reserves. I have a recollection of some reports as to the studies, but I don't remember whether they were oral expressions of opinion or whether I read them somewhere. I have read about various people being interested in the fields down there and I know that Pure Oil Company is interested in an important way. I do not know of other companies by name. I do not know whether their rights are confined to oil or what they own.

My understanding is that up to this time the expected reserves in Michigan are not what might be called large. I am under the impression that they are not large enough to supply the city of Chicago. My impression is that they are not large enough for that purpose as yet.

I would not want to say that there is no possibility of the development of a source of supply from southern Illinois or for that matter from Michigan, if things change. Only a short time ago, they had no notion at all of there being any significant supply in Michigan or in that territory.

I do not know how much it would cost to build a pipeline from southern Illinois to Chicago. I am not an estimating contractor. I would not want to express an opinion about that. It is 300 or 400 miles from those oil fields to the city of Chicago. I do not know what it would cost to build a pipeline 300 or 400 miles. I have a feeling that it would depend a great deal upon the kind of a line, the particular circumstances encountered in that territory, and so forth.

Assuming that it is a line like the line of the Natural Gas Pipeline Company of America, I think it would cost more than one or two million dollars. $25,000,000 is probably a bit too high. I do not know what the cost of defendants line was. I don't know what total investment would be required for a line to supply the city of Chicago from southern Illinois. That would be the sheerest speculation.

I do not know what it would cost to build a line from western Kentucky to the city of Chicago. I would not be in a position to make an estimate. I do not know whether the natural gas would have to be obtained from western Kentucky.

I do not know at what price natural gas would have to be made available in order to make it economically feasible for Peoples Gas Light & Coke Company to purchase natural gas from a competing company. I have not had access to the figures that would be necessary to make such a calculation. I do not know what it would be. I have read the contract between Natural Gas Pipeline Company of America and Chicago District Pipeline Company. I would hesitate very much to say that I am familiar with a legal document of that character. I have read it. I have not looked at it since I testified on direct.

I believe I heard Messrs. Gilman, Delafield and Judge
Morgan discuss it since then, but I have made no effort
1321 to check whether the answers were accurate or not. I
was not particularly concerned. (Objection by Company Counsel overruled.) A great many statements that were made here were made with the very careful addition of the observation that they were from knowledge or from estimates and so on, and I would not be in a position to judge.

I have stated that I gave consideration, as one of the elements influencing my judgment, to the possibility of the construction of a raiding or competing line, and I think it is an appropriate element for consideration.

I do not know at approximately what particular price natural gas would have to be bought by people like Peoples Gas Light & Coke Company before it would be economically feasible to buy gas from a competing company in view of the contracts which the distributing companies have with Chicago District Pipeline Company. I am not sure that I could make such a calculation. I presume that gas sold in the city of Chicago would have to be sold through the Peoples Gas Light & Coke Company and the other two distributing companies who obtain their gas from defendants.

People have been known to invest their money in a competing line for the nuisance value of the line. I do not believe anybody would make the investment without the expectation of making 8%, considering the risks and hazards involved.

I cannot say that I know what the investors in this enterprise estimated that they would make as the result of the construction of a single line to Chicago. I seem to recall some early papers indicating the earning possibility of such a line; but they did not express the expectation of the enterprisers in this particular. They indicated what the possibilities might be, as I remember, under different kinds of circumstances.

I know something generally of the early history of the line; but I do not recall that any record disclosed the expectations of the investors. I made no effort to examine the records on file with the Illinois Commerce Commission dealing with the early history of this line. I have heard in the testimony that Mr. Ralph W. Gallagher was an executive of one of the companies interested. I do not know which one. It did not seem to me to be particularly significant as to which one of these companies he was with. I do not know him. Gallagher's name may have been stated in the Federal Trade Commission report which I read. There is a great deal of material there.

You ask whether I know of anyone who would put up money to build a competing line. Mr. Ickes might. He likes the city of Chicago. Mr. Ickes would get the money from the Government. I do not know just what the present status is as to who has charge of federal loans going into projects of that kind. In changes too rapidly for me to keep up with it. I did note in the Federal Power Commission Opinion No. 39, that there are two contemplated gas lines which are looking to the R.F.C. for financing. Those lines have not been built and probably won't be unless they get the money from the R.F.C.

Defendants started their operations about the beginning of 1932. There have been no raiding lines built to Chicago as yet. It has been a bad 8 years. I am not able to state any present source of supply where the reserves are adequate to supply another line to the city of Chicago. I do not know of anybody who would put up the money to build a line to the city of Chicago even if the reserves were adequate. I do not know how much it would cost to build such a line. A line 300 or 400 miles in length would cost several million dollars. I testified that I do not know at what price the Peoples Gas Light & Coke Company would have to buy natural gas in order to make it economically feasible for it to purchase natural gas from such a source. From an investor's standpoint, it is the possibility of such things
1322 happening that must be given consideration. That is an appropriate investment consideration. I do not know what you mean by "particularly threatening." In my meaning of those words, I would not say it is particularly threatening; but it is an appropriate consideration on the part of the would-be investor that defendants are not legally protected in their market. An investor would give consideration to that fact. I think undoubtedly he would give consideration to the practical considerations which envision the supply of natural gas to the Chicago District Pipeline Company and from the Chicago District to the distributing companies. It is an appropriate economic concern of the investor as to whether such a thing could happen.

When I used the expression at page 5788 of the record "particularly threatening and hazardous", I was referring to the particular threat and hazard of direct competition in an industry of this sort. That is what I had in mind. What I said was that "a threat of direct competition is considered particularly threatening". I think this applies to these companies.

I testified that the competition which natural gas finds itself in with such fuels as fuel oil and distillate and coal and things of that sort, is a factor to be taken into account with a company 40% of whose volume is sold for industrial purposes. I considered that as one of the factors in determining the rate of return.

The State of Illinois produces coal. I do not know how much. It is an important bituminous coal producer. I do not know how important. I have not the figures at hand. I do not know how it ranks among the bituminous coal producing states. I consider it quite important. I do not know whether it rates second, third, eighth, or tenth, but my impression is it would rank up with the first four or five on the list. I do not know what the approximate production of bituminous coal in Illinois is. I do not have the figures in mind. I do not know whether it is 25,000 or 150,000 tons. I have no estimate. I believe coal was being produced in the State of Illinois in large quantities in 1930 and 1931 when this line was built. I do not know as to whether the production was as large as it is today. There was some abandonment and some reduction of production in some sections, but I do not know what the over-all result was. I have no opinion as to the total relative production in the two years.

There are uses in which coal is technically acceptable and where its generally lower price would give it a place in the market. There are other uses in which natural gas has clearly technical superiority in application, and there is an area in between those two extremes in which it is a question latgely of alternative cost. The existing facilities for distribution of gas were available before this line was built; and there were industrial customers in Chicago using gas before natural gas was brought to Chicago, demonstrating that there were technical applications for gas, and obviously then for natural gas. My impression is that the use of gas for industrial purposes in the Chicago area in 1938 to 1939 is larger than the use of gas in 1930 to 1931. There has been a substantial increase in my opinion. In a general sort of sense, defendants have done pretty well in building up their business. Calculated on the original capaciay of the line, the load factor the last three or four years has exceeded 100%. Re-calculatel on the new capacity, I think it has been running 89% or
1323 90% and possibly a higher per cent. I believe, on the new capacity it has reached higher levels than 90%. In terms of utilization, I would call that doing very well. It represents very intensive utilization of the line. I was just going to say that I know some that are doing worse.

Some lines have not been as successful in building up the market as have defendants.

I don't believe I have said that one of the factors in determining rate of return is what the investors would expect to make at the time they put their money into the enterprise. I do not understand that it is appropriate to consider the expectations at some past period in a rate of return examination as of the present time. It is appropriate to consider in determining what will attract capital for an enterprise, the expectations as of the present time.

1930 and 1931 was such a hectic economic period that I would hesitate to make an over-all comparison between returns in those years and as of today. The period 1929 and 1930 was one of such substantial liquidation and reorganization of holdings that we consider the returns during those years as of rather doubtful evidence. But the point I hope to make clear is that the thing I think is relevant is the present necessary supply price of capital. What the people who put their money into this enterprise expected when they put their money into it 8 years ago, is not necessarily one of the factors that might be considered here. They might have had expectations which are entirely different from present necessities. The money that went into this enterprise was originally spent over the period 1930 and 1931. Construction started along about August, 1930, and arrangements and agreements with respect to funds must have been previous to that. I think it is a fair statement that the obligations of the investors really arose in 1930.

(At this point, counsel for complainant produced a document described as a certified copy of Exhibit Nos. 2 and 2A offered before the Illinois Commerce Commission in the case designated Docket No. 21170 and requested that it be marked for identification. At the direction of the Examiner the document was marked Exhibit No. 156 for identification.

Counsel for complainant then produced a document described as a sworn copy of a part of the testimony of Ralph W. Gallagher taken before the Illinois Commerce Commission in the case designated Docket No. 21170 explaining Exhibit No. 2 in that case, with the request that it be marked for identification. At the direction of the Examiner, the document was marked Exhibit No. 157 for identification. Objection by company Counsel to questioning from documents marked Exhibits 156 and 157 overruled.)

I understand that Standard Oil Company of New Jersey owns a substantial interest in Natural Gas Pipeline Company of America. I do not know the exact extent of their interest but I understand they are one of the principal investors. Of my own knowledge, I don't know that Mr. Ralph W. Gallagher was designated as representative of the Standard Oil Company of New Jersey. I read a good deal of the reports, but I had no reason for paying any particular attention to that point. I have read Volume 62 of the Federal Trade Commission Report. That report says here that Ralph W. Gallagher represented the Standard Oil Company of New Jersey on the board of Natural Gas Pipeline Company of America, but I paid no particular attention to his name.

1324 The other men on the board were Reid L. Carr of Columbian Carbon Company, H. O. Caster, Cities Service Company, George F. Mitchell, Natural Gas Investment Company, N. K. Moody, Southwestern Development Company, Rodolfo Ogarrio, The Texas Company, and H. P. Sedwick, Natural Gas Investment Company.

In the proceedings before the Federal Trade Commission, the name of Floyd C. Brown of Chicago appears among the appearances.

(At this point, Floyd C. Brown stated for the record that Mr. Gallagher at one time was a vice president and a director of Natural Gas Pipeline Company of America; that he was not certain whether or not Mr. Gallagher was a vice president at the time he appeared as a witness in the Chicago District Pipeline Company case.)

It is not unusual for men before they embark on an enterprise of this character to make estimates as to the investment which will be necessary for the proposed project and probable earnings. Assuming that such estimates were made by defendants, I don't think I should have made an effort to investigate the estimates which they made to determine the return they expected when the money was invested in the enterprise in 1930 and 1931.

I don't say that it would have been better to read Professor Lagerquist. I am not certain that I examined all of the volumes written by various professors and others which deal with the general question of investments. I made an effort to examine a number of them. I prepared an exhibit with quotations from those publications.

Your statement that I made no effort at all to determine whether or not any estimates were made by the investors at the time they put their money into this enterprise is not quite accurate. If it be assumed that representatives of the investors who put their money into this enterprise made calculations and estimates as to the probable investment and earnings of the enterprise during its life, I don't think that such estimates would have any evidentiary significance for the determination of the present necessary supply price of capital. The price at which people were willing to go into it at that time would at that time have been evidence in my opinion. Before I would agree that it is good evidence, I would want to test the nature of the expression of that evidence. If those were the conditions under which it was offered, for example, I would want to assure myself if that was the true expectation. I do not know that Dr. Lagerquist expressed any opinion as to the necessary supply price of capital.

(EXHIBITS NOS. 156 and 157 for identification were offered in evidence.)

I don't know where the price of bituminous coal is going. I am aware of some of the factors there, but I could not forecast the price of bituminous coal. I do not know whether or not the prices recommended by the marketing experts of the Bituminous Coal Division of the Department of the Interior propose increases for the price of bituminous coal. I presume they do. There would not be any point in their activity if they were not trying to get higher prices. I made no investigation of that.

(October 31, 1939.)

I have had no opportunity or occasion to make any
1325 study as to the price at which Peoples Gas Light &
Coke Company would have to purchase natural gas
from another pipeline and still make it economically
feasible for it to comply with the provisions of the contract between Chicago District Pipeline Company and the
Natural Gas Pipeline Company of America. Assuming it
would not be economically feasible for the Peoples Gas
to purchase natural gas from a competitive line unless it
could buy the gas at less than 15¢ per thousand cubic feet,
I am not in a position to judge whether it would be possible for a competitive line to be built. There is gas
which is being sold for certain uses in the city of Chicago
for less than 15¢. I don't know that natural gas is being

sold in large quantities to distributing companies serving in and around the territory in which Chicago is located for less than 15 cents a thousand cubic feet. I don't know whether it would be feasible for a competitive line to be constructed into the city of Chicago if it be assumed that it would not be economically feasible for Peoples Gas to purchase natural gas from a competitive line unless the natural gas could be produced at less than 10¢ per thousand cubic feet. I have no basis for an opinion on that matter. The possibility of such a thing happening is what led me to raise the question; and I think that possibility would raise the question in any investor's mind.

I do not regard such a raiding line as a probability. I think it falls approximately into the realm of what was possible, what might happen. I don't think it is comparable to the possibility of an earthquake; one is a matter of change in human relations and choices of men, and the other is apparently wholly outside the realm of human volition.

The difference is in the basis of such a possibility. I do not think that is the same thing as saying that the two possibilities differ only in degree. In appraising this element, the investor would consider the possibility of a raiding line. I don't think I could interpret the location of the line between possibility and probability in the investor's mind. I do not think there are any places where you can delimit absolutely the line between possibility and probability, but to my own satisfaction there are such places. I think that is implicit in the testimony.

I have testified that I have read the contract between Natural Gas Pipeline Company of America and Chicago District Pipeline Company. I think I should know something about it after one reading. I know that the rate is set up to recognize both the demand and the commodity responsibility. With the demand charge running between seven and eight million dollars of the total charge of approximately fourteen million dollars, the commodity charge ought to be about half the total. I believe the commodity price is about 5 to 6¢ per thousand cubic feet. (Objection by Company Counsel overruled.) My recollection is that the contract provision calls for the payment of a demand charge on 120 million cubic feet of gas. (Objection by Company Counsel overruled.) Assuming that the Peoples Gas Light & Coke Company would have to be able to buy for less than the commodity charge, since it was obligated to pay the demand charge under any circumstances if it bought natural gas from some other source, I don't think it ridiculous at all to suggest that a competitive or raiding line is possible, and this statement is not changed by the circumstances that I have testified that a natural gas pipeline would demand an 8% return before it could get money to build the line.

1326 I don't know whether Natural Gas Pipeline Company makes most of its profit from its interruptible business or not because I don't know where the margin of profits are. I have made no cost analysis. I have testified that the interruptible business is incremental business.

In my testimony, beginning at page 5728, I referred to technical factors as they might influence an economic opinion. In that connection, I mentioned such problems as continuity of service, cost of transporting this gas, technological pioneering of high pressure, size of pipes, freeze-up, operating costs, size and character of the market; problems of technical efficiency, absence of conservation and others. I stated that these were factors which an investor would be concerned about and therefore I was concerned about them. These were factors to which I gave consideration in arriving at my judgment as to the rate of return for these defendants. I believe they influenced my judgment. I think undoubtedly they were given some weight. If I understand your question correctly, I would answer that the considerations there were viewed as those that might be faced by an investor in an industry having these characteristics. I believe probably most of those problems confronted defendants in 1930 and 1931. There may be one or two exceptions as to that, as far as the date is concerned; but I believe they generally reflect the conditions the company faced. I considered them to be evidences of technical problems which an investor would face in that kind of industry. I am not certain that I considered them as problems that would confront a new line rather than one already in operation. I recognized them as being those which were faced at the time this project was started and as more or less present at the present time. I think there is an element of accumulating experience, but I was not impressed with the fact that this line had matured to the point where a very satisfactory experience basis had been established. I believe I have testified in this record that the only thing that should be considered in the determination of rate of return is present day conditions. I believe that is accurate and true as a general principle. In my testimony here I have arrived at conclusions based upon present-day problems, financial, operating and other risk problems, but I gave some consideration to the problems of risk that confronted this company in 1931. I gave a great deal of consideration to these that existed then and continue to exist at the present time.

I testified at page 5728 in substance that the investor who faced the opportunity, if opportunity it be, to invest in this kind of a venture would naturally be concerned with the question as to whether it was technologically feasible to transport gas that distance. He would be concerned as to whether continuity of service could be maintained with sufficient certainty to make the enterprise profitable. He would be concerned about the fact that no one else had previously attempted to transport gas at such high pressures over such distances. I considered that circumstance in arriving at my conclusions. Some of those conditions do not prevail today.

Beginning on the same page, I testified in substance that the major question remaining for the investor would be whether or not the cost of transporting gas such distances, the very length of the haul, would not eat up the advantage of bringing the product to a market as far away as Chicago. Certainly in the absence of any well certified past experience as to what costs are likely to be, not only immediately but over a period of time in which his investment is helpless and fixed, he would most logically put it down as an investment involving such wide uncertainties as to be beyond calculation as to the appropriate degree of risk to be assigned to it. I considered that element. To a very considerable extent it prevails today. The investor probably knows today's cost as determined of transporting gas to the City of Chicago. The investor probably knows the cost for the past eight years more or less accurately. He may know what has been put into the record as to what the cost will be for the next 15 years, but I am not sure he will know what the cost is going to be. (Objection by Company Counsel overruled.)

1327 At page 5731, I testified in substance that I attempted to acquaint myself with the experiences during the period of construction and operation. I recalled as particularly interesting the freeze-ups which developed by virtue of the sudden expansion of certain gases that were ingredients in the gas transported due to the high pressures utilized. That problem confronted defendants in 1931 and I do not understand that the problem of those freeze-ups is considered as solved. They have faced those problems during the past 8 years. I cannot say that they consider that they have successfully handled them. I understand that considerable progress has been made in handling the situation about which relatively little was known at the time. I do not know Mr. Hammerschmidt. I never heard his name. I have not read his testimony. I testified at page 5732; "Thus the effort of reaching high pressures brought with it the thing I referred to as the formation of a type of ice." I don't know that the company has completely solved that problem. I understand they have made progress in solving that problem about which little was understood at the time the enterprise was initiated. I am not an engineer, but I do not admit that I have made no independent study of any of these things to determine how they were handled. I have made no independent study of these technical factors.

At page 5735, I testified in substance that it becomes for economics not a question of whether gas can be transported from Texas to Chicago, but whether it can be economically transported; at what investment cost can it be transported; what will the operating cost be. The problem of investment cost faced the company in 1931. Defendants do not face the problem of the investment cost of the line in existence, today. They might be concerned about the cost of additional investment if they had to make additional investment to salvage the existing investment. I think they will be concerned with that problem some day. It is not a practical concern at present. I have not read the testimony concerning the salvage of the property as a whole.

I testified that "Finally the question becomes also one as to whether the potential market, which is assumed to be there and which may be there, can actually be captured in a short enough period of time to make the undertaking profitable. If an effort of this sort had to go through a five or ten year period of inadequate utilization of the investment before an adequate market was finally developed, the income foregone during that period might be so large that the price which the customers in the future would be willing to pay would never adequately compensate the investment. Thus the time factor involved becomes economically important. The market must be appraised in terms of size, the nature of demand behavior, and how long it would take to be able actually to obtain the market which appears potentially available." That is definitely a problem which confronted the company at the time of the inception of the enterprise and is not of as great concern today. My recollection is that the company was not assured of its market at the time the line was built. The line had been substantially projected before arrangements were made for the market. Defendants knew that the line was built to serve the city of Chicago. The Chicago interests were financially interested in this enterprise.

At page 5737, I testified: "While the existence of a contractual arrangement would in all probability stabilize or establish the limits of the experience, or rather establish the nature of the experience with certain limits, yet ultimately the security behind the investment in a transportation facility of this sort is the security behind the
1328 readily available ultimate market. A contract for the delivery of gas on the basis of an amount which the market will not absorb would undoubtedly be subject to revision or compromise by failure of one of the contracting parties to be able, or to see fit, to continue to assume the burdens of such a contract out of proportion to the possibilities of the market." In making that statement I intended to imply that the contract has been a considerable protection to the investors in defendants. It is the general expectation, that when costs of production fall, producers must offer products at a lower price, or some other producer will enter the field and undersell them.

I recall discussing the wages of capital management as one of the elements of loan interest. I considered that element in my studies in this case. I used as an illustration or example the investor in a real estate mortgage, and in that connection stated that such investor would have to look into the property to see that the taxes were paid, the insurance kept up, and so forth. I think to a greater or less degree, every investor is conscious of the differences among securities in the amount of attention that needs to be given to his investment. I do not think in the case of corporate organization and stock ownership that stockholders ordinarily concern themselves with matters of that kind. I do not know of any case of a stockholder's interesting himself in the payment of taxes and such matters by the General Electric Company. I had occasion some years ago to discuss the number of disgruntled stockholder letters received by the management of a concern. They were wondering whether the management was taking care of all the things that ought to be taken care of. They were worried about their dividends and about saliries, I believe. There were some who were concerned that the salaries to the principal officers might be too high. Investors not infrequently put their securities in the hands of institutions for the performance of these functions. A trustee of a corporate bond issue looks into those things whenever someone urges him to. I believe there has been some complaint with respect to the energy which they have displayed in respect to attending to these matters. I do not say they generally ignore them, but in my opinion they have not been as energetic about enforcing the terms of the bonds as they might have been. I think that is a small hazard.

Cross-Examination by Mr. Slaff.

You ask me if I take full responsibility for the questions that were put to me and the answers that I gave on direct examination. (Objection by Company Counsel overruled.) My answer is I do not believe I could take full responsibility for the questions and answers. I take full responsibility for the answers. I did not read my direct testimony into the record; I used notes. I carefully prepared my direct testimony in advance. Not all of the questions and answers were prepared in typewritten form before I testified; many of them were. I do not believe I can say that the questions were prepared by me. As I recall, I broke up some of the questions into parts. It was suggested that they be broken into parts. I don't recall that I supplied the linking intermediate questions. My answers were rather long. I recollect also that some of the questions had a certain amount of academic and technical language in them. I spent two or three or four days with Judge Morgan in which he asked me questions and I would offer answers. Someone was taking them down as counsel asked them. A company stenographer was there, as far as I know, all the time. There were several occasions when I proposed testimony to Judge Morgan. I think my reactions suggested the lines of inquiry in the shaping of
1329 the examination. I don't remember suggesting that, "It might be a good idea if we explored this field a little further than we had gone," because I do remember Judge Morgan rather clearly indicated or spoke of what

he was interested in. I am quite sure that at such times I did suggest, "That means this to me" or words to that effect. I was given an entirely free hand in the development of my exhibits, but I was not responsible for the scope of the direct testimony.

As to Exhibit 152, I was told to go ahead and explore the field as to the factors which would have, in my opinion, significance as quantative factors in a determination of that sort. I think I had some doubt as to whether I was expected to cover everything. I said that if it was agreeable, I would prefer to put my energies into approaches which were possibly a little different than I had used before in that sort of determination, approaches that would have some by-product value to me, to which there was general assent and agreement given. (Examiner disallows the use of the word "fair" by Counsel for the Commission in questioning the witness.) I accept full responsibility for the preparation of Exhibit 152 and for my testimony about that exhibit. When I turned that exhibit over to Judge Morgan I went over with him very briefly what I wanted to say about the exhibit. I didn't do it comprehensively, I am sorry to say. I felt not the least restrained about anything I wanted to say about this exhibit. I would like to add that at the time I got to that rather substantial exhibit, there was every evidence of pressure against time, and I moved very rapidly and at various points in my testimony interjected that I was trying to save time by short cut explanations which I thought were adequate for an analysis of the exhibit as it stood. I was under that restraint.

I don't recall any questions during my direct testimony bearing on the advantages of the natural gas industry as compared with other industries, or the advantages of this company as compared with other companies from an investor's point of view. Certainly a consideration of the advantages of a given industry or a given company is part of the mental processes of an investor in making up his mind as to the return required by him from a specific industry or a specific company, but he could do that in two ways. On pages 5544-5547 I gave you as complete a list of the books and papers as I had available. I stated, however, that I did not intend it to be necessarily complete.

I am being compensated by the company for the time that I have spent in the preparation of my testimony and in the giving of my testimony and in the conferences and consultations with company people. It would be embarrassing to me in a way that you probably do not think of, to state the nature of my agreement or understanding for compensation; but I am willing to state it if you insist. I do not mean to foreclose it.

At times in my testimony when I have used the term "depreciation," or "provision for depreciation," I have had in mind the same thing that at other times has been referred to here as "amortization" and "provision for amortization." At other times I am not certain that we are talking about the same thing, when I use this other terminology. The term "amortization" is used with respect to the financial affairs of security issues, and I would not want to say that the terms necessarily always mean the same thing. I think an instance of where the two terms are used as having the same meaning is when counsel speaks of amortization of the investment or amortization of the value of the property over the life of
1330 the property, or over a period from now until the
projected end of the property.

I testified at pages 5552 and 5553 that from the standpoint of the economic analyst, it makes no difference as to the rate of return to which an enterprise is entitled whether its securities be in the form of bonds or preferred stock or common stock, or ordinary interest bearing indebtedness like that to the banks. At page 5559 I testified that "I meant to say that the fact to be determined is at what prospective return would capital employ itself if a given enterprise were initiated under present day conditions." In making that statement, I recognize that the investors in one class of securities as compared with the investors in other classes of securities would be influenced by the arrangements under which they make those investments. I merely meant to testify that when you approach the situation from the outside under regulation, that these arrangements that they have made among themselves should not be binding on or a burden on the public. I was viewing the investment as a whole and was speaking of the informed investor.

I cannot categorically answer your question as to whether or not there would be any different return required by the investors if the capital structure of defendants was represented entirely by common stock or by 50 per cent of bonds and the remainder in stock, because in my opinion it would depend very much upon the nature of the financial markets prevailing at the time. The financial markets today seem to preclude the issuance of anything but the highest class bonds. In my testimony on direct I was correlating my general testimony to the economic conditions and markets which exist today. If an investor were today contemplating any investment in a company, I do not believe it would make any difference whether the company were capitalized on all common stock basis, or if it were on a basis of 50 per cent first mortgage bonds and 50 per cent common stock. If defendants were capitalized on a 100 per cent stock basis, I believe the investor would go into this enterprise on an 8 or 9 per cent basis of return. He would offset the extra hazard of being in debt against the added rate of return which he could get from trading on the equity. So far as I know, the overall return ought to be the same. I believe he would go into it just as readily, if conditions were favorable to common stock financing, at the same rate of return as he would otherwise. That whole question turns on what is salable at a given time. There might not be that volume of common stock equity capital available at that time for that kind of an enterprise, and the only way the originator could get it would be to go in debt for part of it. There was no public financing in the case of defendants. Assuming that the business were to be started de novo today with the same investors, my judgment is that they would go into this enterprise on an 8 or 9 per cent basis if the capital structure of the company were represented entirely by stock, unless influenced by the bare possibility that a debt factor in the capitalization might have some tax advantage. Beyond that, with the same people making the investment, it seems to me it is almost a nominal arrangement. They have put all the money in anyhow, and what they label it does not make a lot of difference.

I have been thinking of a couple of other minor exceptions, such as the significance of a debt instrument for collateral purposes under some restrictions, and other minor factors which I do not believe are very important. As a broad over-all statement, if they were willing to go into this thing with a prospect of a 9 per cent return today, I do not see that it would make any difference whether they took part of their investment in bonds and part of it in stock. I think it is straining my testimony a little bit to say that they would be willing to go into it on an 8 or 9 per cent return basis. I said I thought a fair return was

that. Whether they would want to go into it on that
1331 basis is only answerable by them. My conception of
a fair rate of return is the rate at which capital would employ itself if a given enterprise were initiated under present-day conditions. I just wanted to leave the residue of doubt as to whether the 9 per cent actually as a fact would induce this particular group to do it today. I think groups of investors are classifiable. When I was speaking of investors and a fair rate of return of 9 per cent at the conclusion of my testimony, I thought that was a fair and minimum figure to offer as a rate of return. For a group like the owners of defendants, I do not see that it would make any difference whether the enterprise was capitalized entirely on 100 per cent capital stock.

I testified in substance at page 5555 that in my opinion a fair return or reasonable return cannot be ascertained with the same degree of precision as a past return, because the latter is an experienced and the other an expected fact. Since the one involves judgment and imputation for the future, it can never hope to be precise to the same degree that an experienced past fact is. The future rate of return is necessarily a matter of judgment. I would not agree with you that men with equal good judgment and equal integrity, and with an equal desire to be fair and reasonable, can very widely on what is fair rate of return in any given field if they are exposed to the same circumstances and facts. I would be inclined to agree that they might well honestly vary. Men of equal judgment and equal integrity, and with an equal desire to be fair and reasonable, may give different weight to the same factors. One may consider different factors from those others have taken into consideration. Different people are impressed in different degrees by the same factors.

I also testified, beginning on the page last mentioned, that "neither rate base nor rate of return are ultimate ends but on the contrary are but the indispensable means to the important end, namely, the return in the number of dollars." I think it is accurate to say that the return that the investor figures on receiving today when he contemplates an investment is the return on a certain number of dollars which he invests. I am afraid there is a misunderstanding though in the question, either on your part or on my part, namely, I was speaking here of the return to an enterprise, that is, for the enterprise it is a return in a number of dollars. I made that distinction in the beginning of the testimony, that I did not construe the return strictly as going to the investors, but as going to the enterprise, and to that enterprise it is ultimately a number of dollars. Looking at it from the viewpoint of the investor I think it is right, if you envision the investor as being faced with an opportunity to buy an investment at a certain price or leave it, that he determines what return he will be satisfied with when he relates that return to the number of dollars which he invests and weighs out the hazards and uncertainties and favorable aspects of his investment. Then he makes his adjustment with that price as a norm and arrives at the other elements. I agree that the investor I was talking about was the one who had a choice as to whether or not he was going to invest in this project or a project like it, or leave it alone. I merely want to make the distinction between the problem of the return to an industrial unit and the question of an investor's choice along alternative investments. The investor determines the return that he will be satisfied with when he envisions the number of dollars he will get from the enterprise, the hazards, advantages and disadvantages of that type of investment, the number of dollars that he is required to put up in the enterprise.

1332 At page 5557, I testified: "The presumption is that if the return, namely, the number of dollars, which is the vitally important thing, is to be fair or to be arrived at at a figure which would be deemed to be fair, then the two calculations which are necessarily previous to that determination would presumably also have to be fair". I had in mind legitimate processes. Theoretically, you might arrive at a fair return by over-stating the rate base and under-stating the rate of return. The investor has made up his mind as to what he deems to be the necessary return. Inadvertently, I think in the past that has been done. I did not assume that such method was used. To get it down to dollar figures, you state that the investor invests $100 and envisions and is entitled to a $6 return or an $8 return. You suggest we take $6 without prejudice. You ask me if in a regulatory proceeding subsequently thereto, and conditions have remained the same at the time of the regulatory proceedings, the rate base is fixed at $120, whether a rate of return might be fixed at 5 per cent and still return to the investor his fair return. No, I think there is a flaw in that. The $120 may be the present value of the property. I don't know whether that is implicit in your assumption or not. If $100 be the appropriate fair value at the time of the investigation and $120 was inadvertently or purposely conceived, then a lower percentage applied to that $120 would give you the same number of dollars in return as otherwise. The dollars return and not the rate of return is the important thing for the enterprise. I believe the investor might have been misled if such irregular methods were employed. In other words, if the announcement came out that 5 per cent was the rate of return fixed for the natural gas industry, those who read only that far and knew only that much would be horrified, of course, and take a psychological flight from any investment in such an industry. A different situation would obtain if they got all the facts. But the chances are that they usually do not. One who is fully aware of the facts would still be satisfied with the dollars return if they measured up to what he had contemplated as dollars return to begin with, and conditions had not changed. He might well say to himself, "We got this much more in the rate base, and we did not get what we expected in the rate of return; but we came out about even".

My conception of rate of return is that necessary present or annual wages of capital or the present return to capital that would be necessary if the business of this company were to be reproduced, and not that which woull be necessary to attract new capital to the business as that new capital is needed. I think the latter conception is inadequate because it is a matter of my observation and experience that the price at which you can get some new capital in may well be below what a fair rate of return would be. Thus, the owners of the equity might be called upon to make additional sacrifices under pressure for getting more capital in and the enterprise might be able to acquire that at rates which would be quite different. Thus, my conception of the rate of return is the present necessary supply price of capital. My conception of rate of return is the rate that would be necessary if the enterprise were being reproduced or purchased as it stands today in the light of present conditions. I think that either one suffices for practical purposes. My reason for my answer is that I did not mean to imply in this statement that there are theoretical conditions to be superimposed.

If the group of enterprisers were to purchase this business from those who now own it, they collectively would

demand an 8 or 9 per cent return on the value of the
1333 property. If the property did not exist and it were contemplated to reproduce this property, to bring gas from Texas to Chicago as it is now carried, the group of enterprisers who would undertake that business would demand the same 8 or 9 per cent return. That is related to the question of enterprise compensation. I think the two situations would work out the same; and, I believe I have explained that in my discussion of compensation of enterprise.

With respect to my statement that the "experienced past cost of capital of a given enterprise has nothing in particular to do with the present annual value of the capital employed," I was probably trying to recognize what you have in mind with words "in particular." By those words I meant "necessarily as such." I think I stated that if the past cost was known, under substantially similar circumstances, then it would probably be next to the best evidence of a contemporaneous bargain for that purpose, but insofar as it is remote and insofar as the circumstances are different, it fails to be good evidence. There is a distinction between the immediate past and a more remote past, or an immediate past and the present if there has been a violent change of circumstances such as the outbreak of a war, for example.

If this enterprise had offered bonds to the public at the time of its commencement, I rather doubt in the light of the circumstances, whether ~~or not~~ the rate of interest would have been less than the 6 per cent rate which is nominally on the bonds today. The state of the bond market at that time is reviewed in my exhibit and in my testimony in connection with the exhibit. That is why I have rather grave doubts as to whether they could have sold the bonds when they got up to the point of raising capital, and moreover for retrospective valuation like that, it would have to be remembered that it was a construction project actually at the time, and the financing of a construction project in 1931 would probably have involved tremendous difficulties. It was probably a practical matter ~~not~~ to think of public financing at the time.

I have given some thought to the required yield on bonds of this company ~~today~~ if offered to the public. It would largely depend on how much capital the company would choose to raise that way, what coverage they would be able to provide. I considered the coverage that they would be able to provide and the amount they would normally offer if they tried to raise capital in that way. That is a device which one normally employs as a sort of an experimental check to see how the situation might stand. I do not think it would be practical to think of more than a 40 per cent debt ratio; and it seems to me that to offer almost the only kind of a bond which the present market receives very favorably, would probably require a 5 times interest requirements coverage, and therefore, including the cost of financing, that is, reflecting the cost to the company as well as the yield to the investor, that that probably would be 4¼ or 4½ per cent.

I have read the report of the recent Northern Natural Gas Company financing. I do not recall the ratio of the bonds to the total capitalization but I think the coverage was something over 6:9 times. I do not recall the ratio of the debt. I know that the income coverage was very high. The yield, I belive, was about 3.25. The issue was $16,000,000, sold in August, 1939, I think. I do not have in mind what the times earned coverage would be if bonds of Natural Gas Pipeline Company were issued to 40 per cent of the capitalization of the company at 3.25. I did not think it was necessary to make that calculation. I think it advisable to find out whether this company could finance today the issuance of 40 per cent first mortgage bonds and
the coupons that such bonds would have to bear, but
1334 I do not think it necessary to think in terms of the ab-
solute quantities of bonds. I was cognizant of the fact that the Northern Natural was financing today with bonds bearing 3¼ per cent coupon rate and of the coverage required for that coupon rate. I made no attempt to determine what the coverage of Natural Gas Pipeline Company would be if it were today to finance on a basis of 40 per cent of first mortgage bonds carrying that 3.25 coupon rate. I went through a calculation on a 5 times coverage basis. I do not think it pertinent whether we think in terms of $40,000,000 or $60,000,000 situation if we have our yield and our coverage relationships.

The coverage is the income available related to dollars of yield. The dollars yield depends upon the dollars amount of bonds outstanding. You can make that calculation per thousand dollar bond just as well as per hundred thousand or million dollars of bonds. The times earned coverage depends upon the income of the company and the debt that the company might have. They must not be taken alone. The first base is the income and the second base is the amount of debt, and the third base is the interest rate which that debt bears. With those three figures you can determine the times earned coverage, but you can take $100 as the base or $1,000 as the base, and set up 40 per cent from it as your debt. I am giving you an explanation of the principle as to how it could be done without reference to the particular volume of the debt. I did not calculate in my mind as to whether defendants could issue bonds at the rate of the Northern Natural Gas Company bonds. I did not calculate it back to a 3.25 basis. I assumed a 40 per cent debt as a 4¼ to 4½ per cent net cost to the company. On a 9 per cent rate of return, an indebtness of 40 per cent bearing 3¼ per cent interest would result in coverage of 4 to 4½.

On page 5577, I testified that "pure interest would more nearly approach the yield on as near to a riskless loan as one might be able to envision." I am not prepared to say that pure interest is synonomous with the interest on a riskless loan today. I think that is one of the ways for approximation, but as I pointed out in my testimony, you can have riskless loans or approximately riskless loans or what are considered prime loans yielding you less than 1 per cent, and also yielding you close to 3 per cent probably, and to impute to either of these rates pure interest puts you in the dilemma of explaining how you can have two different rates at the same time. While pure interest would more nearly approach the yield of as near to a riskless loan as we may be able to envision, if there are any other factors in it, then obviously the yield on that type of loan would not reflect pure interest.

At page 5579, I testified concerning enterprising capital and the necessary return to the entrepreneur in industry. In the particular instance it seems to me that all of the capital was entrepreneurial and is still so. It was not entrepreneurial capital that purchased the bonds of various natuarl gas companies this summer. I think most of them were placed with life insurance companies. To a limited extent such institutions place their funds in enterprises of that sort which are established and doing business. The entire bond issue of the Northern Natural was taken up by institutions. I do not belive that very generally the funds of savings banks or trust funds could be invested in bonds of natural gas pipelines. I do not know as a matter of fact, but it is my impression that they might have difficulty in qualifying in the leading states as legal investments even as a type.

I am familiar with law of the State of New York as to the type of bonds that are legal investments. I under-
1335 stand there is a department of the State government
that passes on a particular issue. Whether the type of investment is legal depends upon the interpretation of the law by that department. I informed myself as to the requirement of the law in New York because that is an important state. I have a statement I thought was pertinent. It is from McKinney's Consolidated Laws of New York, annotated 1939 cumulative annual pocket part, book 4 of the banking laws, section 235. I will read this paragraph. "Bonds of any corporation which at the time of such investment is incorporated under the laws of the United States or any state thereof, or the District of Columbia, and transacting the business of supplying electrical energy, or artificial gas or natural gas purchased from another corporation and supplied in substitution for, or in mixture with, artificial gas, for light, heat, power and other purposes, or transacting any or all of such business, provided, at least seventy-five per centum of the gross operating revenues of any such corporation are derived from such business, and not more than fifteen per centum of the gross operating revenues are derived from any one kind of business other than supplying electricity or gas or electricity and gas; and provided such corporation is subject to regulation by a public service commission or public utility commission, or other similar regulatory body duly established by the laws of the United States or the states in which such corporation operates, subject to the following conditions:".

I made an effort to come to a conclusion as to whether the bonds of defendants qualified as the tpye of investment under that section. The banking department of New York State will not answer a hypothetical application for qualification, but in the course of the effort to obtain such a predetermination, I did gather the opinion that a natural gas pipeline company as such could not qualify or probably would not qualify under the law. That is my opinion as to whether it would or not. I could not qualify probably as a type of investment which would qualify, because such a company, in my opinion, would not be a corporation supplying artificial or natuarl gas purchased from another corporation and supplied in substitution for or in mixture with artificial gas for light, heat, power and other purposes. Natural Gas Pipeline Company is a corporation organized under the laws of a state of the United States. It transacts the business of supplying natural gas at wholesale. I think I know what the term "the business" means in New York. I have an opinion on that. That company is obviously engaged in the natural gas business and purchases its natural gas from another corporation affiliated very closely as a wholly owned subsidiary, a corporate fiction which might be looked through. The natural gas it supplies is in substitution for or for mixture with artificial gas, and that gas is used for light, heat, power, or other purposes. I think 75 per cent of the gross operating revenues are derived from its business of supplying gas at wholesale and not more than 15 per cent of the gross operating revenue is derived from any one kind of business other than supplying natural gas.

It is presumed that this corporation is subject to regulation by a public regulatory body duly established by the laws of the United States. Still, my opinion is they are not available as a type for legal investment. I made direct inquiry to the Department of Banking of the State of New York on that point. I had my lawyers have conversations with them so that we could talk the lawyer's language
1336 over there. There are no formal opinions, because there are no natural gas pipeline bonds legal in New York State; but I went to great pains to get the opinions of people connected with the legislation which modified the law in New York State, the opinions of lawyers for savings banks who have a great deal to do with these questions, and conferred with two of the men on the staff of the Commission itself, and on the basis of their responses, I formed my opinion.

I testified at page 5583 "I was talking about the amount of care and attention which the owner of the securities had to give to certain types of securities as compared with other types about which he might feel very much freer and certain as to the future." I made no effort to find out how much care and attention the Standard Oil of New Jersey presently gives to its holdings in defendants. My testimony was with respect to the general principle of the ingredients of loan interest for attention and concern. I did not inquire as to what any particular investor had done.

My answer applies with respect to any one of the group of investors in this enterprise.

At page 5590 I testified: "What we have in mind is simply the time and attention, the energy, care and concern which the people who put up the money give to it over and above the attention which is given by hired managers, technicians, specialists, which the enterprise itself may hire." In this instance the people who put up the money would be the artificial persons, the corporations which made the investment. It is true they function through individuals, but those individuals were their own employees and not employees of defendants. That was the burden of my distinction here. I do not know whether the time and attention of any of the individuals given to this enterprise was charged to operating expenses of any public utility company. I made no effort to find that out. I know that none of these companies are public utilities and I let it go at that. Cities Service Company as such is not a public utility. I do not know where the people who worked on this enterprise and who were a part of the Cities Service system were employed at the time they were working on this enterprise. I don't know where their wages were charged, but if they were employees of the Cities Service Company they should have been on that company's payroll. If they were not employees of the Cities Service Company but of some company in the Cities Service system, then they presumably would be employees of the company in the system and would be paid by it unless they went to to the refinement, which perhaps they should have, of dividing the time and making appropriate allocations. I do not know ~~the~~ facts as to those charges. I made no effort to determine the accounting procedure with respect to the salaries of those individuals. I believe the Chicago utilities who were interested in this company had people devoting time to the investment at its inception. I made no effort to determine whether their salaries were charged to operating expenses of operating utilities.

At line 14 of page 5590 I stated in substance that I thought it entirely contrary to the fact to assume that these enterprising capitalists can and do sublet all these functions of giving care and concern to the investment. By "they" I meant the people who directly or indirectly or ultimately had their funds at stake. I had reference not to the corporate intermediary necessarily, but to those people who ultimately had a substantial investment at stake.

I don't know who they were. There is Henry L. Doherty, for example, who is undoubtedly such a final person.

1337 The question asked me by Mr. Morgan at page 5588 I took to be a hypothetical question based on the record in the case. I was applyling the principle that I had been discussing to the record in this case. When I stated that "as a practical matter, if they have confidence in their own opinion and are of that class, they probably cannot find the people in whose decisions they have equal confidence," and so on, I had in mind there as a general group those ultimate investors. I did not feel called upon to specify them by name. I don't know their names. I think I had in mind the people who had a substantial financial interest —an enterpriser's interest—in the companies which either directly or indirectly made the investments in this undertaking. I did not include all of the common stockholders of the Cities Service Company, obviously. I had in mind those who had a substantial interest. By "substantial interest" I mean something in contrast to 10 or 20 shares of the small investors. I don't think I had a definite number of shares in mind. I definitely had more than 20 or 100 in mind; undoubtedly more than 200, or a 1,000; probably more than 5,000, 10,000 or 20,000. I had in mind a substantial amount. I don't recall even about what the number of shares Cities Service was at that time. A change in the number of shares makes it impossible to say 10,000 or 100,000. I had in mind the kind of an interest that Mr. Doherty might have in Cities Service. I don't think I had any individuals specifically in mind outside of Mr. Doherty whose interest in this thing from the beginning evidenced that sort of concern. I don't know that he was putting up somebody else's money. He was putting up money of a corporation in which he had a substantial interest, I belive. I don't know what that interest was. I had the impression that it was substantial in 1929 and 1930. I know it was substantial. I happened to have been involved in undertakings where it was disclosed what his interests were. I don't remember the figures. I'm sorry; that was a number of years ago. I think Henry L. Doherty typifies what I had in mind there. I did not have anyone specifically in mind. I don't know the investment distribution of the large interests in the Standard Oil Company of New Jersey. I had no one particularly in mind with respect to the Texas Company, or the Columbian Carbon Company, or the Southwestern Development Company. In the Natural Gas Investment

Company representing the Illinois utilities, there was Mr. Insull as typifying the enterpriser. I do not know what Mr. Insull's interests were in the Chicago utilities in 1929 and 1930. They were still quite substantial as I remember. I would say very substantial. Those are the only two means that come to my mind. My answer would have been the same if I had known the names of the others and it would not have been different if I had not known those two names.

When I testified at page 5591 that the performance of the function of capital management does not take the form of a transaction, and so on, I was not thinking in terms of particular individuals in your answer to that question. The question was, as you will note at lines 4 and 5, "What is the difference between cost as you have used that term and expense?" I do not believe I had anyone particularly in mind when I made that answer. I do not think the answer implies that. I had no "the individual" in mind. I might have said "an individual" and it would have been just as appropriate. I have no particular individual in mind today. I think the statement applies to most individuals who have an investment, but I did not mean it as to no individual in general.

1338 At page 5592, I testified: "The performance of the functions of capital management to a considerable extent precede the actual commitment of capital, in fact much of the work is done normally prior to an actual commitment." The people I had in mind there were the individuals who were not paid or hired employees of this concern or of the syndicates or groups who preceded it. I don't know the names of any such people. I'm quite confident there were such people. I would very much doubt whether the committees that met and undoubtedly discussed this project accounted for their time against the undertaking. Mr. Gallagher was being paid a salary some place when he was on those committees; his salary affected the net income of the companies in which there were investments by others who were the ultimate common stock entrepreneurs. I don't know whether that salary is or was at that time being charged to operating expenses of a public utility. Mr. Gallagher has been identified as having had something to do with an oil company here. The presumption is that his salary and that ultimately means his time and energy affected the flow of income of the corporate enterprise which was paying him. Directly or indirectly

Standard Oil Company is interested in some natural gas companies. The Hope Natural Gas System is a Standard Oil subsidiary. I would be very much surprised if, as a Standard Oil employee, his salary was charged down to some utility company. As to the Cities Service Company, holding companies in a managerial relationship are a different matter. I did not know that Mr. Gallagher was an executive of a public utility company as stated here by Mr. Booth. My surprise was directed at any circumstance under which an employee of the Standard Oil Company would find his salary charged to a public utility company in which they had an interest. But an employee of a public utility company in which the Standard Oil Company had an interest might well have served as Standard's representative in this early syndicate in the arrangements which preceded this company. Mr. Gallagher might have been an executive of several companies and his salary might have been divided in the light of that and his time appropriately divided. I do not know the facts.

Any given industrial unit in the electric industry, within the range of operations now envisioned, would experience decreasing costs and increasing returns. It was characterized by the possibility of lower costs to the consumers. That observation is not so true of the manufactured gas industry. I could not say how much less true it is. As to the natural gas industry, insofar as there is an element of exhaustible natural resource in it, the principle is not true, and we have more commonly to recognize that as an industry of increasing costs. When you suggest that the natural gas industry was characterized by decreasing costs and increasing returns, you are confusing two types of cost behavior. I don't know what you mean; I don't know what phenomena you refer to. I can explain the two of them to you and then you can see. Externally the natural gas industry is not so characterized. As for the gas industry as a whole, it is not so characterized in any marked degree.

I said four or five years ago that the gas industry was characterized by decreasing costs and increasing returns, and thus the possibility of lower prices to the consumer at a time when I was speaking of internal cost behavior and not external cost. I don't know whether I made that statement flatly and categorically five years ago. You will have to refresh my memory, but I am taking your word for granted. I submitted a statement to the Senate Commit-

tee on Interstate Commerce during the hearings on the Holding Company bill. The document submitted was the reduction of a speech which I allowed them to present. I don't think it is an accurate statement to say that this document was presented through the medium of the Associated Gas & Electric system. I believe Mr. Burroughs, the vice president of the Associated Gas & Electric Company or someone else, submitted my statement in a letter which was sent to the members of the Committee on Interstate Commerce of the United States Senate. I don't know that he did. I think I could have said in that document that "the gas and electric industries are characterized by decreasing costs, increasing returns, and thus the possibility of lower prices to the consumers." I cannot
1339 remember a document of that sort for that length of time.

You have handed me the document and I find that you have accurately stated what I said there. I think I received a fee for preparing that document for publication; I don't remember the amount. It was a paper that I had presented in substance before the Economic Research Round Table that meets at the Bankers Club, and I think some representative of the company was there and heard it. The fee to which I referred was paid by the company. It was a paper which required considerable polishing and fixing up before it was presented as a public document which it was apparently going to be. I think that statement appeared in the original presentation before the Economic Research Round Table. The statement I made was a perfectly valid principle, and I would not dispute that I said it before and would say it again. I am not disputing that principle today. It has to be understood in its context, however. You have to understand the kind of increasing cost you are talking about before it means anything. I think the members of the Senate Committee probably would construe the terms in the sense in which I used them and not in the sense in which the phenomena develops with respect to a natural resource. I don't think I made the distinction in that paper.

At page 5594, I testified that it was my opinion that the wages of capital management did not take the form which would be readily reflected as an expense; that the appropriate way to recognize its compensation is in the return. If, as you suggest, it did take the form which would be reflected as an expense, that would not change my answer. It might be reflected as the expense of one of the corporate enterprises in the case of an employee of such an enterprising corporation, and thus cause a reduction of the net income which that company would otherwise have. If it is reflected as an expense and changed as an expense of this enterprise, it should not be included in the return. I tried to be very careful about that. It is entirely inappropriate to charge it twice. Applying the principle to this company, the analogous period after making the mortage loan in the case used as the illustration, would be the period after the enterprise began. I had no intention of implying that any of the expenses which are normally experienced by a form of enterprise such as the Natural Gas Pipeline Company of America are appropriately to be considered in this other factor,—the added cost of giving continuing concern to the management of the investment. The expenses which would be charged are not involved in the return; it is quite inappropriate to do so, as I say.

At page 5596, I testified that I thought just as soon as the investor had a reasonably substantial interest in considering the possibilities of a given line of employment of his capital, that he would then be conscious of the amount of extra attention, concern and effort that this particular line would impose on him in the light of the return which is probably available, and he would make a comparison between that and the alternatives that would be available to him. That answer was made in reply to a question with respect to the general principle. I do not gather that it has any relationship to this particular enterprise from the part of the record I have been able to look at. I think that was a general observation with respect to a type of return which is applicable here and any other
1340 enterprise.

You ask me as to the identity of "he", referred to in my answer. I think the term "he" is properly interpreted to refer to the corporate or individual enterprisers who were investing in that undertaking. There were no individual enterprisers investing directly in defendants. I mean the corporate enterprisers who invested directly, and the individual enterprisers who invested indirectly. The corporate enterprisers were the six corporate entities who participated in this company. The only individual enterprisers whose names I recall just now are Henry L. Doherty and Sanuel Insull. I do not agree that the two individual indirect investors are all of the individual enterprisers. I can only think of those two individuals.

There must have been others. I do not recall that I thought of others during the preparation of my testimony in this case. If I had not thought of any individuals, my testimony would have been the same.

I believe I testified at page 5605 that: "The first statement I would like to make is that it depends upon whether the enterprising capitalist envisioned the probable gains from taking these pioneering risks, whether they were entirely fortuitous or whether they were part of his inducement as a first and most fundamental consideration," and so forth. In that statement, I was referring to the six enterprising corporations and any individuals secondarily involved irrespective of my memory as to their names. The names of the individuals were not essential to the answer.

I cannot tell you today in relating that generalization to this specific enterprise anyone besides the two individuals in the six corporations who had that position of enterprising capitalist that I spoke of in my general answers. I don't know today what any of these enterprising capitalists in this particular investment or enterprise envisioned with respect to return or additional increment of return that may have been under discussion in my general answer. In the earlier part of the same answer, I stated that the answer to the question that had been asked me could not be given absolutely and categorically; that it involved an amount of economic analysis which is probably to a degree unknown except to those who engage in that sort of refined thinking.

By "those who engage in that sort of refined thinking," I was referring to economists or others who are sufficiently acquainted with it, to use a marginal approach to the analysis. Certainly, I assumed that the Federal Power Commission was capable of the necessary economic analysis or the necessary refined thinking to cope with that problem. They must have specialists capable of dealing in those terms. In fact, I know they have.

At page 5607 I stated: "Of course, assuming that there is no monopoly of the opportunity, that there is an opportunity for this competition of the people who are willing to assume these functions at differeent prices, and that there is every opportunity for free bargaining in every sense to achieve or get hold of this opportunity, the fellow who is willing to work for society at the lowest price in general and on the average gets the opportunity." I believe in general those assumptions apply here, as I understood the circumstances to prevail in 1929.

1341 Yes, the Chicago utility interests became participants in this venture. Their becoming participants in the venture introduced an element of restraint which might be termed a practical monopoly. I merely wanted to note that I was not certain that a pipeline could not have been built to the industrial areas around Chicago without the necessary cooperation of the Insull utilities. As to whether a pipeline could be built into the industrial areas to carry only an industrial load to distribute direct to industries and be profitable and earn a 9 per cent return is a big question I don't know. I merely wanted to protect the previous answer by calling attention to that possibility. I don't think what I said is metaphysical speculation by any means. We are not engaged nor are we trying to be engaged in any kind of a speculation, but we are trying to relate ourselves to reasonable probalities or reasonable possibilities. I think there is a reasonable possibility that someone else would build a pipeline into Chicago notwithstanding those who controlled the retail market were participants in this venture.

My recollection of these proposals at that time was that there were different people considering this kind of an undertaking. I don't know about the dates as to whether they were considering it after the Chicago utility interests became participants; but it is also to be recalled in that connection that this project was undertaken and projected before the Insull interests made themselves a part of it. I think it is reasonable to say that when the Chicago utility interests joined up with this enterprise that the opportunity for someone else to participate with the Insull interests there was probably foreclosed. There could have been competition for the Insull participation. I don't know whether the freedom or the lack of freedom of opportunity was dependent also upon the control of reserves in the Texas Panhandle.

I do not feel that I am competent to judge as to whether or not it could have been done from the Hugoton field in Kansas. I do not know whether the Hugoton field had been proved in at that time.

Assuming that the enterprise was to bring natural gas from the Texas Panhandle field to Chicago, the opportunity depended to a large extent upon control of reserves in the Panhandle field. My understanding is that this particular company controls only about 10 percent of the acreage down there. Certainly, they should have attempted to obtain an adequate amount of reserves to provide adequate reserves for the city of Chicago.

As to whether there was every opportunity for free bargaining in every sense to achieve or get hold of this opportunity in this case, I think it is difficult to state as a fact. I don't know that there was every opportunity. The question there was one dealing with principle. I thought I had given a complete and elaborate answer there so that there would not be any misunderstanding as to what was involved. I purposely put in this observation to make it perfectly clear that this principle would operate under such conditions. To the extent that those conditions may be absent, the principle would not operate as perfectly. The principle could be carried to an extreme so that, in the absence of some of the conditions, it would not apply at all.

I cannot testify to everything that is in the record. I have not read it all. (Objection by Company Counsel overruled). If it could be assumed that there was a monopoly, then the principle of competitive determination of marginal returns would not operate. Of course, if the assumption that I made did not in fact exist, then the compensation for the performance of the function might
be considerably greater than that marginal necessary
1342 compensation, and I believe it is a fact that it might
be more than the socially lowest cost.

In my answer at page 5608, beginning at line 9, and my answer at page 5611, line 15, I was assuming what we might term the free play of competitive forces. So then if there was not that free play of competitive forces present, then, as a pure theoretical concept, you would be doing the entrepreneur no injustice and society no harm by depriving the entrepreneur of that excess above the marginally necessary increment.

I would want to add for a degree of realism that we realize that practically nowhere in economic society does such a perfect state exist; and all practical circumstances are to an extent not representative of this pure conception. I was attempting to state the principle in as simple as possible terms in my direct testimony.

At page 5614 I testified in substance that "if it becomes the understanding of people potentially disposed to be enterprisers that there is to be no allowance of any compensation for the exercise of these functions, they naturally will not be disposed to assume them," and so on. No, I was not discussing that as just a theory or academic concept. I think that is quite related to the practical realities. Continuing, I said that "as a result of that, the progress of our industrinal system would be hampered, the disposition to go into these things would be discouraged, and society would lose the benefit of the improvements; and more than that, I think it would lose the benefits of the efforts to do the things more economically which is another result of the operation of this kind of system."

I feel the railroad industry as a striking illustration of that in the United States. To an extent, I think the electric light and power industry is becoming an illustration; and to a very considerable extent, the enterprise of real estate developers and operators is being influenced in large cities. I was discussing the general principle. In addition to those I named, the urban transportation industry is an example. I think the manufactured gas industry might be included. I was speaking generally in response to a general question of the general principle of inducement. It is all pervasive. It operates in every aspect of economic behavior. The question was one of which I believe one thinks rarely in terms of an abstract principle but relates it to instances.

You are trying to get me to place my mind back at the time I was thinking those things out, which is very difficult. You appreciate it is casting back to the time when I was thinking these things out. I don't remember everything that went through my mind at the time. I did not say that the railroad industry has not attempted to apply new things or new techniques to the industry. From time to time they make a bit of an effort here and there, such as buying a few streamlined passenger trains. As to what I think of the electrification of railroads, I don't think much of it. There is considerable doubt as to whether that is an advance in technique in my judgment. It is my opinion that the railroad industry status today is to a considerable extent the result of discouragement in that industry. It has attempted to apply new things and new technique to the development of new products or new markets.

1343 The electric light and power industry had had a period of very rapid growth and splendid accomplishment. It is continually applying new things and new techniques to the development of new products and new markets; but I believe at a clearly slower rate. To some extent it is still going forward and attempting to apply new things and new techniques to the development of new products and new markets.

I believe that socity has lost the benefit of improvements that might otherwise have been made in the electric light and power industry. In other words, I believe that the development rate has been slowed up through the discouragement of enterprise. I think undoubtedly that in the electric light and power industry there is a disposition not to go as far in capital investment assumed.

At page 5618 I testified: "There are the chances of loss over and above the calculable or approximately calcuable risks which have to be recognized, and those we choose to distinguish as uncertainties," and so on. Of course, there is a chance of the experience basis reflecting either above or below the indicated or calculable, but the probabilities are always pretty much on the above side. I understand that the actuarial calculations with respect to insurance companies are not necessarily based on their own experience, and a good many of them are using primary actuarial calculations which more recent experience has probably disclosed as obsolete. The chance of loss to the specific company might be either greater or less than indicated by the actuarial experience of the others. I just wanted to point out that many companies report a better experience than the actuarial experience, and the reason for that is that a true actuarial basis was probably not initially employed.

At page 5622 I testified: "Despite the imposition of regulation as a legal fact, entrepreneural investors still persisted in the belief that there was a chance for an enterpriser's return in those industries; and as a matter of fact the regulatory process was not imposed with the rigidity which the regulatory formula would imply in all of the States of the United States," and so forth. You ask as to whether the regulatory formula was applied in different states with varying degrees of severity. I do not like the use of the word "severity". I would answer it and say yes, that it was applied in different states at different times and the scope of that regulation was different, and the commissions probably differed in the assiduousness with which they went after the application of the legislation.

I have pointed out that regulation of the electric industry started earlier in some states than in others, and was enforced more vigorously in some states than in others. The statutory provisions in some states were different from the others and bore differently upon the industry in different states. I think I meant to imply that to an extent entrepreneurs gave some consideration to these differences, but it must be recognized that there are many other factors involved as well as this one, which is only one of many considerations which probably operated to determine the comparative development in different states.

1344 There has been a public service commission in New York since 1908. In Kentucky there was no public service commission until 1934. I think that the electric entrepreneur was influenced in evaluating an investment in New York as against one in Kentucky by the fact that New York had state regulation and Kentucky did not. I think the effect of regulation in New York was to discourage investment in New York electric utilities. I do not think it had a determining influence, however. I believe it did have an effect in discouraging investment in electric utilities in New York as against similar investments in Kentucky. I don't believe it was determinative because the states are so noncomparable otherwise. That factor had some insubstantial effect in discouraging investment in electric utilities in New York state as against investment in similar utilities in Kentucky. I think, therefore, the effect was not substantial as between those particular states. I cannot say that I know of any investor who preferred to invest money in Kentucky rather than New York. That circumstance is due to the other factors involved.

I don't know the percentage of the total investment in the electric utility industry throughout the country, which is represented by New York investments in that field. It is a very substantial percentage. It might be 10 per cent or more. Consolidated Edison has big figures of plant of something like seven or eight hundred million dollars.

The observations I have made with reference to the electric industry do not apply significantly to the telephone industry. I do not think the telephone industry has been discouraged or hampered as much as the electric industry by the application of the regulatory process. I am not prepared to say how much it has been hampered. I can not give quantitative expression to a judgment of that sort. The Bell System represents 80 or 90 per cent of the total capital invested in the telephone industry. I think it is a fact that the greatest growth of the Bell System has occurred under regulation. I do not have in mind exactly the number of states that did anything significant about telephone regulation.

Cross-Examination Interposed by Mr. Booth.

It is true that between 1920 and 1930 there was considerable litigation over the rates of telephone companies in this country. There were a great many orders entered by public service commissions and utility commissions in various states in the United States, cutting the rates of telephone companies. I have the impression that it was in a relatively few states in which the activities took place.

I have read the opinion in Lindheimer *vs.* Illinois Bell Telephone Company. I do not remember when the order in that case was entered. It took a long number of years to bring it to a conclusion. I can not say that during the pendency of that proceeding there was any retarding of the growth of the Illinois Bell Telephone Company in the State of Illinois: I have not examined it. I think there was a rather substantial growth of that company during that period. Growth and prosperity of that company was mentioned by the Supreme Court in its final decision in 1934. I am in no position to tell the Federal Power Commission that there was any retarding of the growth of the telephone industry as the result of the rate orders entered by the Illinois and the other commissions during the period 1920 to 1930. I do not know.

1345 *Cross-Examination by Mr. Slaff Resumed.*

I do not know the figure as to the number of stations in the Bell System in 1920, nor do I know the exact figures as of the present time. I have not the figures showing the investment in telephone plants in the year 1920. The figures you have stated here do not indicate any discouragement in entrepreneurial enterprise in the telephone industry. The first indication of discouragement of entrepreneurial enterprise in the telephone industry would come in the attitude of the executives and professional employees in the industry towards the future; their spirit and attitude with respect to their jobs. I think their general spirit is the first reflection.

I think the finest sort of a test as to how an industry is going is the test of the emotional attitude of the people in it that are close enough to these large problems to be responsive to them and not whether the stockholders or security holders are putting up the money in the future. In this test you can not put your finger on it but you can put your ear to it. There is no difference as to the fact in either instance. I tried to make it perfectly clear in my first answer on the telephone business, that I did not consider that as one of the industries where this movement had come to any high point as yet, compared particularly to the electric industry. I think it has come to the point where the managerial factor is feeling a bit discouraged about the future. I think that will be reflected in a gradual departure from the employment of these companies to the more enterprising opportunities.

As to whether Mr. Gifford will leave his job, I think he has reached the age where he probably will not consider a transfer. I do not think they are going to leave the telephone system and get into something like the natural gas system. Those who are disposed to respond and leave in search of the stimuli that come from enterprise and opportunity will, if they are young enough, tend to leave those industries in which that spirit develops; and, on the other hand, those industries cease recruiting the younger people who have that type of disposition. I think the conditions as they have developed in more recent years have started a movement of that sort in the telephone industry.

As to what I think of the prospect of the telephone company for the future, I think there is a disposition on the part of the more enterprising people to leave it if they have alternative opportunities and if they are not too old. The type of individual who is responsive to the circumstances we have been discussing would lay himself open to alternative opportunities. These alternative opportunities would be in some unregulated industry. There is going to be an exodus of young enterprising spirits from the telephone industry to unregulated industry, under the conditions of my previous answers. That is what happened to the railroad industry. In my judgment there will be some exodus of young enterprising spirits from the telephone industry into unregulated industry in the future, but I have not decided how much. I think the impact has already taken place today. It is a factor that is already beginning to operate. I have talked to a great many telephone people and I have gotten the reflections of their feelings. I think the Bell System is being pretty well operated today.

1346 At page 5623 I testified: "It is only in relatively recent times that in still relatively restricted quarters there is the increased warning to the entrepreneurs and investors that this regulatory formula is going to be imposed with increasing rigidity and precision and exactness, and it is that, in my opinion, which is primarily making the investor feel that there is not going to be any chance for an adequately compensatory return." When I made that statement I had in mind the fact that the refinement of the regulatory technique was beginning in certain states, among which I could mention Wisconsin, New York and California. They were imposing regulation at an early date, and are not a good illustration of a recent trend. I think Illinois could also be mentioned. I used that expression merely to refer to it as beginning at certain places. Some people say it began in New York and some say in Wisconsin. I would not argue about that. That is spreading now to other states under the guidance of the Committees of the National Association of Railway and Utility Commissioners; and new legislation is spreading to other states. A large number of them, for example, have adopted the Committees' recommendations with respect to original cost accounting. There are implications which very much concern the informed investors and discourage them. I do not know whether I read the statements about these regulated institutions or businesses withholding their money and not expanding their businesses in the newspapers, financial journals or where, but it is my impression that they were becoming discouraged.

Such public observations as statements at national conventions of the utilities, and so on, whether they are optimistic, sales promotion speeches or other things, I do not place an awful lot of confidence in. I merely called attention to the fact that in a few places it was starting; and it was now under the guidance of the National Association, and to some extent as the result of the introduction of Federal regulation these newer approaches were spreading rather rapidly.

As to what Federal regulation I referred to, the Federal Power Commission is an example. I was thinking specifically of the Federal Power Commission, in relation to the electric industry. The promulgation of a classification of accounts by the Federal Power Commission put commissions in many states in an awkward position unless there was a disposition to make their requirements conform or be identical with the Federal Power Commission's requirements. I have not said that the adoption of a uniform system of accounts is discouraging to the investor. I said that the introduction of Federal regulation and the use of such a device tended to speed up the adoption of similar or identical principles in a great many of the states. It is as discouraging as the principles according to which they are proceeding. The point was merely that that was hastening the process. I think regulation under the Federal Power Commission is one of the things that has implications which are discouraging to investors. As to such regulations as the Securities and Exchange Commission makes, I think some of these regulations operate probably in one direction and some in another.

I think the requirements under the Holding Company Act are probably interfering to a considerable extent with what might otherwise be done. I think there would be considerable willingness to speculate on integrating and organizing the industry if it did not have to go through the process which it appears to have to go through. The regulation of security issues is one of the things I had in mind that probably, on net balance, was contributing something in the way of an advantage to the investor. I am very much in sympathy with the information requirements of the Securities Act. I think that when an investor in-
1347 vests in a utility security which is subject to the
jurisdiction of the S. E. C., he appreciates the circumstances that the security has undergone careful scrutiny by the Commission to see whether it meets the standards prescribed in the statute. Very definite standards are prescribed in the Holding Company Act of 1935 for the protection of investors.

Going back to the problem of state regulation, I spoke of the tendency through the committees of the National

Association to adopt original cost principles, as one of the specific things I had in mind. In addition, I might add the identification of property under the acquisition adjustment accounts. The investor is frightened by that regulation because he does not know what it means. He is worried about it. The imposition or attempted imposition or attempted imposition of straight line depreciation, for instance.

The application of straight line depreciation for the telephone industry has not discouraged investors because they started early and accumulated very substantial reserves. I do not know that you can just relate the fact that that has encouraged the growth of the industry. It has been a practice which has resulted in the collection, from the customers, of substantial reserves which were available for investment in property. If that capital is more readily available than outside capital, that would be true to that extent. It would naturally contribute to the growth of the industry and as far as these funds have been available for that purpose they have contributed to or resulted in growth.

Another factor of discouragement is the more frequent rate revisions, the frequency of rate attention. Yes, I know of the Potomac Electric Company. I am familiar with the plan under which that company operates, known as the Washington plan. That requires regular annual year-by-year rate revision and it is also, allegedly, a profit sharing plan. I have a recollection in general that there have been reductions in rates from time to time since 1924 or 1925, practically every year. I do not know that the top residential rates in Washington have been reduced 30-odd percent since this so-called Washington plan of regulation was put into operation. There have been substantial reductions, both in top rates and average rates. The average rate of course goes down with the volume of consumption at the lower points in the rate schedule. The company has shared some increases in profits. I do not know that it is a fact that year by year there have been increases in profits by Potomac Electric Company, but I believe that is true. The Potomac Electric Company is an entirely different circumstance, a very different situation. I do not know that there has been no discouragement to the investor, but I know the Washington plan has operated reasonably well.

Whether the holding company gets a larger percent of dividends on its stock in the Potomac Electric Company than it gets on any other of its subsidiaries, if true is not conclusive. I do not know whether it is a fact, but the utility is doing very well. It does not necessarily mean anything that the Potomac Electric Power Company paid something like 65% on its common stock last year with relation to dividends. I do not know it is a fact, Mr. Slaff. If you state it is, then I am willing to accept it for the purpose of discussion. I know the percentage has been high. I do not believe in this particular instance that frequent rate revisions and frequent rate reductions have discouraged investment in that utility.

I have testified that approximately one-half of various utility enterprises, including transportation and other public utilities, were not recorded as having any taxable income for the year 1930. I think it was 1930. Yes, there
1348 is a difference between the question as put and the
answer as given, that is to say, between earning enough to pay an income tax and having a taxable income. I had not thought of it and did not, therefore, respond accurately to the question. I recognize that distinction. They might have an income reported or available and still have enough deductions or losses that the Internal Revenue Department would recognize that in that year they would not have to pay anything. An investigation of the Senate Banking Committee disclosed that in 1930 and 1931 various people took such large losses that they did not have to pay any taxes. They had been earning enough to pay income taxes but they had no taxable income because of deductions they could take.

I remember my testimony at page 6550, in which I said in substance that prior to regulation, defendants were industries subject to both large losses and possibly large gains, and that the history of this industry is strewn with cases of loss which make it clearly classifiable as an industry in which many lose and apparently from the records, some can make substantial gains. I was speaking from memory at the time I testified. There were companies that was doing quite well. I do not know that I have any particular company in mind. I have examined the earnings of a great many companies. I would not say that this is just a general observation with no specific application. I took the time and trouble to study the businesses in the industry. I gave particular attention to the failures and cases of receivership. That addition "apparently from the records, some can make substantial gains" was possibly gratuitous, merely to recognize that there were those who were making money, that the other thing was not wholly representative of the industry. I put it in there just for that purpose. I did not want it understood that the whole industry was bankrupt. I merely reflected my opinion that there were instances in the industry of companies that were doing fairly well in contrast to the others. I had no particular companies or systems specifically in mind. Some were obviously doing well compared to the average run of the mill.

I appreciate the fact that you are having some difficulty in trying to understand my general observations. No, I had no specific figure or amount in mind, percentagewise or otherwise, when I used the terms "large gains" and "substantial gains." I had in mind clearly to contrast it with what I found in the portion of the industry which had not done well. I had not come to any conclusion about this particular company. This is so special that it was outside of the range of the industry as a whole.

As to whether or not those companies in the past which have sustained losses did so because they were not provided with adequate reserves, I may say that in the early history I was impressed with the instances of that. In later years, there have been probably other causes. I was not in position to identify the causes. I took the facts of failures into consideration. I made no general classification of causes with respect to my statistical studies. I could not help but think about the possible causes, but I did not have the occasion to investigate. I made no statistical studies on that point. I have enumerated insufficient reserves as one of the causes. There were undoubtedly financial causes; bad capitalization, possibly; probably there were managerial problems in some of them; franchise and market problems; competitive situations. I did not give any
1349 formal attention to these matters. My interest was the extent of the investor's actual experience, and I have more or less realized that the investor does not go too far back. I do not think this exhausts the list of causes. It probably reflects as many as I think of now, not having given any special attention to it.

(November 1, 1939.)

At page 5771 I testified: "On the basis of past behavior and present outlook, as an economist I would be very skeptical of estimates which assumed that taxes are going to remain at the present level;" and at page 5781 I stated: "It seems to me it sums up to the reasonable economic expectation that higher unit costs of production would result in the future." I think those predictions are better than my prediction in June, 1937, as to the future course of the price level. I don't remember exactly what that prediction was. I think it was a very carefully stated analysis of what the factors and influence might be.

I don't remember whether I testified before Master Swisler on June 9, 1937, that in my opinion we were facing a distinctly rising price level in commodity prices in this country. I recall a rather extended discussion of the difficulties of forecasting and the considerations involved, and I do remember stating that I believed that the opinion of those technically trained to do that should be given more weight than the opinion of those who were not so trained. I do recall that statement. (Objection by Company Counsel overruled.)

You have shown me a document which you described as an abstract of the testimony in that case. I cannot say for certain that that is an accurate summarization; but I think if it is taken in connection with the rest of the statement, that it probably can be fairly interpreted so. I have some doubts as to how totally accurate that summary is. I recall that Mr. Booth was present during that discussion and I recall a good deal of the discussion. I have little doubt but that I probably said what is indicated in the record, but I am distinctly not satisfied at taking that one sentence out of all that was said. I have not said that I am not satisfied with my prediction in 1937. I believe it was a reasonable prediction. I am satisfied with a good deal of it. I have no doubt but what I said that among other things in response to those questions then asked me. I am satisfied that it was a reasonable estimate to make at the time. I am not satisfied with the results, no. They are two different things. I do not recall specifically the questions in that connection. I have not read the testimony.

If I read the summary correctly, I was in part skipping over the two years from June, 1937, to the summer of 1939. I made reference to the possibility of a war breaking out in 1939 in that statement. That would be one of the things which turned out to be right. I think that when I testified in June, 1937, I was intending to skip the period 1937 to 1939. If I remember the total of that discussion, I did project my estimates to a period such as 1939 and 1940.

If I recall correctly my expectation was that a price level rise would get under way in substantial proportions within the two or three-year period envisioned there. I would have to check up on my price index chart before I would agree with you that there has been a steady decline since June 1937, the date I testified, down to the summer of 1939. I do not have that chart. I am looking
1350 at a price trend chart for construction costs of items of property that go into public utility and other industrial properties. I do not think a wholesale commodity price index is as pertinent as an index of ingredients of industrial construction. If I speak of commodity prices as an economist and a rise in the level of commodity prices, it might be presumed that I mean the general level; but, if I remember correctly, in that testimony I qualified it. I thought I saw when I quickly examined that summary a reference to construction costs. On examining the abstract, I find right here where I said "I think this applies most distinctly to durable goods". I did not say that it did not apply to goods generally. I said "most distinctly".

The Labor Bureau Index of wholesale commodity prices is generally accepted as a cost of living index. The Supreme Court of the United States, if I remember correctly, has thrown it out as an index of public utility values. I am not qualifying as a legal expert. I have an opinion as to what the legal characteristics of a public utility are. I think I made reference in my direct testimony as to what I thought they were.

I am a professor of economics in the field of public utili~~ties and devote my time to the study of~~ public utilities and what they are and what they do. I have devoted a very small part of my time in testifying on behalf of utilities, except in the last few weeks. A part of my time has been devoted to the preparation of that testimony. My preparation represents a very substantial amount of time in recent months, but over a year it does not represent very much time. I know more about that than I do about West *vs.* Chesapeake and Potomac Telephone Company, decided by the Supreme Court in June, 1939.

I think it is a fact that the Labor Bureau Index of wholesale commodity prices is generally accepted as a general index but it is not accepted as an index of the price levels for construction capital goods. I would have to refresh my memory as to the figures from the time I testified down to September, 1939, shown by the United States Labor Bureau Index of wholesale commodity prices to determine whether there has been a steady decline of wholesale commodity prices during that period. I have no papers with me from which to refresh my memory. I keep up with so many things, I do not memorize them all specifically. I look at that index when I have occasion to. It is not one of the things that comes across my desk regularly. I am an economist; but economics is a big subject, and I cannot keep up with all of the things, and they do not all come across my desk. This specific thing is not regularly routed across my desk. I do not follow the Labor Bureau Index of wholesale commodity prices unless I have occasion to. I think I see it frequently enough to keep up with it. I also keep myself advised generally about where it stands in relation to other periods and other times. I am under the impression that there was a decline in the wholesale commodity price index from June, 1937 down to September, 1939. I do not remember how much. I would not want to estimate it. I can not say whether it was 1 percent, 2 percent or 5 percent.

You have handed me a paper which appears to be the wholesale price level based on 1926 as 100. It stood as an average for the year 1937 at 86.3, and the average for 1938 was 78.6. When I testified in June, 1937, it was 87.2. It went up a fraction of a point in July. Afterwards I think the decline is sufficiently regular to be denominated a steady decline to the last date shown on the index, which
is January, 1939, when it stood at 76.9. This was
1351 lower than the average for the year 1938. (Objection by company Counsel overruled.)

To the best of my recollection, at the conclusion of my testimony yesterday, I set out several possible causes for losses suffered in the past by companies in the industry, among them, insufficient reserves, bad capitalization, managerial problems, franchises and marketing problems and competitive situations. With respect to the possibilities of the factors I was discussing at the conclusion of my testimony yesterday as those causing losses to companies in the industry in the past, operating on any new enterprise in this field today, I agree that there has been some improvement so far as those factors are concerned due to the presence in the regulatory field of the Securities and Exchange Commission and the statutes under which it works, the Federal Power Commission, and the Natural Gas Act under which it works, insofar as bad financial capitalization, for example, was a cause with respect to a company that was publicly financed. I would expect that the present regulations would operate to prevent some of that, insofar as it can be foreseen by the Securities and Exchange Commission. It is necessary to recognize that the capital arrangement would not necessarily be under very much control of the S. E. C. if it were a private venture. If the financing is public in any direct way, I think they would be hampered or curbed as to what they might do. Under the limitations I have mentioned, I think the effect of the factors which we mentioned yesterday and which you have detailed to me today, has been diminished in the last several years through the agency of the S. E. C. and the Federal Power Commission and the statutes under which they work. I am rather dubious about your suggestion that this is true with reference to competitive situations, if my interpretation of the Natural Gas Act is correct. You are right that prior to the enactment of the Natural Gas Act any competing line could come in and compete without the requirement of any Federal certificate of convenience and necessity. If I understand the Act correctly, the Federal Power Commission is under obligation to consider favorably an application for such a certificate if it can be shown that service by a competitive line can be rendered at a lower price. That is my over-all impression of that part of the statute dealing with that subject. It was on the basis of that impression or understanding, plus the opinion of the Commission in the case whose name I have forgotten for the moment, in which Commissioner Manly dissented, that I predicated such testimony as I gave on that subject. It was enlightening to have had that opinion on the point and it could hardly help but influence me in some part.

So far as the Federal law is concerned, there is today a requirement that a certificate of public convenience and necessity be secured from a Federal agency, where prior to the Natural Gas Act that did not exist. I am not clear as to whether the statute provides that in such an inquiry the Federal Power Commission considers the sufficiency of the reserves for the proposed line and proposed service. I do not recall that there is anything in the legislation that bears directly on that. I believe in Opinion No. 39, very recently, dealing with the Kansas line and the North Dakota line, the Commission did indicate that it had gone into the question of reserves for those two proposals.

I do not know that the problem of insufficient reserves and its possible effect would be considerably improved from the investor's standpoint under this new legislation. It depends on how optimistic or how liberal the Commission will be with respect to evidence on reserves. I can well appreciate that there might be some thoroughly wildcat undertaking which had no sanctions of any sort in terms of reserves which would be stopped. In the past, such undertakings were not stopped. I am not implying, however, that they were all of that character. I think there has been an improvement to the extent that this requirement for a certificate of convenience and necessity would keep that marginal type of undertaking out. I rather doubt that that is the most dangerous type of competition. Usually it is on a fairly small scale.

1352 I mentioned the possibility of a blackmail raiding line, just as a possibility. That was one of the possibilities that I considered in determining the hazards involved in this project. I think we settled yesterday or the day before that it was within the realm of possibility. I think we said we did not want to put it well up in the probability and we would leave it down around the possibility classification.

I agree with you that the possibility of a competing line going into the business with obviously insufficient reserves is reduced by the authority conferred upon the Federal Power Commission; but, as far as it applies to that wide range of possible error with respect to reserves, I do not see that the Federal Power Commission has necessarily added much. I refer to such a phenomena as underground reserves of gas and their estimation by fallible human beings.

People use difference methods of estimating reserves which bring apparently quite markedly different results. And there is a good deal of controversy as to which the appropriate method is. I think there is still a wide range with respect to the reserves which probably everyone would consider adequate to support a transportation investment. I am not acquainted with the section of the Federal Power Commission dealing with gas problems. I hope it is set up to be an expert body on this subject.

The point of my answer is that among the apparently accepted experts there is such an apparently wide possible difference that the situation still remains as I stated, and that is not inpugning the integrity or the honesty of anyone. They do seem to get widely different results.

As to the franchise problems, a number of situations could arise. A company may have an exclusive franchise or it might just have a franchise. It may have a short term franchise or it may have an indeterminate permit in effect, or it might have a long term franchise. The instances when these franchises come up for renewals are usually instances of rather sharp rebargaining as to terms. It is a type of hazard which has been unfortunately present. I would not say that it is unique to this industry. I mean it applies generally to the utility industry as a whole; in other words, there were certain things, for example, insufficient reserves, which do not apply to other types of utilities, but this franchise problem is one that applies generally to the utility industry as a whole. I can go along with you on that method of reasoning because I have used it myself. Assuming the common character, and then going into phases which differentiate it.

Referring to the effect of State regulation on this franchise problem I have always considered the substitution of state authority when it went to the extent of giving the state commission authority over the local circumstances, as being an improvement. However, we know quite well that that is not the fact in a great many states, and that state commissions unfortunately do not have as high a degree of control as we might wish them to have in that respect.

My position with respect to control is not so much what is done or the number of things that are done and all that, but is possibly directed almost wholly toward the question of how it is done and what principles are adhered to in the exercise of that authority. In other words,
1353 I do not want to be on this record as against regu-
lation of industries that I know should be regulated, or against the scope of regulation that is appropriate and necessary. Thus, the reference to original cost accounting in our early discussion, the determination of that does not bother me nor is it something that I am necessarily opposed to. What does concern us at times is the possible

use of the authority to carry out certain principles or certain theories of regulation.

My recollection is that for certain utilities in Illinois, the local community has a considerable degree of control or power. I recall franchise disputes in the city of Chicago, in which the city took an active part. My understanding is that the franchises there are not exclusive. That observation applies to the franchise of Peoples Light and Coke Company, as I understand it. I am not familiar with any recent decisions of the Supreme Court of Illinois dealing with the existing authority of municipalities over public utilities where their franchises have expired.

In stating the times earned bond interest by the Northern Natural Gas Company at more than 6 per cent in my testimony yesterday, I think the times interest requirements went to that issue and equal and prior issues.

I testified that I did not know what the times interest coverage of defendants would be if they were financed with bonds to the extent of 50 per cent of their capital. I do not believe that defendants could be financed on the same basis as the Northern Natural Gas Company. I have given consideration to some of the factors of comparison. In the course of covering the general information on Northern Natural which is readily available, I have made mental comparisons and observations with respect to factors which are more or less favorable. I believe the original capitalization of defendants was approximately $60,000,000. 40 per cent of that amount would be $24,000,000. 3¼ per cent interest on $24,000,000 comes to $780,000. I do not have the figures as to the earnings of this company last year that would be available for bond interest. I would not want to estimate those earnings. I would have to look up the income statement and I have not made the calculation. I am not sure that it is in the form to show the amount truly available for the bonds, as it would be in case they filed a prospectus, for example.

I do not have a copy of Exhibit 136. According to this exhibit which you have just handed me for the year 1938 these companies had net earnings of $9,910,000 after taxes and before depreciation, depletion and retirements. Depreciation, depletion and retirements apparently amounted to $3,232,633, leaving net earnings after taxes and before fixed charges of $6,678,029. You have done the calculations, but I will accept your figures.

How many times earned is that on the figure of $780,000? It is 8.55 times. The financing of the Northern Natural which I had in mind was bond financing of $16,000,000. I don't recall, there may have been also an issue of serial notes. There were bank loans in connection with some of this financing, but I don't recall what it was. I don't recall in connection with that financing that there was an issue of unsecured promissory notes due serially in amounts of $500,000 semi-annually, totalling $6,000,000 and bearing 2⅛ percent interest. There were such arrangements in some of these cases. I don't recall that the Chase Bank took that entire $6,000,000 issue of notes with the exception of a $200,000 participating interest to a Baltimore bank. It is my impression that a group of insurance 1354 companies took the $16,000,000 issue. I don't remember what companies they were. They were big companies, among the largest insurance companies in the country. The bond issue was relatively short as to maturity. By "relatively short", I meant to compare it to typical utility financing, which is 25 or 30 years. This issue ran to 1954, which would make it 15 years. I accepted your figures of $60,000,000 and 40 percent as illustrative. I would not presume to say what the value of the property is or what 40 percent of the value of the property would be. I don't know.

I testified at page 5777 with respect to the circumstance that, as stated by Mr. Morgan as shown by this record, 40 percent of the total volume of gas carried by the Natural Gas Pipeline Company of America is sold under interruptible contracts for industrial use, and that 25 percent of the total revenue is derived from that latter source. I have looked at the similar percentages for the industry as a whole and I have them with me. For the natural gas industry, the figure includes gas sold for electrical generation purposes. In 1938, as reported by the American Gas Association on a revenue basis, it is $126,682,000 out of a total of $416,580,000 or just over 30 percent.

In 1938 industrial and electric generation gas sales to customers amounted to 759 million thousand cubic feet out of 1 billion 213 million thousand cubic feet. That is over 60 percent by volume. So, as you put it, the industry must sell over 60 percent of its volume in order to get 30 percent of its revenues, as contrasted with these companies which must sell only approximately 40 percent of their volume in order to get approximately 25 percent of their revenue. That is an accurate statement of the broad facts.

The natural gas industry should not be similar to a gamble in a lottery. I have some reservations, however, since certain aspects of the natural gas industry pretty nearly approach that. It should not be in that status; and the operations as a whole are hardly so designated, but there are aspects of it that seem to fall in that category: It appears to be the developing national policy to take this basic natural resource and basic industry out of the realm of wild speculation. I am not sure to what extent it will accomplish it.

(Objection by Company Counsel overruled)

I testified on direct examination that the naural gas production and transportation industry does not have the legal status of a public utility. I think the definition of a public utility from a legal standpoint is first found in Smythe versus Ames. I think it was pretty well developed in the Wolf Packing Company case, where the court decided that the meat packing industry was not appropriately designated as a public utility. This question was discussed at an early date in the Patterson Gas Light Company case, in the Milwaukee Gas Light Company case, in the Williams case, I think it is—in the effort to place oil distribution in the public utility category in the State of Tennessee—Williams versus the Standard Oil Company if I am correct, and a direct or indirect reference to this subject is given in most of the important cases involving public utility rate determination.

I think my testimony at page 5657 et sec. deals primarily with the economic phases of the legal classification. I think there are only implications there as to what economic characteristics or circumstances the law has more or less regularly recognized.

1355 One of the commonplace requisites stated at page 5657 is "a high degree of the control over the market, more or less casually referred to as a monopoly." That is one of the tests that the courts have usually looked at.

No other natural gas pipeline company has immediate access to the Chicago market. None are occupying it. There is nothing legally to prevent one from doing it. I can not say as a practical matter whether any other natural gas pipeline company has access to the Chicago market. I am not aware that any other company has legal authority from the Illinois Commission which would give it access to the Chicago market. I do not believe any other company has legal sanction from the Federal Power Commission which would give it access to the Chicago market. As a legal matter, no other company has access to the Chicago market at the present time. I think it is more of a practical matter in view of the terms of the question. Actually no other pipeline today has access to the Chicago market. It might be a question of the actualities of today and of the possibilities of the future. I think there is that distinction. As one practical matter, no such line has access. As another practical matter, it might have some future access. At the moment no other line has access; but that is not what I have in mind as concerns the investor, which is the possibility of such a thing happening.

As a practical matter, if the Peoples Gas Light and Coke Company wants natural gas today, it must buy it from the Chicago District Pipeline Company, which in turn must buy it from Natural Gas Pipeline Company of America. I think there is sufficient uncertainty, as to what the future might develop with respect to the possibility of their buying from someone else is a consideration. I have made no calculations as to the price at which the Peoples Gas Light and Coke Company would have to buy gas from somebody else. I am not saying that there is a reasonable probability today that Peoples Gas Light and Coke Company will be able to buy natural gas from any source other than its present source during the terms of the existence of the contract between Chicago District Pipeline Company and Natural Gas Pipeline Company; but there are other considerations which must be brought into that picture before you would come to such a conclusion. I think it is something the investor would be concerned about. I think there is a possibility. I do not think the probability is great. Before I can say whether or not there is a reasonable probability, I must know what "reasonable" means.

I know what I mean when I use it, but I am not so sure that people who hear it have the same meaning that I have, and I am not sure that you have the same one in mind. I would say that it is a possible thing that is appropriately considered as a possibility. As the situation stands at the moment, there is no great probability. The reason I hesitate to use the term "reasonable probability" is that I think it implies a degree of judgment. I do not think the term "great probability" is precise. I am not making any distinction between precise thinking and refined thinking, but this involves factors which are outside of the realm in which refined economic thinking may well go. It involves considerations of technical, engineering and geological matters which I have to face in the same way that an investor would face them. I think if "reasonable" is construed in the sense in which I use it, that there is a reasonable probability that alternate supplies might be provided for the Chicago area.

1356 To be perfectly frank with you, Mr. Slaff, I am not in a position to calculate the technical aspects of a possible extension, for example, from the Panhandle line to the industrial area of Chicago. I think an investor looking at the situation would note that such a thing might happen. The fact that this company does not have an exclusive position and is not, under the Act, necessarily protected in its own position, together with these other observations, creates a relationship or a circumstance which the investor would give consideration to.

I have not made a calculation as to the price at which natural gas would have to be sold by someone else to Peoples Gas Light and Coke Company in order to allow the latter to buy from some other supplier. I have a number of other things in mind, however, that bear on the question, that you have not asked me about.

The contract under which gas is supplied to Chicago District Pipeline Company expires in 1946, but it is extendable at the option of the defendants for five years thereafter. I am speaking of the firm contract. I do not know about the contracts for industrial gas. I don't know whether the 25 percent of the company's revenues deprived from interruptible contracts is all derived under the short term contracts mentioned here or not.

I testified, as appears at page 5657, that: "normally, the practical economic monopoly which follows from the character of the investment is recognized by the law as a legal status in addition to the economic status."

The term "legal status", as I understand it, is one's standing in law consisting of say the balance of rights and duties as a natural or artificial person. The balance or rights and duties as a legal status of defendants has not been too clearly recognized as yet. We look to decisions to tell us what it really means. New law creates uncertainty for some period of time. I think that it is accurate to say that they have attempted to identify the legal status, but they do not call defendants a public utility, if I remember my last reading of the Act.

The point of distinction that I had in mind was that it did not appear from the legislation or what interpretations are now available, that such a legal recognition and status are granted to the units in this industry. Thus, for example, we do not have public utility situations where the legal status is rather well developed. On the contrary, there is a provision that anyone who offers to sell for less must be considered and be allowed to enter the market. There is a specific provision in the law to that effect. I think it is quite fundamental to my way of thinking. It appears to be the law. I think it is fair to say that that conception is fundamental to my thinking on the subject.

Defendants sell all of their production in the Chicago area, I believe, to the intervening company, the Chicago District Pipeline Company. I believe they sell approximately 10 percent of their production to other customers. I have the impression that those customers are along the line previous to reaching the connection with the Chicago District Pipeline Company. I don't know what prices are offered at those earlier points. I did not look into
1357 that. I do not know what the prices are for that 10 percent. I did not attempt to find out. It seemed to be a small proportion of the total.

I stated that the fact a public utility may reasonably discriminate in price among different classes of consumers, is one of the legal characteristics of a public utility. I did not make any attempt to determine whether this company could engage in such reasonable discrimination when I was preparing my testimony on the subject. I considered that 10 percent as relatively unimportant; and as this company is a wholesaler not reaching the various classes of consumers, I did not consider that that matter entered into the question. Chicago District Pipeline Company, as I understand it, purchases 90 percent of defendants' production. I don't know the names of the people who take the other 10 percent. I don't know how many customers there are that take the other 10 percent of the total production.

1358 E. M. SOLOW, a witness for defendants, called for cross-examination, testified:

(November 1, 1939.)

Cross-Examination by Mr. Booth.

It is not quite correct to say that I participated in the preparation of the figures shown in Exhibit 122. I did not prepare any of those figures. I simply suggested the valuations which were used in compiling those figures. The figures of costs and so on were taken from the records of the company by Mr. Davidson and his staff. Using those figures which they furnished us, we determined the salvage value. That was the extent of the figures which I used. I stated that my conclusions were based on the result of many years of experience in connection with the sale and purchase of oil field equipment both new and second-hand of various types.

I am now an officer of the Western Supply Company whose business is that of purchasing and selling oil field equipment. The property as to which I testified concerning its salvage value included pipe forming the casing or lining of gas wells, pipe fittings making up the gathering lines in the gas fields, the steel frame buildings at compressor stations, wooden cottages at compressor stations, water well equipment, cleaning out tools and other tools, tanks and laboratory equipment, booster station equipment, miscellaneous equipment and warehouse stock. I also testified that I agree with Mr. Taubman that the main pipe line would cost more to salvage than it would be worth. That statement applies also to the various river crossings.

I testified that the list of items appearing at pages 4077 to 4082 of the record, which Mr. Davidson stated would be non-salvagable but which were not listed in his Exhibit 122, would not be worth salvaging in my opinion. These estimates as to salvage are set forth in Exhibit 122. As I stated, I examined the exhibit generally and am in general agreement with the salvage values shown in the entire exhibit. I expressed the opinion, I believe, in connection with one or two items, that I might not have given them as much salvage as others did, and as to one or two other items I believe I explained that I had given them some salvage value where other witnesses did not believe they had any; but I believe in the exhibit the highest salvage value that anybody gave these things is always set out.

My estimates of salvage value were based upon 1939 conditions. I tried to put myself in the position of a buyer who was offered this material, at the time I testified, as of approximately June 1, 1939. I made no effort to predict the prices or other conditions with respect to salvage which might exist fifteen or sixteen years from now, except I commented to you then, and it is still true, that in dealing with used material you are always dealing with material of some age. It might be five years old or ten years old or fifteen years old. That is what the used material business is.

1359 I think the fact that this equipment and property might be five years old, eight years old, ten, twelve or fifteen years old, or twenty years old, would have a great deal to do with the value of the property, as would the kind of use that it had—it is just like anything else. Of course you always have to consider your buyer for used property. It is very easy to sell a gas engine that has been used on a well three months and the well goes dry and the man wants to sell it. If you have one that has been used twenty years, that is an entirely different proposition. It is not worth very much. It is just like any mechanical thing. If you were buying an automobile that had been driven a thousand miles, you might consider buying it at a cost of a nice saving over the cost of a new one; but if it had gone a hundred thousand miles, you would not want it at all.

If we assume that the equipment and property had been used eight years as compared with ten or fifteen or twenty years, I think it would make a substantial difference as to what it would bring. As to how much difference, it is hard to answer that question offhand. It would take considerable study to arrive at any proper answer. At this time I would say, if you are talking about the main pipeline system, that it would not make any difference because all of the conditions under which that line is worthless from a salvage point of view are the same whether it is one year old or twenty years old. If you are talking about an electric motor, one with eight years of use is certainly worth more in salvage than if it were twenty years old. If you are talking about all of this property together, I don't see how I could answer that question directly without studying it. In other words, if a thing is not salvageable at all, it is not salvageable whether it has been in the ground five years or fifty years; but if it is salvageable, the age and condition of it certainly make some difference in the value. If you had the mail pipeline salvaged, it would have no salvage value either now or when it is twenty years old. If the line were abandoned and offered for sale today when it is eight years old, it would be worthless just the same as if it were offered for sale when it was ten years old or fifteen years old.

The gathering lines would have a salvage value and we have given them a salvage value here. Pipe that has been in the ground and used for eight years would probably come out of the ground in better condition than if it had been twenty years, and I believe it might have some slightly higher value. The real increase in the value would be in the machinery.

When I testified a few moments ago that the main pipe line would not have any greater value if eight years old than if twenty years old, I meant that it is an item that cannot be salvaged and put back into economic order, so what is the difference how old it is?

There might be some small difference in the value of the casing. You get out about the same amount of it when you pull it out of the well, but if the pipe is only
a few years old it would have a better sale value
1360 than if it were fifteen or twenty years old. When
I say "some small difference"; I think it would be
a reasonable way to explain my meaning to say that I have something like five, ten or fifteen per sent as the difference in salvage in mind. In other words, if we pull pipe from twenty five wells today and the pipe has been in some of those wells five years, if it is pipe that has been made within the last five years and is recognizable as such, and it is the length of pipe that can be used, that is one thing; but if we also pull pipe twenty years old, it is much more difficult to sell that twenty-year-old pipe than the five-year-old pipe.

There would probably be much less variation in the value of steel frame buildings at the compressor stations than pipe which is in the ground where it is being rusted and

and utilized more. A steel building is an entirely different thing than a piece of pipe. A steel building twenty two years old would be worth very close to the same amount that it would if eight years old. The difference would be very small. It might be five per cent. In salvage I consider 5 per cent small, because, after all, if the material, for example, sells new for $80 a ton and sell used at $20 a ton, 5 per cent of that $20 is a pretty small variation.

I don't think it would make very much difference in the value of wooden cottages whether they were eight years old or twenty or twenty two years old because we presume they will have been kept in good order. There would be as little use for them if they were abandoned now as if they were abandoned later, and the little value that was placed on them was placed there because you could not do anything with them after they were abandoned. There would not be any market for them.

In discussing water well equipment, we discussed the motors used in connection with the pumps, and the pumps themselves. Our opinion was that these pumps would have to be left in the bottom of the wells because they were not worth salvaging. That is just as true if they were eight years old as if they were twenty two. The motors, however, would have a slightly better salvage value if they were not twenty two years old but only eight years old.

When I discussed cleaning-out tools, those are tools that are used in the Panhandle in connection with drilling operations, I made the comment that no prudent contractor would use drilling-out tools or cleaning-out tools that were fifteen or twenty years old without knowing that they were in good shape and being assured of it, because the trouble that he would encounter in using them would offset the saving in buying them. Naturally, if those tools were not as old as they might be and apparently they were in better shape than they would be at the end of a long period, they might have some small value beyond that which was given, but it would not be substantial. You might get ten per cent more for an under-reamer that was eight years old as against one that was fifteen years old. That would be about my notion of the difference in the salvage value.

There would also be a small difference in the salvage value of tanks. I think that in analyzing the laboratory equipment we should presume it was being constantly replaced and so always right up to the minute. It is not like a tank that stands there for fifteen years with 1361 the same bottom. When one breaks you put in another one and we give, for that reason, a high value on the laboratory equipment. I do not think there would be any difference at all in the value because actually in practice you would have new material in your laboratory.

There is a good deal in the booster station equipment that had no salvage value at all, as I recall it. I think I discussed page 93 of Exhibit 122 with reference to the Cooper-Bessemer engines listed in detail on that page. At this time only one of these engines is installed. It is the engine that Mr. Wally Smith and I drove out to see in the Panhandle. There would be a difference in the value of booster station equipment as between the ages of eight and fifteen years. Of course the kind of use that it has had during the time would enter into it, because the condition of machinery always has a bearing on its resale value. It may make a great deal of difference. It is just very hard to make a generalization, because one machine may be worth ten per cent of its new price, another may be worth nothing or fifty per cent of it, depending upon a lot of circumstances.

As to the miscellaneous equipment referred to on page 4184, some of this material, like the thermometers and gauges and things of that kind, are just like laboratory equipment. They would be kept up to date. I presume that would be true of this fire-fighting apparatus, and when we value that for salvage we presume that it would be in first-class condition at all times and when the stuff was old it would be replaced by other stuff. As far as any machinery items in that equipment are concerned, it would be subject to my comment that age would cause a variation in the value of it. The difference would not be very great unless there was some reason for its being great.

The warehouse stock would be subject to the explanation that I gave on the different items that compose it. Some of it is pipe, some is fittings and some is pump parts that would have no value at all, and where that is the case it would not make any difference how old they are. If it were an item that in the general stock was improved by youth, that would be true of the item in the warehouse portion of the stock also.

As to the items that Mr. Davidson testified were nonsalvageable it would make no difference whether they were eight or nine years old or twenty or twenty three. Those items would be worthless if salvaged five minutes after they were put in. Take a road marker, for example. If the line were gone, the marker would be worthless. Take the telephone system right of way. If the telephone system were taken away, the easement or right of way would have no value. I think that is the general type of this stuff. It is stuff that you could not even give away when you want to get rid of it. Concrete blow-off pits are just a nuisance. Pipe rack foundations are always covered with oil and you have to clean them up. They are worth nothing. Curb, sidewalk, sewerage system, signs,—such things are no more salvageable the day after they are installed than twenty years after. Age has nothing to do with it. If you build a concrete road out here on the wrong section line, it is just as worthless as if it had not been built. I don't know if my answer is clear. What I meant to say is that once this money is spent and the project is abandoned, whether it is one day or ten years; it doesn't make any difference on that type of item so far as the salvage value is concerned.

1362 *Cross-Examination by Mr. Slaff.*

Yes, I testified that I have been in the business of buying and selling oil field equipment in Texas for about fifteen years. A large part of that time I have been in that business in the Texas Panhandle field. I forget just what year it was, but shortly after the Panhandle oil field was discovered I went out to Pampa and lived there four or five years. First I had a business of my own and then when the Western Supply Company arranged to enter the Panhandle I made arrangements to enter employment with them. They took over my stock of materials and I represented them in the Panhandle in trading in used materials for two or three years.

I have not dealt with Texoma or the Natural Gas Pipeline Company of America. My firm has not dealt with them. It is a remarkable thing, Mr. Slaff, but I believe that Texoma is the only concern in the Panhandle that we have never sold a nickel's worth of merchandise to under any conditions or at any time. We have never purchased any used equipment from them. We have not dealt with them at all. We handle gas equipment as well as oil equipment. The same equipment goes into gas wells that goes into oil wells, except that oil wells are usually tubed and gas wells are not usually tubed unless they make a certain amount of fluid which has to be drawn off with the gas. Otherwise it is the same.

I testified that I had drilled a great many wells in the Texas Panhandle field. I suppose I am interested in about fifty wells in the Panhandle section at the present time. We have abandoned a few wells and drilled others. I think that is about as many as we have ever been interested in out there. These wells were drilled over the last ten years. They are scattered over the field from one end of the Panhandle to the other. About half of them are gas wells and about half are oil wells. We drill all our wells with rotaries, except one lease in Hutchinson County which we drilled with cable tools. As to the procedure we use in drilling in, it depends upon what part of the field we are in. We have generally used new material in our own wells. In drilling our gas wells in Wheeler County where the wells are shallow and where they are set about 1,400 feet apart, I believe we used used material on those shallow wells. In Gray County where we drilled mostly oil wells, we have used mostly new casings. I would say in about 20 per cent of our wells we have probably used used casings. In Hutchinson County I believe we have used new casings in all of our wells for the oil strings, and where we have used other strings, if we had it we used used pipes; otherwise we bought new.

I ought to know the total number of wells that have been drilled in the Panhandle field but I really don't have it in mind. I probably have seen it in print a hundred times but I have never paid any attention to it.

In the early days of the Panhandle before the rotary method was well developed, wells were drilled by the cable tool method exclusively. I was up there in that early time and we used to sell a good deal of stove pipe to put into those wells, because the operators could not get the
1363 other casing in those wells on account of the quicksand. They were expensive to drill. About ten years ago, I guess it was, they started drilling most of the wells by the rotary method and that is now the method generally used in drilling wells out there. Stove pipe is oil well pipe that does not have collars and threads and it is driven into the well with a driver. The reason they use it is that the collar does not bind in the quicksand and the

pipe slides down with the proper pressure. In the first two years in the Panhandle field I sold about 60 cars of this stove pipe. In the last ten years I have not sold, and nobody else has sold, a foot of it. It shows the change-over in the method. The bulk of the drilling of gas wells in the Panhandle field is now done with rotary tools.

According to my data on Texoma's wells, there were 39 cable wells drilled as of June 1, 1939, and 120 rotary wells, making a total of 159 wells. The company prepared for me a list of all of the wells with all of the pipe in them, but I do not find it. I was referring to Exhibit 122, page 50-A.

As appears on page 4163, I based my net salvage value per well for Texoma of wells drilled with cable tools, on 15 wells. In my judgment these 15 wells are representative of all of the Texoma cable-drilled wells. From the list of all the wells I took the first 15 on that list and added up all of their materials. I looked through the whole list carefully and the amount of pipe in those 15 wells was representative of the entire group of wells. When defendants asked me to state the salvage value of those wells, I asked them to make up a list of each of their wells with a list of all of the materials in them, which they did, and as they sent it to me the rotary wells and the cable tool wells were all in one list. I just selected the first 15 cable tool wells which were average wells. I believe I have my original work sheet on that. As stated, I looked over the list and those 15 wells were representative of the list.

On page 4161 I testified that the casing in nearly every cable tool hole is line cut. That detracts from the value of the casing when it is pulled out. I don't think that this line cut detracts from the value of the casing while the well is still producing. There is no loss of value due to that fact so long as the well is producing. The pipe is already in the well and is performing its function. After it has stayed in the well and it is grooved by the whipping of the line, it does not make any difference. It is already there and as long as it is holding out and not leaking, the pipe is doing its job and the well, as long as it produces under those conditions, is just as good as if there were no line cut. But if you pull that pipe out of the well and it has that groove in it, nobody is going to buy it. It is just junk. A pipe is no thicker than the weakest portion of it, and if a pipe has a line in it or the wall has a groove in it, it certainly has not much value for any purpose at all. You never know that it has happened until it is pulled out.

You see, pipe is built to a 700 or 800 or 1000 pound test,
but when two-thirds of the thickness is found at some
1364 place in the pipe where there is a groove in it, the
pipe is not good for that test any more. It is just a
gamble if you want to use it at all, and no company that
has any respect for engineering figures will run a line-cut
pipe in a well.

At page 4169 I testified that I was buying pipe from National Tube and Republic Steel for $45.00 per ton less 10 per cent. I was referring to wholesale purchases made by the Western Supply Company of lining pipe. That is a special order. Those prices of course are at the factory. One reason for the variance in the price is that the size of the pipe makes a difference in the value, and another reason is that during the early part of last summer there was a pretty large stiffening of the line pipe market. It did not seem to reach bottom. There was a lot of competition in dealer sales. Customers were buying pipe on discounts beyond the ordinary resale list.

At page 4172 where I testified with respect to the compressor station buildings, I stated that some of them were too large for other uses. I was talking about the main compressor buildings. I said those buildings were too large to be moved around to other places in the oil fields and put into use again. They are larger than the buildings that are used in any gasoline plants or ordinary construction that goes on and would have to be cut down before being used again for that kind of a building. The smaller buildings that could be moved we gave a 10 per cent valuation, and the larger ones 5 per cent for the reason that they would have to be cut down and refabricated. You can tear the smaller buildings down, move them around and use them to better advantage. In spite of that they would have a value of only 10 per cent.

1365 W. C. GILMAN, recalled for cross-examination, testified:

(November 1, 1939)

Cross-Examination by Mr. Slaff.

Yes, in the course of my direct testimony I testified generally with respect to the comparative risks of different types of utility industry, using the latter term very broadly.

I testified that the electric industry was less risky or offered greater security than the manufactured gas industry. That is my present belief and was my belief, of course, at the time I testified. It was no conclusion I reached shortly before my testimony here. It is of long standing. It is a long standing feeling that I have had.

Yes, I then proceeded to go on to a comparison of manufactured gas distributing company with a natural gas distributing company which latter did not own its own production and transmission facilities, and I observed that the manufactured gas distributing company is safer than the latter. However, I said in that connection that from a short range point of view, the company now distributing natural gas was in a better position to meet competitive markets. Looked at from a long range point of view, you would have to take into consideration the possibility that natural gas might not be available to the company and that the change-back might be necessary.

In forming my opinion as to the rate of return, I formed it on the basis of present day conditions and looking to the future insofar as I can with any degree of certainty. I think you are correct in summing up my statement that in arriving at my judgment of a fair rate of return, I was taking the long range point of view as against the short range point of view as I have explained those two terms here.

Yes, I then went on to testify that a natural gas distribution company was safer and less risky than an integrated natural gas system, the latter being defined as a company or system owning its distribution, transmission, and production facilities. That is my present judgment. That is a conclusion I have long had. However, ones ideas change as time progresses. I do not think I had exactly the same feeling, for example, in comparing the manufactured gas industry with the electric industry in 1929. Things have taken place since that time which have caused me to have an opinion at this time with reference to the relative attractiveness of investments in the two types of business.

Yes, from there, I went on to compare an integrated system, as we have just used that term, with a company owning simply natural gas production and/or pipeline facilities, and stated my conclusion that the integrated system was a safer proposition than the one owning only gas production and/or pipeline facilities.

Yes, I then went one step further and compared natural gas production and transmission systems having a number of sources of supply with one which relied on one source of supply only, however large that source of supply may be, and came to the conclusion that generally the former was a safer investment than the latter.

Generally speaking, my conclusions from the last two comparisons I have held for some length of time. In that line of testimony, I was dealing solely with the inherent differences in risks between the different classes of
1366 business. That is one way to express it. In other words, I was assuming for the companies or systems I was comparing that all factors were equal insofar as they could be equal in comparing really different kinds of business. I was assuming that competency in management was the same; that the skill of the operating organizations was the same; that they were serving the same territory or type of territory, as the electric company in Boston against the manufactured gas company in Boston, for example; and that same generalization applies in my comparisons between manufactured gas distributing companies and natural gas distributing companies, and natural gas distributing companies owning no production and transmission facilities and integrated natural gas companies, insofar as the comparisons were possible or where the comparability could be maintained. That extends right down the line in those comparisons I made.

Some of the other factors included in these might be the same degree of soundness in capitalization; relatively the same franchise terms if a franchise should be required; the same relationship to a holding company if a holding company was in the picture; the same type of regulation; in fact all other factors were assumed to be equal.

In other words, the only difference was in the risk inherent in the different types of industry, coming about primarily because of the uncertainty of the future.

I can not say what percent of the fair rate of return I conceive to be a fair differential on account of the differences in the risk inherent in the type of industry between an electric company and a manufactured gas company without making a study on that point. I would not say what the proper rate for any particular enterprise would be, much less that covering whole industries, without very detailed studies. I can not express the differential in terms of per cent.

We have advised other people with reference to investments. I do not call myself as "investment counselor." As that term is ordinarily used, it implies a person who generally gives advice in the matter of making investments. We do not, generally speaking, hold ourselves out in any such capacity. We are financial consultants, primarily in the public utility field. We advise underwriters and institutions. We advise corporations in the development of plans in connection with the sale to the public of their securities.

I have given a great deal of thought to the difference in risk between the different types of utilities that we have just discussed. I have given thought to the reaction of the investor to these different risks. I have attempted to evaluate the difference in the reaction of an investor to securities of a manufactured gas company as compared to securities in an electric company, and to be specific I think I can point out an example:

I testified in the case of the Brooklyn Union Gas Company, an artificial gas company, that in my opinion the rate of return should be not less than 7%. In the present case, I testified that, in my opinion, not less than 8% was required. There is a concrete example of my evaluation of the risks involved and translated into percent of return which should be required by investors.

1367 I can not answer your question as to the differential in the percent of rate of return between an electric company and a manufactured gas company. That problem has been a matter of continuous thought with me. It is impossible to evaluate it in terms of actual percentage. I do not find it impossible to evaluate the probable overall in terms of percentage for this company or for the Brooklyn Union Gas Company.

I do not think I have ever come to any conclusions in my own mind as to the upper and lower limits of fair rate of return for the electric industry as a whole or for the electric industry on the average. I do not think of rate of return as a thing you can talk of for an industry. It must be considered specifically in each case. I have given consideration to a great many things in forming my opinion. I do not mean I have given consideration to a great many general concepts. I think I gave a great deal of consideration to a great many specific concepts and I came to the conclusion that there was a difference in safety in an investment in the electric industry and in the manufactured gas industry. That is a general concept. I had no difficulty in directing my thoughts along the lines of general concepts, when I particularly said "generally speaking".

No, I can not give you any indication of the differential in rate of return that I conceive to be the fair differential on account of the differences in the risk inherent in the types of industry. I hesitate to express any differential of that character without more careful consideration. Rate of return is something that has been of some significance to me and some study by me since 1928 at least. My own activities in actual rate cases extend over a period of about one year. During that year, I have testified in the Rochester Gas case, the Brooklyn Union Gas case, and this case. My partner testified in the South Carolina Electric and Gas case, which was an electric rate case. My partner testified in the matter of rates for the electric department of the Georgia Power and Light. That makes a total of five cases in which we have participated in the last year.

I have been giving pretty intensive thought in the past year to the problem of rate of return in electric and gas companies. We have a substantial other business though. Yes, I gave that subject considerable thought while I was director of the Public Utilities Division of the Securities and Exchange Commission—more indirectly however. More directly, I gave that matter considerable thought and attention when I was in the treasurer's office of the Equitable Life Assurance Society.

No, I am not prepared, after ten or eleven years of regular thought on the subject to state in terms of percentage the fair differential in the rate of return between an electric company and a manufactured gas company because of the difference in risk inherent in the different types of industry. I have stated that generally the gas company or the manufactured gas company is, in my opinion, a riskier type of business from the investor's point of view than the electric business, but I can not tell you in terms of percent how much riskier it is. I cannot tell you in terms of percent how much more risky the manufactured gas industry is than the electric industry, nor how much more risky the natural gas distribution business is than the manufactured gas distribution business. I cannot tell you in terms other than in terms of percent how much more risky the natural gas distribution business is than the manufactured gas distribution business, except that in my opinion one is riskier than the other. I cannot tell you how much more 1368 risky the one is than the other either in terms of percent or in terms other than percent. I cannot tell you in terms of percent how much more risky the integrated natural gas system is than the natural gas distribution system which does not own its production and transmission facilities, nor can I tell you how much more risky the one is than the other in any other terms. I cannot tell you in terms of percent or in other terms how much more risky the natural gas company owning simply natural gas production and/or pipeline facilities is than the integrated company, as that term has been used here. I cannot tell you in terms of percent or other terms how much more risky the natural gas production and transmission system having but one source of supply is than the natural gas system having several or a number of sources of supply. In reverse English, my answer would be the same if you were to ask me how much safer one of the industries is than the industries with which it was compared.

Questions by the Examiner.

No sir. Those answers cannot be worked out from pages 1 and 2 of my exhibit in any way. The question Mr. Slaff is asking is to state the differential in the rate of return that would apply between two industries, one, say, an electric industry and the other the manufactured gas industry. I testified that there are differences in risks, generally speaking, along broad lines, but in forming my opinion as to rate of return I have to take into consideration one company and the characteristics of that company and evaluate the risks of that company as I see it, not only as compared with these other industries, but with the risks in other industries and other investments which are available to investors. No, I do not think you can take a combination of the data on pages 1 and 2 and work backwards by examining the characteristics of the company, and identifying any degree of risk which would attach to any one of these companies as a differential.

I think I can illustrate that in this way: The common stock of the Oklahoma Natural Gas Company is shown on page 2, having an earnings price ratio of 14.10 based on the price at 9-15-39, and earnings per share for the twelve months ended June 30, 1939 of $2.24. That company is an integrated natural gas system owning a substantial amount of the production and buying gas also from a large number of rather small fields in the State of Oklahoma. It controls distribution facilities in Tulsa and Oklahoma City and many other large communities in Oklahoma. It is one of those companies that I have said was less risky than a natural gas pipeline company which had no distribution.

There are pipeline companies in this list owning no distribution at all whose securities are selling in the markets on a lower yield basis or a lower price earnings ratio, the reason being that there are other factors about these companies, factors such as capitalization, past earning record, the territory served, and things like that which brought down to specific cases indicate, in spite of my general belief that Oklahoma Natural is a less risky company, generally speaking, than the El Paso Company, that investors, however, because of other things which are inherent in the two situations, give them a different rating in the market. In other words, this is only one of the factors that enters into a judgment as to a proper rate of return for a particular company.

Cross-Examination by Mr. Slaff Resumed.

1369 Yes, I testified on direct at considerable length to the fact that the electric industry was safer than the manufactured gas industry, the manufactured gas distribution system was safer than the natural gas distribution system, and so on down the line, but I can not tell you now whether the difference in the rate of return that I conceive to be a fair difference because of that one factor, is one-tenth of 1% or 1% or 2% or what it is, because in specific instances, in spite of the generalization which I have testified to, I might testify that a natural gas pipeline company which had distribution facilities might be entitled to a rate of return of more than 8%, depending on the facts as I found them in that case.

If an investor should come to me and advise me that he is faced with two alternatives, an investment in an electric company and an investment in a manufactured gas company and all other things being equal about the two companies, I would not advise him as to any differential in the rate of return he should require in order to make it a proper investment for him to go into the gas business. I think it should be stated that the investor faced with this problem might take into consideration the fact that the courts and commissions have handed down decisions in the past few years with reference to the rate of return of electric companies, gas companies, telephone companies, and water companies. That might be one indication of the differential, but I cannot state what the differential would be or should be, even if all other things are equal.

I would say that the experience of the past few years has demonstrated that investors are more willing to buy the securities of electric companies than of the manufactured gas companies. It is extremely hard to say whether the experience of the past few years would indicate that investors are more willing to buy the securities of manufactured gas distribution companies than natural gas distribution companies. I have no opinion about that.

I have kept in touch in the last few years with what has gone on in the investment market, particularly in the public utility investment market. As I have said, it is very easy from proper knowledge and experience of what is going on in this country, to take cognizance of refunding and the amount of new securities sold to the public in the last five or ten years. Everybody knows that the electric companies have gone through great refunding programs and that the gas companies have not gone through with refunding programs to anywhere near the same extent. Therefore, it is easy for me to answer whether or not investors have been more willing to buy electric securities than gas securities, but when it comes down to answering the question as to manufactured gas companies versus natural gas distribution systems, it is much more difficult to answer because the latter companies have converted, have gone from one type of gas to the other. I have no way of forming a basis for such a judgment.

I have not given consideration to the latter question in that form. I watch every security issue that comes out. I don't think that knowing the absolute amount of securities sold in recent years in either of those two classifications is of any great importance. As I understood your question, you asked me the relative willingness of investors to buy the securities of manufactured gas companies as compared with companies distributing natural gas in recent years, and I have tried to answer it. There are two unknowns and you are asking me for the differential. To determine the differential, you have to know each of these unknowns. I cannot answer your question as to whether the experience of the past few years as demonstrated by investors is that they are more willing to buy the securities of natural gas companies, distribution, or artificial gas distribution.

Investors bought the securities of the Washington
1370 Gas-Light Company two or three months ago in a
substantial amount, and investors a year ago bought the securities of the Michigan Consolidated Gas. Those, as I remember it, are two of the most important securities gas distribution companies offered in the last couple of years. Both securities were bought by the public. One was bonds and one was common stock. I was familiar with both. I cannot state a differential in the investor's attitude exactly between these two. I cannot answer your questions as to the difference in the attitude of investors toward the securities of these two different types of gas companies in the past two years. I do not believe it is capable of measurement.

My answer to your question as to whether investors are more willing to buy the securities of natural gas distribution companies or of integrated natural gas systems is the same. I cannot say. I don't think you can measure any of these things by the turn-over on the stock exchange, because in the first place a great many of these companies' securities are not listed on the national exchanges. They are traded in over the counter. I do not know whether any statement of the volume would be indicative of the questions that you are asking. There may be a terrific volume at a decline in price.

You asked me if it is not a fact that when I was testifying on behalf of Brooklyn Union Gas Company about a month ago, I testified that the experience in what has gone on in the past few years has demonstrated that investors are more willing to buy securities of natural gas companies than they are of artificial gas companies. What kind of securities was I referring to? I would like to see the context of my statement in that case. I do not remember testifying in those words. I think I testified as indicated by the following questions and answers which you have read to me from the transcript in the Brooklyn Union case for September 18, 1939:

"Q. Would you say that an investment in a natural gas company is a better class than an artificial gas company like the Brooklyn Union or a manufactured gas company?

A. I hate to generalize.

Q. Oh, you have generalized all along.

A. I would say that yes, that in the past few years, experience in what has gone on has demonstrated that investors are more willing to buy the securities of natural gas companies than they are of artificial gas companies."

I think if you read the whole context there, that you will find that we were discussing bonds and the ability of companies to sell bonds. There have been in recent years many million dollars worth of natural gas pipeline bonds sold, particularly to institutional investors. While I was in the Equitable, we bought many million dollars of such bonds of short maturity with heavy sinking funds. At that time, we were not buying the bonds of artificial gas companies. Natural gas pipeline bonds were special types of securities and fitted a special position in the portfolio of the investing institution, and that is what I meant by investors being willing to buy the bonds of natural gas companies. I think that my answer to the question quoted must be read in the light of the previous testimony that I gave in that case. Yes, I knew that any answer I might give you now would be read in the light of my previous testimony. In my original testimony here, I testified to just what I told the Examiner a few moments ago concerning this balancing of securities in the portfolio of institutional investors. I think I recollect that he stated that during the last five years, institutions had bought very large amounts of bonds of natural gas pipeline companies.

1371 The Brooklyn Union Gas Company is an artificial gas company. I have testified in their behalf on the rate of return. I have not received a fee in that case as yet. I have contracted for a fee but have rendered no bill for my services. I have no doubt whatever about receiving my fee from that company. I had no hesitation in testifying in that case that "in the past few years, experience in what has gone on has demonstrated that investors are more willing to buy the securities of natural gas companies than they are of artificial gas companies."

If we add up the amount of securities sold in the last ten years in two columns, one natural gas companies and the other artificial gas companies, I have no doubt that under the column on natural gas companies the amount would be greater, and I have no doubt that investors are more willing to buy the securities of natural gas companies than they are of artificial gas companies. I don't think I had any such doubt ten minutes ago. I did not express an opinion on that. I did express an opinon as to that in the

Brooklyn Union case. I do not think the same question was put to me here.

Yes, on Friday before I left the stand, we were discussing the recent financing of the Public Service Company of Colorado. I remember that discussion. I remember that it was approximately in November, 1938 when that company first filed a declaration with the Securities and Exchange Commission. That declaration was subsequently withdrawn and a new declaration was filed. The second was filed several months ago, I don't remember the exact date. I think the reason for the withdrawal was to reshape the original proposed plan of financing. I have no intimate knowledge of it. The financing now is on a little different basis than it was then.

I assume that after the withdrawal of the first statement and the filing of the second statement or declaration, conferences were held in the usual course of business, as they are in the Securities and Exchange Commission, between the officers of that company and the staff members of the Commission. I think I know from my own knowledge that there were conferences.

An informed investor reading the S. E. C. release on that financing, would observe a statement in there with respect to the life of the Amarillo field. If interested an in investment in the Amarillo field, he might try to procure from the public files of the S. E. C. the data behind that statement in the release. I am not sure that he would. Some might. I happen to know people who were willing to buy the bonds of that company when they came out, and to my knowledge they never requested such information from the S. E. C. Some people might have.

An informed investor of the type I had in mind when I was discussing informed investors in my direct examination might, upon seeing the statement of the S. E. C. to the effect that the life of the field was estimated at 25 years or thereabouts, attempt to find out from the public files of the S. E. C. what was back of that statement. (Objection by Company Counsel overruled.) Not all people think alike. Some people might have gone to the S. E. C. and asked if there were a complete report by the Ralph Davis firm. I think I can probably generalize and say that the man who has more information is the better equipped. But I may say that I believe there are informed investors who would take up their position as to an investment of this kind in a substantial amount without going to the files of the S. E. C. although I think it is right to say that the investor who sought the information more closely approximates the informed investors I have in mind.

I made no effort to find out from the S. E. C. what 1372 was back of that statement which you read to me from the release on the Public Service Company of Colorado's financing. This release came out in August or the beginning of September. Of course, I had seen the prospectus part containing the letter when it was filed in 1938.

(At this point Exhibit No. 155 was withdrawn and a document described by counsel for the Commission as a certified document embodying what was offered in Exhibit No. 155 was produced by counsel, with the request that it be marked for identification. At the direction of the Examiner, the document referred to was marked Exhibit No. 155 for identification. EXHIBIT NO. 155 was received in evidence over the objection of counsel for defendants, who were allowed an exception.)

Questions by the Examiner.

In response to questions you previously asked me, I stated that, in my opinion, an investor in the bonds of Public Service Company of Colorado might well look at the statement in the prospectus and the registration statement and even might go to the Securities and Exchange Commission for additional material. That entire statement was with reference to an investor. As a part of my duty in determining a proper rate of return in this particular case, I satisfied myself that the gas field would last at least fifteen years, and I was not concerned beyond that period. I assumed that the Federal Power Commission or the proper authority will determine the proper amount of amortization and that was my assumption in my testimony as to rate of return.

In assuming a life of at least fifteen years and assuming that the Federal Power Commission establishes amortization, my point is that, even though there is a maximum life, there is a risk that the field might go down before that fifteenth year is met. That is a possible hazard.

(Counsel for the Commission then produced a document which he described as the facing sheet of the same registration statement as contained in Exhibit 155, together with page No. 62 from said registration statement, with the request that it be marked as an exhibit. At the direction of the Examiner, the document was marked Exhibit No. 158 for identification. EXHIBIT NO. 158 was received in evidence over the objection of counsel for defendants, who were allowed an exception.

Counsel for the Commission then produced a document described as the facing sheet contained in the registration statement filed with the Securities and Exchange Commission August 30, 1939, by Public Service Company of Colorado pursuant to the provisions of the Securities Act of 1933 as amended, under file 2/4180, and pages 5 and 6 as contained in said registration statement. At the direction of the Examiner, the document was marked Exhibit No. 159 for identification. EXHIBIT NO. 159 was received in evidence over the objections of counsel for defendants, who were allowed an exception.

Counsel for the Commission then produced a document which he described as a certified copy of the facing sheet of the same registration statement referred to in connection with Exhibit No. 159, together with page 57 of said registration statement. At the direction of the Examiner, the document was marked Exhibit No. 160 for identi-
1373 fication. EXHIBIT NO. 160 was received in evidence
over the objection of counsel for defendants, who were allowed an exception.

At this point, at the direction of the Examiner, the reporter copied in the record the following statement beginning at the bottom of page 4 and continuing on to page 5 of Exhibit No. 155:

"Ralph E. Davis, Inc., oil and gas experts of Pittsburgh, Pennsylvania, have prepared a report, dated November 18, 1938, concerning the natural gas reserves from which the company's supply is obtained. Such report follows:

Ralph E. Davis, Inc.
Engineers

Petroleum and Natural Gas
Pittsburgh

November 18, 1938.

Mr. Guy W. Faller, Vice Pres. & General Mgr.
Public Service Company of Colorado,
Denver, Colorado.

Dear Sir:

In response to your request, you are advised that from time to time we have made examinations of the gas reserves of the Texas Panhandle Field, including studies of the properties of all of the principal companies producing natural gas in that territory, as a result of which we are generally familiar with the operations in and the probable ultimate production of the area.

The Panhandle Field comprises more than 1,400,000 proven acres, including sour gas acreage, and has been recently estimated to contain a reserve of more than 15 trillion cubic feet. At the 1937 rate of withdrawal for all purposes this is equivalent to more than a 25-year supply.

The natural gas now being furnished to Public Service Company of Colorado by Colorado Interstate Gas Company is obtained by the latter from its affiliate the Canadian River Gas Company which holds a leading position in the Panhandle Field. We are generally familiar with the location of the acreage there held by the latter company.

While we have made no specific examination of the property and business of the Colorado Interstate Gas Company and Canadian River Gas Company for your account, we are able to state from our own general knowledge that the acreage and gas reserves of the latter are ample to supply the gas requirements of the Public Service Company of Colorado and its subsidiary, Colorado-Wyoming Gas Company, and insure the continuance of this service for at least 20 years.

Very truly yours,

Ralph E. Davis, Inc.
By Alden W. Foster
Vice President.")

1374 *Cross-Examination by Mr. Slaff Resumed.*

Exhibit 158 indicates that during the 12 months' period ended September 30, 1938, Mr. W. Alton Jones was vice president and director of Public Service Company of Colorado. The footnote indicates his remuneration, and that it came from the Cities Service Company. The Cities Service Company is one of the substantial holders of defendants' securities.

From Exhibit No. 160, it appears that Mr. Jones continued as such director and officer until July 13, 1939. Exhibit No. 159 also contains a letter signed by Ralph E. Davis, Inc. by Alden W. Foster, Vice President.

(At this point an extract from Exhibit No. 159 was inserted in the record by the reporter at the direction of the Examiner. This extract sets forth the same letter bearing date of November 18, 1938, as that copied into the record from Exhibit No. 155 at pages 7268 and 7269.)

Yes, I testified on direct examination that the Equitable Life Assurance Society had purchased bonds of Northern Natural Gas Company while I was with the Equitable. That was an issue of $16,000,000 of which Equitable took $4,000,000. I do not know how many of these bonds were outstanding as of the summer of 1939. There were some additional bonds sold and a sinking fund operated on the bonds. I should judge that the amount outstanding as of this summer was probably more, but I would not think a great deal more.

Some additional bonds were issued after the first private deal was arranged. Those were 4¾s that the Equitable bought. The original contract was for 5%, but when the actual deal was closed, the coupon rate was fixed at 4¾%. I have not kept track of the exact amount of these bonds which were outstanding as of the summer of 1939. They had been refunded by the Northern Natural Gas Company. I do not know the amount of the refunding issue. It was somewhere between $10,000,000 and $20,000,000.

Northern Natural engaged in a financing operation very recently. They sold some short term notes. I do not remember the amount of those notes, but should guess that it was between $5,000,000 and $10,000,000.

I think from memory that the maturity date of the bond issue was 15 or 16 years from the date of issue. The purchasers were a slightly different group than the group that bought the original issue. The Metropolitan was one of the large buyers, Equitable and Prudential were others. There were a number of large life insurance companies involved in the deal. Within certain limits, it is usually the case that under such circumstances, the buyers practically set up the terms of the bonds.

The fact that the bonds were issued for a maturity of 15 or 16 years would indicate very definitely that the purchasing companies expect the Northern Natural Gas Company to be in existence well beyond July 1, 1954. I think it is a fair statement to say that they would
1375 expect it to be in existence at least 5 years beyond
1954. I can say definitely upon my own experience with Equitable that they would not buy the bonds unless they were convinced that the operations would go 5 years beyond the maturity of the bonds. Any other estimate would be speculation on my part. When an institution is convinced in its own mind that an enterprise will last 5 years at least beyond the maturity date of certain obligations, it is fair to say that they might have a reasonable expectation that the enterprise will last more than 5 years beyond that maturity date, but it must be remembered that in this instance they were buying mortgage bonds with a maturity in 1954 and with a very heavy sinking fund.

I cannot say what is in the mind of any one of these institutional buyers with reference as to how long the Northern Natural Gas Company is going to be in business. I am confident that they would believe that it is going to be in business 5 years beyond the maturity date of the bonds. I do not think I have anything to add to what I have already said on that point.

In my direct testimony at page 5394 I spoke of the Northern Natural Gas Company as a pipeline. I added that it owns or controls directly or indirectly some substantial distribution facilities. I also testified that at the time Equitable purchased the bonds this circumstance was considered an element of strength. I am not sure that it owns any distribution facilities directly. I think the distribution facilities are owned indirectly through the ownership of wholly-owned subsidiaries. I do not know how many of such subsidiaries there are. I have known the names of these subsidiaries from time to time, but I do not carry them in my mind.

When I said it had "substantial distribution facilities," I meant it received some substantial revenue from those controlled distribution facilities. I do not mean 50% or 25%. I think I would say 10% or something like that. That is my conception of the term "substantial" as I used it there. I think at one time I knew the relationship between the plant account of the subsidiaries and that of the parent Northern Natural. I do not carry the figure in my mind.

The revenues received from the domestic and commercial service for the 12 months ended June 30, 1939, amounted to $1,600,000, and the revenues from industrial sales to about $2,900,000, or a total of about $4,500,000 compared with a total gross of about $10,000,000. That is the amount of revenue received from direct sales as opposed to other sales which are called "town border sales", amounting in the aggregate to about $6,000,000. From this, I draw the conclusion that the subsidiaries are substantial and that substantial revenues are received directly through those substantial controlled by the company.

The total percentage of gas which Northern Natural sold last year to its subsidiaries would be less than 10%. As a matter of fact, it was about 5%. Of course that gas is sold at a different rate than certain other gas is sold.

I have no doubt but that in connection with my general duty of keeping advised as to matters of interest in the public utility financing field, I, or some member of our organization, read the S. E. C. release on the Northern Natural Gas Company.

(At this point, counsel for the Commission requested that Release No. 1667 of the Securities and Exchange Commission under the Holding Company Act in the mat-
1376 ter of Northern Natural Gas Company, be marked for identification. At the direction of the Examiner, the document was marked Exhibit No. 161 for identification.)

Exhibit No. 161 is a regular release of the S. E. C. under the Holding Company Act, containing the findings and opinion of that Commission in the matter of Northern Natural Gas Company. It is in connection with the recent financing operation we have been discussing. In addition to refinancing the existing indebtedness, they were getting some new money, amounting to approximately $6,000,000.

Yes, it appears from the bottom of page 5 and from page 6 of that release, that an informed investor would have learned of the fact that "the company's depreciation problem is fundamentally related to the probable future life of the gas fields from which its sources of supply originate. For such determination, the company employed Ralph E. Davis, Inc., petroleum and natural gas engineers, to undertake a study of the natural gas supply available to its pipeline system from acreage which is owned or covered by purchase contracts as of May 1, 1939". (Objection by Company Counsel overruled.) The informed investor coming across that statement in this release might be interested in finding out what was back of the Commission's statement. Exactly the same answer I have already given applies in that respect. An informed investor could come to Washington or write down for photostatic copies of such documents as might bear on that statement.

(EXHIBIT NO. 161 was offered and received in evidence over the objections of defendants, to whom the Examiner allowed an exception.

The reporter, at the direction of the Examiner, copied into the record the following extract from Exhibit No. 161:

"The Company's depreciation problem is fundamentally related to the probable future life of the gas fields from which its sources of supply originate. For such determination the Company employed Ralph E. Davis, Inc., petroleum and natural gas engineers, to undertake a study of the natural gas supply available to its pipe line system from acreage which is owned or covered by purchase contracts as of May 1, 1939. The report was based upon data furnished by the Company, as well as upon the general familiarity of the firm with the fields and properties gained during previous studies. The conclusions reached were as follows:

(1) The company's position in the Panhandle and Hugoton Fields is such as to assure it, at reasonable cost, of its natural gas requirements, as indicated by present deliveries and with due consideration of the anticipated expansion of its facilities and increased market requirements for a period of more than 25 years.

(2) The properties wno owned by Northern in the Panhandle and Hugoton Fields, together with gas reserves controlled by virtue of gas purchase contracts in these two fields, are in our judgment capable of furnishing this total gas requirement of the Northern system.

(3) The reserves controlled in the Otis Field, while small in total quantity as compared to the reserves controlled in the Amarillo and Hugoton Fields are of importance from an operating standpoint.

The Company's present depreciation policy, 3½% per year or stated in terms of probable life of its plant, 29 years, compares with the Davis estimate of over 25 years for the life of the gas fields."

1377 Counsel for the Commission then produced another document which the Examiner directed the reporter to mark Exhibit No. 162 for identification.)

An informed investor seeking to acquaint himself with what was back of the statement contained in the S. E. C. opinion, now in evidence as Exhibit 161, would find the document marked Exhibit 162 in the public files of the S. E. C.

(Counsel for the Commission then offered EXHIBIT 162 in evidence. The exhibit was received in evidence over the objections of counsel for the defendants, who were allowed an exception.

At the direction of the Examiner, the reporter then copied into the record from Exhibit 162 the following language:

"Ralph E. Davis, Inc.
New York
Engineers 150 Broadway

Petroleum and Natural Gas
1710 Union Bank Building
Pittsburgh

June 1, 1939

Mr. B. R. Bay, President,
Northern Natural Gas Company
Aquila Court Building
Omaha, Nebraska.

Dear Sir:

In accordance with your request we have made a study of the natural gas supply available to the company's pipe line system from acreage which is owned or covered by purchase contracts as of May 1, 1939. Our study is based upon data which have been furnished to us by the company, as well as upon our general familiarity with the fields and properties gained during previous studies.

The company's gas supply is obtained principally from the Panhandle Field of Texas and the Hugoton and Otis Fields of Kansas, as follows:

1378 Gas Requirements and Sales

*M Cubic Feet

	Requirements					
Year	Panhandle	Hugoton	Otis	Other	Total	Sales
1934........	12,338,444	12,502,638	444,265	1,283,030	26,568,377	25,578,650
1935........	13,470,017	12,766,374	4,672,071	1,199,748	32,108,210	31,189,005
1936........	18,123,922	13,396,452	4,402,651	1,201,774	37,124,799	34,872,065
1937........	20,956,418	13,888,741	3,374,564	1,221,641	39,441,364	37,514,817
1938........	22,365,518	13,570,331	3,043,127	1,035,896	40,014,872	39,838,590

* All quantities stated herein are at a base pressure of 16.4 pounds absolute.

During the past three years approximately 90 per cent of these requirements have been purchased from other operators.

Since 1934, the growth in the company's business has been substantial. With the construction of the contemplated new facilities, a further increase in volume of sales has been estimated by the company, as follows:

1379

Year	Estimated Increase in Sales During Year M Cubic Feet	Cumulative Estimated Increase Over 1938 Sales M Cubic Feet
1939..............	3,360,000	3,360,000
1940..............	2,700,000	6,060,000
1941..............	900,000	6,960,000
1942..............	900,000	7,860,000
1943..............	900,000	8,760,000
1944..............	900,000	9,660,000

In the present study we have estimated the gas reserves of the Panhandle Field as of July 1, 1938, this being the latest date when rock pressure data for the entire field are available. Withdrawals during the 2½ years preceding that date and total accumulated withdrawals have been as follows:

1380 Gas Withdrawals from the Panhandle Field.

M Cubic Feet

	Dry Gas				
	Sweet Gas	Sour Gas	Total Dry Gas	Casinghead	Total
Prior to Jan. 1, 1936 (Accumulated)					5,001,052,133*
Jan. 1, 1936 to July 1, 1936	132,861,838	79,248,891	212,110,729	66,822,102	278,932,831
July 1, 1936 to July 1, 1937	238,315,448	160,330,446	398,645,894	132,884,118	531,530,012
July 1, 1937 to July 1, 1938	240,060,100	215,540,850	455,600,960	109,542,946	565,143,896
					6,376,658,872

* Estimate made in 1936.

1381 The accumulated withdrawals prior to 1936 include excessive wastage which occurred upon completion of wells during the early history of the field and also during the period from 1933 until the early part of 1936 when the unrestricted use of dry gas for "stripping" operations was permitted, hence this figure includes a substantial quantity of estimated production. On the whole, the stated accumulated quantity is believed to be conservative.

The rock pressure of the field which initially was 430 pounds had declined by reason of the above withdrawals to an average of 337 pounds as of July 1, 1938. For a number of years we have from time to time prepared estimates of the gas reserves of this field based upon the withdrawals and decline in rock pressure. Based upon our present study the remaining reserves of the field as of July 1, 1938 are estimated to be in excess of 18 trillion cubic feet, which estimate is in line with our previous conclusions.

Recent annual withdrawals for all purposes are less than 600 billion cubic feet, indicating a future life for the field on the basis of present production of approximately 30 years.

The company obtains its requirements from the Panhandle Field under purchase contract with Phillips Petroleum Company (Independent Natural Gas Company), Hagy, Harrington and Marsh, and J. M. Huber Corporation, supplemented by its own wells and acreage.

The Phillips supply is furnished from the residue of six gasoline plants operating on dry and casinghead gas obtained from wells in Gray and Wheeler Counties. Gas processed in these plants during the last half of 1938 averaged 97 million cubic feet per day. After deducting gas used in plant and lease operations, less than half the remainder was required to fulfill deliveries provided in the contract with Northern Natural Gas Company—32 million cubic feet per day or 11 billion cubic feet per year. The balance of the Phillips residue from these plants is sold for carbon black manufacture. Although under the contract, after February 1940, Phillips has the right to reduce its deliveries to Northern, we are of the opinion it will be to Phillips' advantage to continue to make deliveries to Northern even after the present contract has expired, probably for the remaining life of the Panhandle Field.

The properties of Hagy, Harrington and Marsh and J. M. Huber Corporation covered by purchase contract with Northern, and the principal portion of the company's own acreage in this field are located in western Gray and eastern Carson Counties, as follows:

	Carson County	Gray County	Total Acres
Hagy, Harrington and Marsh	21,663	11,577	33,240
J. M. Huber Corpn.	4,280	....	4,280
Northern Natural Gas Company	12,860	5,729	18,589
Total	38,803	17,306	56,109

The purchase contracts and company leases extend for
the life of the production. With exception of ap-
1382 proximately 2,000 acres of Hagy, Harrington and
Marsh leases and 1,100 acres of company leases, the
above is located within the present proven limits of the field. As such, depending on surrounding development and upon the degree of uniformity of reservoir conditions within the general area, it is subject to the rate of depletion experienced by the whole. In 1938 Northern Natural Gas Company's withdrawals from this field were 22.3 billion cubic feet and we anticipate a gradual increase to possibly 25 to 30 billion cubic feet per year.

The acreage and gas reserves controlled by Northern under its own leases and purchase contracts are sufficient to assure this company of its anticipated requirements from this field for a period of more than 25 years. * * *

Ralph E. Davis, Inc.,
By Ralph E. Davis,
President.")

I read the release of the S. E. C. which you have offered here. I did not go down to the S. E. C. and examine any of the documents you have offered from the files of that Commission.

In my direct testimony, page 5405, I testified in substance that a refusal by the S. E. C. to allow a declaration to become effective or to allow the issuance of securities, is a pretty good indication that the securities are not of a quality which should be sold and made available to the public. As a matter of fact, securities subject to the filing of a declaration cannot be sold until the declaration does become effective. That is the kind of securities I was talking about in that answer, those that are subject to the Holding Company Act. Such securities, as to which the S. E. C. has refused to permit a declaration to become effective, cannot be sold under the laws of the United States.

I have stated that I thought that the fact that such applications were approved by the Commission was of substantial influence in the minds of investors in persuading them that securities may be desirable to purchase.

The defendants are not subject to the Public Utility Holding Company Act of 1935. They are not at this time subsidiaries of a registered holding company. Southwestern Development Company is a registered holding company. When I say that Natural Gas Pipeline Company is not a subsidiary of Southwestern Development Company subject to the terms of the Holding Company Act, I mean that there is an application pending for a declaration by the Commission that it is not a subsidiary of that company and I think of some other companies. By that I mean that they are applying for a declaration that they are not subject to the Act. According to the statutory provisions contained in the 1935 Act, defendants, prima facie, would be subject to it.

As far as I can answer your question offhand, I do not think that the subjecting of the electric industry to the regulation of the S. E. C. under the 1935 Act brought any additional risk to investors. It may affect investors over a period of time. I think that, generally speaking, 1383 the statutes under which the S. E. C. operates tend to make available more information to investors and in that sense they get additional protection. It should be remembered, however, that there are certain sections of the Holding Company Act about which there is a great deal of controversy and many people believe that investors may suffer losses. I have in mind particularly Section 11 of the Act.

The same considerations would apply to the segment of the gas industry which is subject to the Securities Act, both the 1935 Act and the 1933 Act.

You have asked me to point out the operating companies and the holding companies listed on page 1 of Exhibit 150. Arkansas-Louisiana Gas Company is an operating company. Columbia Gas and Electric Corporation is a holding company which owns practically 100 per cent of the securities of the subsidiaries. North Penn Gas Company is, I think, an operating and holding company. Panhandle Eastern Pipe Line Company is an operating company. Southern California Gas Company is an operating company. Southern Counties Gas Company is an operating company, and Southern Natural Gas Company is an operating company and holding company.

Considering both defendants as a single enterprise, such enterprise is an operating company.

I have not made any attempt to determine the average yield of the bonds shown on page one of that exhibit. I may have in my office added them up and divided by 8; but I did not consider it proper to attempt to arrive at an average yield in this instance although I have no particular idea at this time why I felt that way; I just did not. I do not know whether the average weighted yield would be of any more significance than the average yield. They would be different.

I do not think it is necessary to a determination of a fair rate of return to have either the weighted or the simple average of these yields. It is easy enough to do it. If I had thought that it was necessary to do so, I would have done it. At the time I prepared the exhibit, I apparently did not think it necessary and therefore did not do it. I do not think it would be helpful to do so. Everything you do provides more information, but I do not think it is necessarily more informative. There might be a tendency towards misleading conceptions.

I did not make any attempt to determine the average yield for the operating companies alone, nor for the holding companies alone. You have asked me to state the Moody's rating and the call price as of September 15, 1939 for each of the bonds shown on page one of Exhibit 150.

Arkansas-Louisiana Gas Company, Moody's rating "A"; callable, 101½.

Columbia Gas and Electric Corporation, rating "Baa"; callable at 104.

Lone Star Gas Corporation, Moody's rating "A"; callable at 105.

North Penn Gas Company, Moody's rating "A"; callable at 104¼.

Panhandle Eastern Pipe Line Company, Moody's rating "A"; callable at 102½.

1384 Southern California Gas Company, Moody's rating "Aaa"; callable at 104.

Southern Counties Gas Company, Moody's rating "Aa"; callable at 101½.

Southern Natural Gas Company, Moody's rating "Baa"; callable at 105.

I testified earlier that I did not purport to be an investment counselor but that I am a financial consultant. It does not appear to me particularly strange, when you know all the facts, that at the time I prepared this exhibit the "Aaa" Southern California Gas Company bonds were selling at a 4.07 yield against a yield of 3.06% on the Lone Star Gas Corporation's debentures rated "A". It often happens that a particular bond with an "Aaa" rating will sell at a higher yield than an "A" rated bond in view of the maturity of the respective issues. In this particular case, the call price of the Southern California bond is 104, and the bond noted here has a price of 106¼. This bond has a yield of 4.07 against the yield of 3.9 on the "A" rated Arkansas-Louisiana Gas Company bonds and as against 3.73 on the "A" rated Panhandle Eastern bonds.

I think these bonds of Southern California Gas Company are of the same mortgage security as the company's 4% bonds maturing in 1965. I think the price of the 4's of 1965 as of 9-15-39 was approximately the same as that of the other bonds. The yield would be smaller. I cannot remember the calculation. It would be 25 or 30 points smaller in basis, or something like that. I do not have right now available the price at September 15, 1939, of the Southern California Gas Company 4's of 1965. From the Commercial and Financial Chronicle of September 16, 1939, which you have just handed me, it appears that the last sale on Friday of that week ending September 15, was 105¾. That would compare with the price of 106¼ shown on my Exhibit 150 for the Southern California 4½'s of '61.

A 4 per cent bond selling at 105⅜ with a maturity of approximately 26 years shows a yield to maturity of approximately 3.65 per cent. That represents a difference of 42 basis points in yield. We have two bonds of the same company, with the same mortgage security, selling on the same day at considerably different yields. I think the yield on the 4 per cent bonds is probably more indicative of the credit of the company. Nobody can tell. It may well be that a person buying the 4½ per cent bonds may obtain a yield to maturity of 4.07 per cent. It may be that buying that bond above the call price may result in a considerably reduced yield. In other words, it would be a yield on short term money if the bonds were called. It is the possibility of a call that keeps the price down and the yield up. Yes, I think the 4 per cent bond of Southern California Gas Company which I did not use in my Exhibit 150 is more indicative of the company's credit, but I was not particularly interested in the company's credit here.

This exhibit here shows yields which are available to investors in different types of natural gas company bonds. It is true a company's credit position in the investment field at large is one of the determining factors of the yield at which its securities can be sold, but here we have a case of where a bond is selling slightly above its call price and it may be that investors will buy that bond and get that yield on maturity. It is of some significance.

It is true that in the preparation of this Exhibit
1385 150, referring specifically to pages 3, 4, and 5, I used
only one issue of those companies which had more than one issue outstanding and I invariably took the issue with the highest yield. I did this because those pages of the exhibit were set up to show that substantial yields were available to investors in other public utility securities. These pages of the exhibit were not introduced to show what yields were in the industry at large. If you will refer to my original statement, I said that the exhibit showed that substantial yields were available to investors both in bonds and preferred stocks of other utility companies.

Yes, I made a conscious choice in selecting that issue of companies having more than one issue outstanding, which had the higher yield. The note at the bottom of each page shows that only one issue of each is included. I do not think I pointed out in my direct testimony that I picked the issue having the higher yield as between two issues of the same company. I did not specifically mention that. On each of those pages there is a note which says "Only one issue of any company is included." The exhibit would not have been substantially different if I had included a number of other issues of each company's bonds like 4½'s and 4¾'s or 5's. It would have made a much longer exhibit and would not have been greatly different in results.

I know a great many of these companies have other issues. I have not made the mechanical computation to determine whether there would be any consequential difference if I had used either all issues of all the companies shown, or issues with the lowest yields.

The yield of 4.07 on the Southern California 4½'s due in '61, is the true yield to the investor if the bond is held to maturity. "Yield" is a well-known term and true yield goes to the maturity of the bond.

This bond is yielding more than the Southern California 4's of '65, which are yielding 3.65, because it is selling a little above its call price. The reason it is selling for only a little above the call price is because that is all the investors are willing to pay for it. They are influenced by the call price. They know what the call price is. That is the factor that I testified before keeps the price down to 106¼ and its yield up to 4.07. The yield at 4.07 includes a factor which takes into consideration that call price. I am not sure that it is fair to say that the yield includes a "premium" on the gamble, or the possibility, that these bonds will be called at their present call price. Certainly the yield of 4.07 is influenced by the fact that the bonds are selling above their call price. If these bonds had no call feature presently they might be selling at almost the identical yield of the 4's of '65. They might vary a little bit because of the difference in maturity.

One way of saying it would be that the difference in yield of some 42 basic points is due to the influence of the call price, and that this difference may be said to represent the investor's premium against the possibility of call. I suppose that is a fair way of stating it, but I do not think it is the way I would describe it.

In the case of the 4's of '65, there is also a call price, but I think those bonds are selling below their call price. They are rated "Aaa", too.

1386 (November 2, 1939.)

In the course of our discussion yesterday I stated that it was my purpose by the information presented on pages 3, 4, and 5 of Exhibit 150 to show the opportunities for investment open to investors. I question whether you can get a better over-all picture by a weighted average than by a simple average. There are all kinds of refinements that might be entered into. Some of these issues have more bonds outstanding than others; but it is uncertain whether a refinement to that extent is of any more value, in my opinion. It is uncertain for the reason that if a company has $50,000,000 of securities outstanding which would yield an investor 7 per cent, and another company has only $5,000,000 of securities outstanding that would yield 6 per cent, the weighted average of that might work out at something around 6.75 per cent, or something like that. I am not sure for the purpose for which this exhibit was prepared that that is any different than showing simply the yields at which the securities of a particular company are selling. As I stated, the purpose was to show investment opportunities to the public at large. The opportunities for investment at given yields or given returns depend upon the amount of that security outstanding and available for investment, but there are sufficient amounts of these securities outstanding.

No, I do not think it would be a better and truer picture in determining over-all averages for the issues shown on pages 3, 4, and 5 of my exhibit to use weighted averages rather than simple averages, which I show at page 4 and which I stated into the record in connection with page 5. ~~This was~~ not built up to show over-all averages. It was built up to show investment opportunities, and I state again that I do not thing I get a better picture of investment opportunities by showing a weighted average instead of a simple average.

The reason I didn't show the investment opportunities available to an investor on the New York Stock Exchange instead of limiting it to the Curb, is that the latter has a wider representation of utility securities than the former. That is, it is wider in types and number of companies. I think this is true when you take into consideration all of the securities on the Curb Exchange and admitted to unlisted trading purposes. I have never made the calculation as to the amount outstanding. I don't know whether the Curb Exchange is wider in the amount outstanding. I have looked at the list on the Stock Exchange from time to time. I have a general knowledge of the listings of domestic electric and gas utility bonds on the New York Stock Exchange at September 15, 1939. I read the New York Times of that date, and I usually glance at the Stock Exchange tabulations of stocks and bonds.

In preparing my exhibit I did not make any effort to get the bonds of electric and gas companies that were traded on the New York Stock Exchange on September 15, 1939, to give me a list comparable to the list contained on pages 3, and 4 of my Exhibit 150. I made up my mind first that the Curb list was a wider list and more indicative for the purpose, and I used the Curb listings. I made no specific effort to find out how much wider or how much more representative the Curb list was. I relied on my general knowledge for that.

Questions by the Examiner.

In answer to your question as to what are the requirements on the Curb that produce that different kind of a range, the New York Stock Exchange requirements are more difficult from the standpoint of information re-
1387 quired to be furnished. It is more expensive for companies to list securities there than it is with the Curb Exchange. A great many smaller utility companies do not even list their securities on the Stock Exchange. The Curb listing is all-inclusive, bonds, preferreds, and commons. I think the representation on the Curb has always been broader in coverage than the Stock Exchange because of the things that I have mentioned, the rather rigid requirements, the amount of information to be furnished to the New York Stock Exchange, and the expense involved.

Cross-Examination by Mr. Slaff Resumed.

It is rather difficult to say that there is a generally better grade of security on the New York Stock Exchange than on the Curb. I just look at page 3 here, and I find one of the very highest grade securities, like the Consolidated Gas of Baltimore. I hesitate to say that the overall grade of the New York Stock Exchange securities is higher. I think I might say it this way, that the securities listed on the Stock Exchange are of a more seasoned character. That is generally the appellation that is given to distinguish the Stock Exchange from the Curb list. I don't know whether the over-all yields on the Stock Exchange list would show a lower yield than the yields on the Curb list shown on pages 3 and 4 of Exhibit 150.

As I count them there are 60 bonds listed on pages 3 and 4. I do not know the exact number of domestic electric and gas companies which have bonds listed on the New York Stock Exchange. I will accept your statement that there are some 65 such companies having approximately 90 issues listed on the New York Stock Exchange. I do not know how many companies had issues traded in on September 15, 1939, on the Stock Exchange. I have not made a calculation to determine that there were approximately 44 or 45 electric and gas companies which had some 60 issues traded in on the Stock Exchange on September 15, 1939. I have a general knowledge of the securities that are listed on the Stock Exchange.

I have not made a calculation to determine the weighted average yield on the bonds of domestic electric and gas companies sold on the Stock Exchange on the date last mentioned as compared with the average yield on the issues sold on the Curb on that date. You have stated that such yield on the Stock Exchange issues sold that day came to 3.63 per cent, as compared with the average yield of 5.12 for the Curb list. I do not think that this Stock Exchange list would more adequately show the investment opportunities open to the investor at large. I say this taking into consideration the purpose for which this exhibit was prepared. This exhibit was prepared to show investment opportunities to investors and to help in forming a judgment as to what might be a proper rate of return for the Natural Gas Pipeline Company of America. Putting in the yields of bonds of such companies as the Commonwealth Edison Company and other very highest grade bonds is no indication whatever of, nor would it be of substantial help in determining, a rate of return for a company of this type. This list was not put in to show all opportunities available to investors. There are countless opportunities available to investors. It simply was put in, as described when it was put in, as a list of securities of utility companies which were traded in on the New York Curb Exchange, a rather wide list, on a particular day; and it must be remembered that

I made the point very early in my testimony that investors were interested in getting the highest yield they could get commensurate with the safety of the bonds. They
1388 weigh safety or hazard against the potential return.

Yes, pages 6 to 15 of that exhibit show a pretty wide range of companies. I think there would be a few natural gas pipeline bonds listed on the New York Stock Exchange, very few. I think of Southern California Gas Company as a pipeline company, but it is really a distribution company and so considered by investors. It has tremendous distribution facilities. That company is one of the companies shown on page 1 of my Exhibit 150 under the caption "Natural Gas Company Bonds." It has two issues listed on the New York Stock Exchange. Southern Natural Gas Company is listed on the New York Stock Exchange. It is a pipeline company which controls companies owning distribution facilities. The Panhandle Eastern is a pipeline. It is listed on the New York Stock Exchange, if my memory is correct. I am not sure of that. Columbia Gas and Electric Corporation has three issues on the New York Stock Exchange. That company is shown on page 1 of my exhibit under the heading "Natural Gas Company Bonds."

In my tabulation on page 1 of Exhibit 150, I show the Columbia Gas and Electric Corporation debenture 5's of 1961. Columbia also has outstanding debenture 5's due April 15, 1952, and debenture 5's due May 1, 1952. They are all 5 per cent securities. They are all the outstanding issues of Columbia. The price of 5's due May, 1952, was 100¼, that of 5's due April 15, 1952, 100, and the 5's due January 15, 1961, 98¼. The ones I picked for my list are the 5's due in 1961 with the price of 98¼. That represents the issue with the highest yield. It is a fact, then, that I picked for inclusion on page 1 of my Exhibit 150, of the three Columbia Gas and Electric issues, the one with the highest yield. There was a choice that the investor might have made between the one with the higher yield and the ones with the lower. He obviously would have bought the one with a higher yield. They were equal debentures. They were all traded in on that day. Some investors apparently wanted to buy a shorter maturity. An investor with a peculiar requirement might buy shorter term securities. "Special" might be a better word to use instead of "peculiar". In explanation of the fact that three securities of the same company with equal security are selling at different yields to investors, I said that it seems to me that the only possible explanation was that the people were buying the shorter maturity and willing to take a lower yield because they wanted a shorter maturity. I think that is the real explanation. It seems to me clear that their willingness to take a lower yield is because they want a shorter maturity; and I think that could be classed as the special requirement of that particular group of investors.

There may be one or more other natural gas company bonds listed on the New York Stock Exchange. Going over my list on pages 3 and 4 of Exhibit 150 I find three natural gas company bonds listed, those of Arkansas-Louisiana Gas Company, Atlanta Gas Light Company, and Southern Counties Gas Company. Atlanta Gas has a lot of distribution. Arkansas-Louisiana and Southern Counties have substantial distribution.

I have not implied that the Curb list was any more representative so far as natural gas companies were concerned than the Stock Exchange list. I do not now say that it is. I have never said it. That was not the purpose of this exhibit.

Redirect Examination Interposed by Mr. Morgan.

Assuming that the Columbia bonds are natural gas bonds, when those three securities were offered on the Stock Exchange on September 15, there was an opportunity to buy bonds with a yield of 3.14. My ex-
1389 hibit was prepared only for the purpose of demonstrating opportunities for investment. This exhibit does not pretend to portray the credit position of any company, but is prepared to show investment opportunities available.

Cross-Examination by Mr. Slaff Resumed.

The list on pages 1 and 2 was selected by me. Page 3 is a list of all securities. I had nothing whatever to do with their selection. Page 1 shows a list of representative companies which to some extent or other are engaged in natural gas operations in varying degree and character.

Referring to the bonds on page 1, you are correct in stating that some of the bonds of Southern Counties Gas Company were selling above the call price. They were selling about 3⅜ above the call. There are several bonds shown on pages 3 and 4 which were selling at or above the call price. The Carolina Power and Light is one of them. Another is the Erie Lighting, selling 2½ points above the call; and still another is the Jersey Central Power and Light, selling 1½ above the call. The company last named has filed a statement with reference to a refunding operation. I don't know how it is going to go. The Kentucky Utilities is selling at call; Louisiana Power and Light at 1¼ points above call; Northwestern Electric at 2¾ points above call; Philadelphia Electric Power Company at 6 points above call; Potomac Edison at 2 points above call; Southern Counties Gas Company at 3⅜ above call; Southwestern Light and Power at call; Texas Power and Light at 1¾ above call. In each of these cases the fact of the pressure of the call price is one of the factors keeping the yield of those bonds up and the price down. It always should be remembered, however, that those bonds are purchasable, and it is entirely possible that an investor will get that particular yield to maturity. He is taking a chance, though he is not taking a chance in the sense that he is taking a gamble, as you say. If they are called, he will get probably a short term money rate on the bonds.

I have a list in my office of the preferred stocks of electric and gas companies listed on the New York Stock Exchange. I have looked at it from time to time, and I have general ideas as to the number listed. I cannot say that I have never made any attempt to determine the number of these securities listed. I did not actually for the purpose of this case add them up. In my mind I did make a specific evaluation of whether the list of preferred electric and gas company stocks on the New York Stock Exchange were just as representative as the list shown on page 5 of preferred stocks on the Curb. I did not add them up. I used my judgment. I did not get out a list of the preferred stocks on the Exchange and look it over as contrasted with that list on page 5. I look at the list every month. I don't think I looked at the list in specific preparation of this Exhibit. I cannot tell you now how the Stock Exchange list of preferred stocks compares with the Curb list on page 5 of Exhibit 150 as to the number of securities or the number of companies. I cannot tell how they compare in amount. I do not know how that list would compare in over-all yield with my list shown on page 5. I cannot tell you approximately in terms of percent. It would be a guess. Since the list of such preferred stocks on the New York Stock Exchange would include such outstanding companies as the Consolidated Edison, with very large amounts of preferred outstanding of high 1390 quality, and companies like the Public Service Corporation of New Jersey, I should judge that the yield on those preferred stocks on the New York Stock Exchange would be lower than the yields on the preferred stocks which are available to investors on the New York Curb Exchange. I would not attempt to say how much lower.

I had to pick a particular time in order to get prices and calculate the yields, and September 15 was the latest date which I found it possible to use in order to be ready to testify in early October. I made no calculation to determine that that was the day of the highest yields in the last several months. I do not know that that is true. I did have this list done early in June in a similar manner and then brought it down to the latest date because I wanted to have the latest date at the time I testified.

When there was no sale of these preferred stocks, we obtained from sources which we considered reliable the bid and asked price. There were instances in my list of preferred stocks on page 5 where no sales took place on September 15, 1939. It is obvious on the face of the document. For instance, "108—109¾" clearly means 108 bid and 109¾ asked. What I did there was to take the entire list and then get the prices on September 15 or the bid and asked prices on that date.

With respect to the bonds on the Curb, as I have stated, all I took were those actually traded in. That was a wide list and seemed to me adequate. The technique or method differed in the two instances necessarily, because I was anxious to get a representative list. My anxiety to get a representative list did not extend to getting the Stock Exchange list and showing the results of those sales. As I have said before, I had previously made up my mind that I had to have some standard, and I selected the Curb standard as being representative, and I stuck to that.

You are now talking about the Census of American listed corporations when you say that when I got into the field of investment opportunity outside of electric and gas companies, I covered the waterfront completely. With reference to that particular thing, I had been with the S. E. C. when that study was started, and I followed it with interest, and I took the study as I found it. I thought it was of substantial interest. I did not cover there what I conceived to be substantially the entire range of American industry. I took it from the S. E. C. They covered it. I included in my exhibit everything that they had put out.

In preparing this exhibit I have tried honestly and fairly to prepare one which would be helpful in determining a proper rate of return. You can characterize it as you may. I considered it a fair and proper presentation. I consider that the lists of securities which I have prepared here were helpful to me in determining my opinion as to the rate of return proper for this company. I suppose you are correct in saying that the only advantage of anything being helpful to me as far as my testimony in this case is concerned, would be in its being helpful to the Federal Power Commission as well. Everything that I have done in preparing these exhibits I consider proper and helpful in determining a proper rate of return for defendants.

At pages 6 to 15 of my exhibit 150 I show rates of return earned on invested capital in various non-utility industries. These rates of return are computed before the income tax. I show an over-all average return, obtained by adding the return in each industry and
1391 dividing by the number of industries, of 9.46 per cent in 1934; 10.02 per cent in 1935; 12.59 per cent in 1936; 12.05 per cent in 1937; and for the period 1934 to 1937, taking into consideration the notes shown on page 6, 11.04 per cent. This last average was arrived at by adding all of the figures [illegible] that last column on page 6 and dividing by the number of lines. I have not made a calculation to show what the over-all figure would be for the years 1931 to 1937, inclusive. In my judgment, taking into account the fact that industrial earnings were generally at a low ebb in the early years of the depression, I believe that figure would be lower than the figure for the period 1934 to 1937. The returns for the year 1938 were lower than they were generally for the year 1937. While I have had no opportunity to check that, it is well known that earnings

in 1938 were below the earnings in 1937, generally speaking. I don't know whether I can say that they were very well below the 1937 returns because I have no idea of the magnitude. I would say that it was probably more than 10 per cent below, but to give it an actual figure I am not prepared. I would not name a specific figure.

I keep up with that sort of thing in my capacity as a financial consultant. I get Standard Statistics in my office regularly. I think I get the Public Utility Service from that institution. Yes, I think it is important, as a financial consultant, to keep advised of rates of return in American industry at large. I receive all the information which I think will be helpful in my business. I don't take all of the services.

I am sure that the falling off in the rate of return for 1938 as compared with 1937 for the companies listed on pages 6 to 15 of my exhibit amounted to at least 10 per cent. I cannot say the exact amount. I am not sure of any amount beyond 10 per cent, in that connection, because I would have to know the actual over-all return in 1938 in order to answer that. It was impossible to obtain comparable figures to this for 1938. It might have been impossible to obtain standard figures accepted generally in our profession for the return on invested capital for the year 1938 on some bases. These statistical services are of many types and include all kinds of calculations. Some particular service may have made some calculations on earnings in 1937 as compared with 1938. I do not know what Standard Statistics has done along that line. I have never investigated it to find out. I think Standard Statistics is a thoroughly reliable source of financial information. It is a well known service. I think their services are on a par with Moody's, Poor's, and the usual standard services in the field. I have said that the returns for 1938, in my judgment, were lower than the returns in 1937. Yes, the average figure for the years 1934 through 1938 would be lower than the average shown for the period 1934 through 1937. I have not actually made the calculations. I am quite sure it would be. Since the returns for 1938 were below those of 1937, it must of necessity follow on that basis that the average for 1934 through 1938 is lower than the average of 1934 through 1937. Also the average for 1931 through 1938 would be lower than the average shown on my Exhibit 150 for the period 1934 through 1937.

No, I never heard of the Cities Service Company investing in the business of general candy and confectionery stores with fountains, nor did I ever hear of any of the other companies who are participants in this project or enterprise investing in that type of enterprise. Other investors have, of course.

1392 I have never studied or made any attempt to evaluate the comparable hazard of this company which we are considering here and the investment therein with the general over-all hazard or risk of the Cities Service system. Cities Service is one of the large stockholders of this company. It is one of the largest. It has in general interests in oil, gas, and electricity. It also owns real estate, I should say. I made no attempt to evaluate the comparative risk or hazard in this business from the point of view of Cities Service when compared with the hazard or risk of the system as a whole. I have no judgment as to these comparative risks without making a study of the Cities Service system. I am not familiar enough with that system to state my opinion as to the relative hazards of the Cities Service widespread system as compared to the Natural Gas Pipeline Company of America. I am consulted by that company with reference to technical matters of certain types. I would not say that I keep in close touch with the affairs of the Cities Service system. I try to keep informed and up to date on the affairs of the Cities Service system on technical matters. I do not pretend to be an oracle with reference to that system. I do not hold myself out as an oracle on all matters. This is a very large field. I do not hold myself out as an oracle in any matters.

Looking at the Cities Service system as a whole and considering that it has large oil interests as well as large gas and large electric interests, I cannot give you any comparative idea of the hazard or the way Cities Service Company, as informed investors, would look at its investment in this enterprise compared to this Company's system of wide investments outside of this. I think I might be able to do that if I had six months or three months to make a study, but the Cities Service system is a widespread organization covering the United States in all kinds of business. I would not attempt offhand to state my opinion as to the relative risks. I did not attempt to do that specifically in my preparation to testify in this case. I have not studied the Cities Service system. In my preparation for this case, I was attempting to determine what would induce an investor to go into an enterprise of this sort for the rate of return. Yes, I knew that one of the investors in defendants was Cities Service Company. I knew the names of the five other investors.

I made no attempt to determine in my mind what the judgment and reaction of those investors would be toward an investment of this sort because I was primarily interested in determining on what basis investors today might be willing to go into an enterprise of this kind. I don't know whether you would call that a hypothetical investor or not. I think it is real. The present owners of this company are the actual investors in this company. There is no other way to characterize them than as actual investors.

I gave consideration to a proper rate of return which might attract investors of any kind to an enterpirse of this kind. I gave no consideration specifically to the rate of return that would attract these actual investors in this project. I know of no way to find that out, and I do not know whether it would have been of any significance to me even if I had found it out. I said in my testimony that I had been in the investment field and had been responsible for the investment of large sums of money for a great many years.

You ask me whether up to the time I left the Securities and Exchange Commission I had ever had any final responsibility for the investment of large sums of money or any sums of money other than my own personal monies.

I don't know whether I can answer that directly.
1393 At the Equitable Life Assurance Society I made recommendations which were presented to the treasurer and the finance committee of the Equitable Life Assurance Society. As to whether I had any final responsibility, I think it is best to be honest. By law in New York State, as you probably well know, the finance committees of insurance companies are the people who have the final responsibility. Before the finance committee, even as far as the Equitable is concerned, the one who had the final responsibility up to that point was the treasurer. In my employments, preceding employment with the

Equitable, I had the responsibility of working with companies in the purchase of utility properties, and to that extent my recommendations might have had an influence. I am referring now to the Carolina Power and Light Company and the Electric Bond and Share. I had no final responsibility for the investment of any sums of money by the Electric Bond and Share system in utility properties. The final responsibility rested with the board of directors. I did have final responsibility for my recommendations. I did not have any final responsibility or any responsibility for the investment of large sums of money for the Central Hudson. While with the S. E. C. I think my recommendations there were possibly of some influence as to what finally happened with reference to the investment of large sums of money. The S. E. C., of course, did not invest any money. As an officer of the S. E. C. I was not responsible for the investment of any sums of money. Since leaving the S. E. C. I have made recommendations with respect to investments, but naturally I have had no final responsibility for the investment of large sums of money.

In making the statement at page 5449 that I had been in the investment field and been responsible for the investment of large sums of money for a great many years, I think the record is perfectly clear without trying to split words in two. I was the engineer in the treasurer's office at the Equitable and responsible for going out and selecting investments of all kinds and character for them in the public utility and in the industrial field. My recommendations were brought in and presented to the treasurer, and we discussed them. Then we took them to the finance committee. In most cases the finance committee approved our recommendations and went ahead and invested during my time there several hundred millions of dollars. I certainly felt responsible for making those recommendations and I caused that company to invest its money on the strength of those recommendations.

I think that on cross-examination I testified that when I was at the Securities and Exchange Commission and determining returns and earnings of power utilities, I was interest principally in the book figures of the company, write-ups, and so on. The statute, you know, requires consideration of the "earning capacity or earning power of the utility assets and securities." In that connection, while we had no direct concern about rate of return, it was a factor that had to be considered.

In the graph at the end of Exhibit 150 I shows the earnings price ratios of twelve operating utility common stocks. One of those twelve companies is the Brooklyn Union Gas Company. I do not have the earnings price ratio for that stock. I had it in my work papers here but I sent them back. You state you have it as 12.77 per cent for January, 1939, as taken off these work papers. That sounds about right. As stated, I do not have my working papers here. If you say that the earnings price ratio of the Southern California Gas Company stock was 8.82 for that same month and that is next to the highest of those shown on the list, I assume it is correct. If it is not correct, I will correct it in my direct examination. You state that 1394 the lowest earnings price ratio for the month of January, 1939, that appears in my working papers is on the Hartford Electric Light Company stock and is 4.68 per cent. That sound reasonable. I made no attempt to determine what the average for the eleven companies, exclusive of the Brooklyn Union, would be or how that would compare with the average for the twelve companies. The twelve companies selected for this thing are twelve of the best known utility operating companies in the country. They are those that were used in the telephone study in exactly the same kind of chart. I used the same companies.

There wasn't anything peculiar as to why the Brooklyn Union, which operates in the Borough of Brooklyn, should be selling at so high a yield above the others when you know the facts. In order to get the average earnings price ratio, I added the twelve earnings price ratios and divided by twelve. I don't know what would have resulted had I added the twelve price earnings ratios rather than the twelve earnings price ratios, divided the total by twelve; and taken the reciprocal of the average. The price earnings ratio of any particular company at any particular time is the reciprocal of the earnings price ratio. I don't know about any mathematical acrobatics. This calculation was made exactly as the Federal Communications Commission studied it. The averages are the same, and the same companies were used except that I left out the telephone companies. I did not think it advisable to determine whether the average of the earnings price ratios would be the same as the reciprocal of the average of the price earnings ratios. I did not attempt to test the validity of my average prices by that statistical process.

Cross-Examination by Mr. Booth.

I have referred to the Federal Communications Commission study. I do not mean to imply that that was a study that had been approved by the Federal Communications Commission. It was a study prepared by a part of the Commission staff. It is available for general examination by the general public or people interested in the Federal Communications Commission merely because it shows that Commissioner Walker approved the report before planographing. I do not understand that there is anything in the report to indicate that it has been approved by the Commission or by Commissioner Walker.

On cross-examination by Mr. Slaff when I referred to recent issues of securities involving pipeline companies which I had agreed that an investor in securities of companies like defendants would probably be interested in, I think I referred to the Northern Natural Gas issue of securities because that, in my memory, is the latest refunding operation wherein securities have been sold to institutional buyers. I don't think I referred to the Colorado Interstate. Yes, Panhandle Eastern Pipe Line Company is one of the large producing and transmission pipeline companies in the country. I am not familiar with all of the details of that company's recently issued common stock. I know that rights were given recently to the then holders of Panhandle common stock to buy something like 80,000 shares of additional stock. That was a rather recent issue. I think the rights were granted to the stockholders, maturing this summer or fall. The informed investor interested in the purchase of securities of these companies if they were issued at the present time would undoubtedly be interested in the information that was filed by the Panhandle Eastern Pipe Line Company with the S. E. C. in connection with this recent issue. The same answer must go for that as went for the other questions with reference to the Public Service Company of Colorado and the Northern Natural. That would be one of the factors because of the relatively few security issues of pipeline and production companies.

1395 (At this point counsel for complaint produced a document described as a certified copy of two pages taken from the registration statement filed with the S.E.C. by Panhandle Eastern Pipe Line Company and requested that it be marked for identification. At the direction of the Examiner the document was marked Exhibit 163 for identification.)

A potential investor in the securities of Panhandle Eastern might well obtain this data from the files of the S.E.C. in evaluating the investment in that company if he were interested in getting data bearing upon the reserves in the Panhandle field. It does not follow anywhere to the same extent that a potential investor in the securities of other large natural gas producing and pipeline companies, such as defendants, would be interested in this data. Information of the kind in this document is directed primarily toward two fields. This company draws from two fields, and the report is directed toward a study of the gas supply of the company in the two fields. The document contains the opinion of Ralph E. Davis as to the approximate amount of gas reserves in the Panhandle field, and to the extent that it goes into detail about that field, anybody interested in the Panhandle field might well use this information.

Redirect Examination Interposed by Mr. Morgan.

I don't think that any investor would take any report of any one geologist as final. He would weigh it and give it consideration. From my experience with an institution, if the geologist's report said the gas supply would be available for twenty years, he would probably never buy the bond for more than a 15-year life. I think I should state in connection with each one of these geological reports or reports on reserves that is qualified through me, if it is, that in forming my opinion as to the rate of return, I made an investigation and reached the conclusion that the life of the field was at least fifteen years. That was sufficient for the purpose I had in mind, in forming an opinion. If I had been going to buy bonds of the specific maturity of any particular company, then I would have wanted to know exactly, in the best way I could obtain the knowledge, how long the field was going to last; but in testifying as to rate of return, I have stated that my rate of return applies after proper amortization, which I assume will be found by the Federal Power Commission. I just wanted to make that clear because a number of these reports have been placed before me, and each time I have been asked whether an informed investor would look at this information; and perhaps there is the implication that in assuming that the life of the field was at least fifteen years, I did not employ due diligence in making the necessary studies I ought to have made in order to arrive at a proper rate of return. I think I did because, as I say, I assumed the life of the field was at least fifteen years, and I assumed that the Federal Power Commission or other body would find the proper amount of amortization, whatever that might be, and my rate of return applies after that amortization.

Cross-Examination Resumed by Mr. Booth.

I am sure I said somewhere in this record that I assumed the life of the field to be at least fifteen years, because I certainly made up my mind with respect to that thing before I even formed my opinion that 8 per cent was a proper rate of return. I had to do something along that line. I am confident, if my memory serves me, that sometime last 1396 week, if not in the direct testimony, I clearly indicated that I assumed at least fifteen years.

As shown at page 5495 I testified in substance that if the organization is set up under regulation on a 15 or a 16-year basis and actually works out to be only a 10 or 12-year proposition, the investor will lose; that there is therefore a risk, and the investor before he goes into the thing will demand some compensation for that risk. I then added that I had included in my 8 per cent, provision for that risk.

(Exhibit 163 was offered and received in evidence, over the objection of defendants, to whom the Examiner allowed an exception.)

1397 JOHN A. COOKE, a witness for defendants, called for further cross-examination, testified:

(November 2, 1939.)

Cross-Examination by Mr. Booth.

I have read my testimony beginning on page 5233 and continuing to about page 5252 of the record. I have no corrections to suggest. There is no substantial change.

There are one or two places where the wording was not clear, just a word here and there, but nothing material, and I do not think it detracts from or varies the evidence.

I have stated that I am a partner in the firm of Peat, Marwick, Mitchell & Co., a partnership. We have been in practice, I believe, since about 1897 and have done professional accounting work continuously since that time, particularly in this country, and of course abroad; but our headquarters are in this country. We have a number of offices scattered geographically throughout the country. Our clientele includes all kinds of firms, including industrial and public utility concerns. We do skilled and professional accounting work to the point that we will undertake any type of professional accounting service.

"Sinking fund" is a very common occurrence in industrial and financial set-ups. It is not an unusual occurrence as far as the companies which our firm has represented are concerned. You ask for the difference between a sinking fund and a depreciation and depletion fund. A sinking fund is usually to take care of a repayment at the end of a period. A depreciation fund is one set aside to take care of the wear and tear or other factors which may enter into the usefulness of a particular piece of property. Usually a sinking fund is to pay off debt obligations. That is the general description of it. A depreciation and depletion fund is designed to recover the amount of loss due to wear and tear and other factors.

As to the distinction between a sinking fund and a sinking fund reserve, a sinking fund is the actual fund or the payment of the money representing the sinking fund reserve. The fund is the asset, cash and securities. The reserve may not necessarily be set aside out of the business. The reserve is not surplus as the term "surplus" is generally used. The reserve is a segregation or an appropriation from surplus or earnings. I would not say that the sinking fund reserve is normally earmarked surplus. I would not describe a sinking fund reserve as surplus. Surplus indicates what is available for dividends. A reserve fund is a distinct statement of whatever is in that account and is not available for dividends. That is why it is set up as a reserve. It is not available for dividends because you have appropriated it for some other purpose, namely the purpose of the reserve, which is whatever may be described in the resolution, or may have been in the minds of the officers when it was set up or set aside. If it is a sinking fund reserve designed to pay off debt obligations, it is an amount set aside, not in money but on the books, preventing the distribution from surplus of earnings to the extent of the reserve fund. When the sinking fund is used to pay off debt obligations, the reserve goes into the equity for the security holders, naturally, which is the surplus.

1398 You ask for the distinction between a sinking fund reserve and depreciation or depletion reserve. My answer is similar to that already stated. The sinking fund reserve is set up on the books as a reserve against capital or an obligation of repayment of the capital—I am speaking now of the bonds as well as the stock. It may be in one of these preferred stocks or bonds or some other obligation. It is earmarked surplus. To be a reserve, it is earned surplus. A depreciation reserve is similarly surplus earmarked, but it is carried against the particular asset as a reserve for the loss of use, partially or wholly, of the asset as distinct from what I have said is a sinking fund. The general idea of the depreciation and depletion reserve is that it represents the estimated loss of the value of the property. It is not really surplus until it has been found that there is no need for it.

Amortization as applied to property values is merely the accrual over a period of years or over any period by a definite policy of annual amounts that usually in the sinking fund arrangements are the same. Depreciation is something that may fluctuate from year to year according to the use of the equipment or other factors. To answer your question specifically, the cases in which I would recommend amortization rather than depreciation would be where there is a fixed term of life of those assets, and where the assets depend on exhaustible resources, either property or other assets. It may be reserves in this particular case where I presume you have a question of gas or oil reserves.

You ask whether I would recommend setting up an amortization reserve to amortize the plant investment of a company in place of a depreciation and depletion reserve, when by the action of depletion the property would become useless, even though it has many years of physical life left. There are two factors there. You have the one factor that is exhausted and the other factor that is not. Then before we can make a decision, you must consider further whether that which has a life which is not exhaustible can be used after the exhausted life of the other factor, to determine whether or not you must cover the whole of the lesser exhaustible asset in the shorter life of the asset which will be exhausted sooner. Whether you call it amortization or depletion is immaterial from my point of view as long as you set up a reserve to recover your investment by the time that one or the other of the factors have exhausted the usefulness. Such an amortization reserve could never be less than the proper depreciation and depletion reserve if it was to accomplish the same purpose. Whether you call it amortization or depletion, if it has to meet a certain purpose, it must meet that purpose at the end of the term.

The depreciation and depletion reserve is based on the estimated physical life of the property, less any salvage value that there may be at the end. The amortization reserve is not based upon the useful life of the property in that sense. You are amortizing your expenditure for the purchase or building or the acquisition of an asset. To show the difference between them, probably a word of explanation is in order. If you apply the depreciation reserve, and in that allow for a salvage value at the end if it has a salvage value, then your reserve is built up to meet that difference between original cost and salvage. Amortization or depletion presumes that there is not a salvage value in the particular asset and you are spreading all your cost over the useful life of it. I did not make a positive statement that the amortization reserve means that there can be no salvage
value. I did not infer that there is no salvage value
1399 there, but I say that as the term is usually used, it
has for its object recovering a certain fixed amount for one purpose or another at the end of a life or a term of years.

You have asked me to assume that a pipeline which was built in 1931 has a physical life of 35 years, but the field which it serves will be completely exhausted in 1954, and the line must then be dismantled and junked. Then you ask what would be the minimum basis of computing the reserve that I would use in certifying to the balance sheet for December 31, 1938. I do not know that I could answer that question specifically with the minimum number of years. I should say that I would be influenced by the 1954 year, which is the year which you advise me the reserves or the base on which the particular business is built, would be exhausted. I would recommend a base which would take care of the investment in the lesser of the two periods.

As to what weight I would give to an engineering study of observed depreciation of 5 per cent of the book value of the assets having a physical life of 35 years, 8 of which have expired, but which serves a field which will be completely exhausted in 16 more years, I would give considerable weight to any engineering estimate of depreciation, because I am not in a position myself to determine the depreciation rate. Therefore, I must rely on others. I would be influenced by the engineering study of observed depreciation in certifying to the balance sheet of such company, yes, because an engineer is in a better position to know what the depreciation factor is in an industry than any accountant. I am only an accountant. If I assume that the company would possibly go out of business in a lesser period than the 5 per cent permits, then I say that I would probably question the adequacy of a 5 per cent rate. Assuming that at the end of 8 years I am advised by the company that due to exhaustion of reserves that must go out of business in 16 more years, though there is a physical life of 35 years of the property, and further assuming that I had before me this engineering study that the observed depreciation is 5 per cent, I would certainly recommend that the depreciation be such as would wipe out the investment in the remaining 16 years. I would say that if 8 of the 24 years of the company's life have already expired, it would be reasonable to set up a reserve of one-third of the investment by the end of the eighth year, that is, presuming they had started depreciation in the first year.

I would give weight to any information in an examination of the company's accounts. (Objection by Company Counsel overruled.) Naturally it would not be confined to an engineering report if I had any other factors available to me. I would take the whole scope of the information available only for one purpose, not in determining or recommending a depreciation rate or amount—I am not qualified to do that—but merely to see that there had been a recognition of the principle of providing for depreciation.

As to whether I would give recognition, in the light of what we have heretofore discussed, to the fact that one-third of the life of the project has passed, that would only be one of many factors, and even that might not be of any guidance. It may not be the important factor. For instance, a company might start up one year with $100,000 of equipment and depreciate for eight years at say 5 per cent. The reserve would be 40 per cent of what $100,000; but if in the meantime it had spent a year before $1,000,000, your reserve is absolutely out of all proportion to any basis of the

term of years. Even if it be assumed that the property would remain fixed or substantially fixed, and would be the same at the end of the 8-year period as at the beginning, we must bring other factors in. I must know, for instance, to form any opinion at all, whether it is all in one class of investment, whether some of it is an item, as for in-
1400 stance, capital in the form of land, which does not have any depreciation ordinarily on a normal company's books. You may have some intangibles in there.

Assuming that the land and the intangibles constitute a very minor part of the company's investment, if the assets are all of one class and the information is put before me that the company is taking a 5 per cent rate, I am not in position to say it is insufficient, if it appears to me that that is providing a reserve which recognizes the principles of depreciation on that basis. Then I would expect at the end of the eight years to have about one-third of the asset value reserved for, that is one-third of the net asest value after deducting the salvage value.

I recall the question with the assumption of the values and the rates which appears at page 5235 of the record. I recall generally what the answer was. The first assumption contained in the question was that defendants have a maximum life of 16 years. As to whether I assumed that the gas fields were being depleted year by year in this period, I assumed nothing more than the 16-year life. I did not assume any distinction as to year by year, but merely a 16-year period over which I was calculating this fund for return to the equity holders of their value. In a general way I assumed that part of the gas fields was going out each year, but I did not go through any process of assuming it. I merely assumed that at the beginning of 16 years it was there, and at the end of 16 years it was not there. How it went in between I have no knowledge of, nor did I even use any such information in my assumption. I did not take the trouble to make an assumption that the pipeline and other equipment was depreciating year by year during that period, because I was not concerned with the principle of depreciation in my calculation. The assumption given to me was in effect that the pipeline and other equipment would be completely worn out at the end of 16 years. I did not consider the question of the pipeline and other equipment being worth only salvage value at the end of the 16 years because the gas field was exhausted. I assumed merely an investment there that actually covered over the 16 years. The dtail of how it was made up or the basis of annual exhaustion were never even considered or thought of in the assumption on which I based the calculation.

Inasmuch as it had nothing to do with my assumption, I did not give any consideration to what the company was recording on its books for depreciation and depletion expense or whether it was setting up an adequate reserve for the ultimate retirement of the pipeline and other equipment.

The second assumption was that the proper rate base on which these companies are entitled to earn is $75,000,000. I did not go through any process of year by year estimates or assumptions of value, but assumed that over the 16-year period from the beginning to the end the investment was $75,000,000. That was the sum which was required to be restored, the property value that was required to be returned or obtained for the benefit of the security holders. This $75,000,000 rate base was the complete property value. I did not assume that this amount was reduced annually by the amount of depreciation and depletion.

The third assumption was that the proper annual return is 8 per cent of that rate base. I could only assume; I could not say it was proper. I took "return" to mean net
1401 income before depreciation and depletion for the reason that we are dealing with the return on the property value. I understood "return" to be before the deduction of interest for bonds.

Passing to the fourth assumption to the effect that in order to distribute the burden of returning to the investors the capital or the amount of the rate base, a fund is to be set up in equal annual installments over a period of 16 years, I assumed the investors to mean the security holders, being those to whom the property value would be ultimately returned. They include the stockholders and the bondholders, all the security holders. I don't know whether there is a distinction between capital and rate base. That is getting beyond my realm. By the words "in order to distribute the burden of returning to the investors the capital or the amount of the rate base," I was thinking of the property value. Call it capital, or call it whatever you like, it is the value that you set up, and I believe capital was the term that was used in the question which led me to the question of rate base.

You ask me how depreciation reserves should be handled on the books of the company if the rate base is larger than the capital. That would be confusing two items. You are confusing something which is not on the books with something which is on the books? The two things are not the same and, therefore, I cannot answer that. I assumed that the fund to be set up on the books would be a sinking fund, the purpose of which would be to provide the amount of money required at the end of the period to restore to the security holders the value which the Commission may say they are entitled to.

Questions by the Examiner.

Mr. Booth asks me if I think that prudent management would choose to invest such a fund in riskless securities bearing 1.35% interest or to use such a fund to retire outstanding bonds bearing 6% interest which are callable at par if it had such bonds outstanding. That is not the type of question ordinarily asked of me in my line of experience, because I am not an investment counselor and would not presume to advise on investments. I do not necessarily consult investment counselors on such questions as those counsel has been asking me when I arrange or analyze the books of a corporation. The company would be the one making the investment. If they had the money to invest, they would consult the investment counselor. The question directed to me is not the type of question on which I would get information, either from the counselor directly or through the company, any more than any man in the street may be asked his advice on whether one thing is more prudent than another. I hate to claim any ability to advise anybody where they should put their money.

Cross-Examination Resumed by Mr. Booth.

Without claiming to be an authority, or, as is commonly called, an expert on advice of this character, if a corporation can get 6 per cent, whether it is on its own bonds or on others, rather than 1.35, I think it would be well advised to make such investment. If it did that through the retiring of its own bonds, and it had to make up the difference in the sinking fund representing that 6 per cent then it would not have sufficient in the fund at the end to give it both the property value and the earnings. If the reserve or that amount carried to the reserve be used to purchase the company's own bonds, there would not be that fund there in this full amount at the end of the term. I testified before on that, and in making my answer I am assuming that that is being considered. The statement has now been overlooked by Mr. Booth, but I did make that statement before regarding the lack of full fund at the end if it was invested in the company's own bonds at 6 per cent.

I assumed that the return referred to in the question originally asked me on direct examination was before interest. The rate of return as I understand it in a case of this kind is on the property value, such property value representing the property of the security holders, either in whole or in part, of one kind or another, so that if any lesser amount is paid to the one, the difference becomes payable to the other; and therefore, any reduction in interest paid to the bondholders is included in whatever per cent may be left
1402 for the stockholders and is not a saving. It is merely
a transfer. That is why I asked you to determine what you mean by "saving." It may be a saving in interest, in the sense of the word "interest"; but it is not a saving in the amount paid to the security holders pursuant to their rights.

I believe some companies now engaged in an extractive industry pay liquidating dividends on their outstanding common stock out of the depletion reserve. I could not name any companies which have. The very term "liquidating dividends" indicates payment out of reserves rather than out of earnings.

Going to the fifth assumption in Judge Morgan's question to me, to the effect that these companies have bonds outstanding which bear 6 per cent interest, I understand that assumption to mean that the bonds were outstanding against part of the $75,000,000 rate base. I understood that the interest on those bonds was to come out of the 8 per cent return. I had no particular kind of bonds in mind in formulating my answer. I did not assume that the bonds were non-callable or callable only at high premiums. I did not assume that the bonds were callable for sinking fund purposes at par. I merely assumed that there was a value of $75,000,000 to be returned over the period; that the fund was to be built up to the $75,000,000 at the end of the 16 years. I did not go into consideration of where the company is going to get the money to redeem the outstanding bonds which are callable for sinking fund purposes. They might get it from one place or another. If they have not got it in whatever return is allowed, they would have to do some financing of one kind or another, borrow the money to pay it, or go into default. I don't know. I have not gone into that with the idea of determining the policy.

I assumed generally that the $75,000,000 rate base was to prevail during the entire 16-year period. I made that assumption merely for the purpose of making the calculation. If the property is going to terminate or die in 16 years, under normal circumstances I think it would go down in value. It is in very rare cases that it would not. I assumed a $75,000,000 rate base to prevail during the entire 16 years merely because that assumption had been made as the basis of the calculation. I did not make the assumption. The assumption was given to me, I believe, in the question, and on that assumption I made a calculation. No, the question was not so long that before he got to the end of it I forgot the first assumption. The maximum life was assumed to be 16 years, and I figured on 16 years. However, the principle which I was intending to illustrate does not vary whether it is 16 or 14 or 10 or 20.

I did not assume that the mortgage indenture required the bonds to be paid off in specific amounts on specific dates faster than the fund accumulates. I believe in my testimony I said I was assuming that the bonds could be retired as they were needed, that is, that the company or the trustee, from the sinking fund, could make such investments as were required. I would not be in a position to answer your question as to the conditions under which the management invests its sinking fund in securities other than by retiring the debt of the company. If you have a sinking fund trustee, the trustee has the right to determine what investments you shall make. I can't answer your question as to what companies in my experience have invested their sinking
1403 fund in securities instead of paying off their debts. I
do not recall any mortgage or other instrument under which debt obligations are now outstanding which provide for a sinking fund which is not to be used to retire outstanding debts. There might be such indentures, but I do not recall any. Many companies have indentures for the retirement of their bonded or other indebtedness, maybe for preferred stock. That indenture provides for setting aside sums of money determined by various means. In many of those, and I will say a large number of them, the purpose is not to build the fund to the end of the whole term, as in this case, $75,000,000 at the end of 16 years, but is to permit them as they go along to use that money to redeem their indebtedness, in which case the trustee may at

his option use the money to retire that indebtedness, or he could hold the money until such time as the whole obligation matures. That is a sinking fund created for the purpose of paying the debt. That is the usual and ordinary industrial situation. That is the way most businesses hope to pay off their investors. They can pay off the prior obligations and at the earliest possible date get down to the equity left for the common stockholders.

You ask me under what conditions I would expect the management to invest its sinking fund in government bonds with a yield of 1.35 per cent instead of retiring its outstanding bonds, which pay 6 per cent interest and are callable at bar. (Objection by Company Counsel overruled.) I can make an answer, of course, but I don't know whether I am a competent person to make it in an important hearing of this kind. I have not been a trustee under any sinking fund. I have testified on the use made of sinking funds as I have found them or as the accounting profession finds them in the industrial field or in the field of business. I will answer that question in this way: If the company may have a need for cash, the liquidity of government bonds would be a factor that it should recognize, whereas investing the fund in its own bonds would not give it that liquidity which it might need in a moment of emergency. That would apply for whatever purpose it might need its funds and for which it would be permissible to use it. Generally speaking, the sinking fund is used only for the retirement of the debt or investment in the property. I am speaking, of course, of the sinking fund for the retirement of indebtedness of utility companies which comes into question and which we were discussing.

With reference to the $10,000,000 that, it was assumed, will be required for the purpose of additional property, as opposed to replacing property, for use in the operations of the company, I did not assume that that amount was in the rate base because that would bring in a factor wherein I would have to decide a changing rate of accrual. For instance, this is based on 16 years, and I assumed 16 years. I also assumed 8 per cent return and the value of $75,000,000. If I am going to bring $10,000,000 more into the property value, then if it does not come in at the beginning, which would make it $85,000,000 to start with, it would have to come in at some time during the period, and it would stagger the amount that would have to be put in each year as the additions are made. That would increase the amount put into the sinking fund each year and would make a complicated calculation, which I did not think was necessary to introduce for the purpose of the illustration.

I ignored the factor of depreciation because we were not considering depreciation. We were considering the recovery of the total value, regardless of how it was amortized, depreciated, or depleted. I eliminated that $10,000,000 from the question entirely. The $75,000,000 1404 I considered was the property value on which the assumed rate and the assumed rental was based, and I believe I merely used the whole figure as an illustration. The introduction of $10,000,000 additional would not change my illustration materially. It might do it figuratively, but it would not change the principle that I was endeavoring to establish. No, I did not assume that the 8 per cent would return to the investor his capital. I understood and assumed the 8 per cent was a return to which he was entitled on the property value over the period. In fact, I believe that it was distinctly stated there in the evidence that it was assumed that the security holders were entitled to the $75,000,000 plus 8 per cent return on that value for 16 years; and I believe that the figure that would be mentioned would be $96,000,000 as earnings return over the period in addition to the $75,000,000 property value return. I don't think I even recognized the assumption that $10,000,000 would come from the fund Mr. Morgan asked me to assume would be established in my calculation. In continuing corporations the fund might be used for supplying the $10,000,000, but not where a company would have a limited life.

Referring to the seventh assumption that "1.35 per cent is the rate of interest which will be received by an investor in government bonds, which are the most nearly risk-free of any securities available for the investment of a trust fund," you ask me which is more risk-free in returning the money to the security holder or investing it in Government bonds, I think the government bonds are considered to be the most risk-free of all. Let me answer the question this way: If you could return all the money at one time to the investor, then obviously, as far as that investor is concerned, there is no risk any longer. He has got his money back. As to why you have to hold the funds if you have it instead of returning it to the security holders, there are a number of factors involved there. The primary consideration of a return of the money would seem to be that you have got it and therefore there is no further problem about it; but the trustee can hold that money in government securities which have the least fluctuation, and when eventually he has to redeem, he can liquidate them for the purpose of paying the obligation. That is what one has in mind when you speak of investing, although I am not an investment expert, as I told you. If the trustee holds the fund in government securities, at least we will presume that the government securities are good or are going to be good. If everything else fails, that will be the last. If you pay it back to the bondholder, then he is faced with the problem of investing it himself.

Yes, the company's responsibility is concluded when it returns the whole amount to the security holder. If any portion of the whole be returned to the security holder, the company's responsibility is then at an end with respect to that portion, if you can segregate the rights and obligations under a portion. So far as it has turned the money over to the trustee under the terms of the mortgage indenture, the company's responsibility is concluded. Then the trustee, as an individual, is the one who determines or decides what bonds are retired in carrying out those terms of the indenture. What I am trying to bring out is this: Bonds are very, very seldom, if at all, retired 5 per cent for each bondholder. They call certain bonds, and therefore those particular bondholders get their money out. There can be no question as to them when the particular bond is called and paid off. The remaining bondholders, however, do not. They are still outstanding. Then if you work on that basis, assume that at the end, through some catastrophe which might appear during the last two years say, your property or your operating facilities are destroyed and you have no means of restoring earnings or revenue, the remaining bondholders are likely to lose their equity.

Therefore, over all, the situation of this last batch 1405 not getting theirs or any part of theirs because they were the last bonds to be called, gives them a total loss, where as if you had it invested outside by the trustee in government securities or, if there were any, in safer investments than that, then it would be there and would be liquidatable, and they could sell those and with the money they would pay proportionately all the bondholders the percentage which the funds they have bear to the total. Those bondholders, who, by retiring the company's own bonds, might have lost everything, lose only 5 per cent. If you can eliminate the individual bond element, I mean if you have a million dollars worth of bonds in $1,000 bonds and you retire a thousand bonds, all of the particular companies, if you have six, may have had part of their bonds called and paid off. If you have six bondholders and they are paid back year by year in proportion to the amount which they hold, then my answer would not apply. If all the bondholders have been paid off, the only circumstance which could interfere with the payment of liquidating dividends would be the question of availability of cash to do it with. I am not entering into the question whether it is good judgment to do it or anything about that at all, because I am not in a position to so express an opinion. I do not know what I would do. I would wait until I got there and then I would decide.

You ask under what conditions would I say it is proper for a company to accumulate a fund of $75,000,000 over a period of 16 years to pay off the security holders at the end of that period. (Objection by Company Counsel overruled.) I cannot answer the question. I am not in a position to know. I have not given that any consideration. I was not concerned in my calculation whether it would be paid off piecemeal or at the end in one lump sum. The calculation which was made was on the basis of having the sum at the end of 16 years in total, and gives the lowest amount to be put in annually in the way of a sinking fund to build up that figure. If you pay it off every year in the proportionate amount, you are going to have to set aside a larger amount every year. Then you would be disturbing your compound interest factor. If you are going to pay it off, or can pay it off, piecemeal, the question of government bonds does not even come into the picture because you can retire your bonds. So my calculation on the amount at the end of the period, regardless of whether there be any merit at all to it, was in favor of the lower amount of sinking fund sum per year to be recovered at the presumed rate that you wish.

You have asked whether, as far as I am concerned, I am able to state any circumstances under which it would be proper to set up a fund which would accumulate $75,000,000 at the end of 16 years. I can only say as regards that that the only circumstance that could require the accumulation of the fund at the end of that period would be some provision inherent in the agreement or in a decision which the company would be ordered to abide by. There is no general condition which says any fund shall be handled one way or the other. So far as my general accounting theory may be applied, it presumes, in the absence of a method to take care of redeeming the investment earlier, that it will be provided by the end of the period. My previous answer is also an answer to be considered in connection with the one I have just stated. I believe each was a statement of a different situation or an attempt to give a clear answer to the question.

You ask what would be the comparative effect on the stockholder if on the one hand the company invested the sinking fund in government securities at 1.35 per cent, and on the other hand retired from time to time 1406 bonds which carried 6 per cent interest. The difference would be that the sinking fund built on the basis of investment in 1.35 government securities would mean the accrual in the sinking fund of the interest which would be derived from those investments. In that particular case it is also presumed that the bonds remain outstanding, in which case the company goes on paying 6 per cent to the bondholders in accordance with the terms of the bonds.

In answering the second section of that question, if the money is used to retire the bonds, there is no money coming in in the form of interest from outside securities to help build up that sinking fund, and the fund would receive 6 per cent bonds of the company. In that particular case the company would go on paying the bondholders their 6 per cent, and the payments so made would be divided. A portion of it would go under that arrangement into the sinking fund. It would go to the trustee, and the trustee would then pay out the interest on the bonds which had not been retired or brought into the fund, and the interest on the bonds which were in the fund, as they have not been cancelled, would accrue in the fund.

The fund would get the 6 per cent interest under the obligation of the indenture. That 6 per cent would come out of the earnings return, that is, out of the 8 per cent return which we have assumed.

In my testimony shown at page 5241, I stated in substance that taking the assumptions to which we have already referred, provision can be made on an equal installment basis for the amount to be returned, through the accumulation of a sinking fund. I did not mean that provision must be made in that manner. The statement is clear in itself. It can be accumulated through a sinking fund. You ask if there is any other way of doing it. Yes. When I said it can be accumulated through a sinking fund, I meant something that is outside the company's control, so that when the money goes in there the company cannot get it back. The other method is by holding it themselves and making themselves trustee. It can be done that way, but I doubt whether you will find any cases where the bondholders will permit the company to so hold it. That is why I said that it would give the same result. I meant the money is either with the trustee to accumulate, or the other method I had in mind of the company's accumulating it itself.

Under certain circumstances it might be paid off partially and piecemeal by retiring bonds. I hate to add "and stock" as you suggest. After all, it is not the proper thing to do for a company to pay off its stockholders in any form or other until prior obligations have been taken care of. As to whether it could be done after the bondholders are taken care of is an open question, for the simple reason that when you get down to the stockholders, they are the owners of the business. When they come to the time they are paid off, there is no business. There is nobody to operate it, and therefore they will just carry on with the investment until the purpose of their business is terminated for one reason or another. On the basis of the business ending in 16 years, you would take care of the whole thing over that period. I have not gone into the mechanics of how that can be done, but naturally your prior obligations come first.

I do not think the question of what the amount of the bonds is has any bearing on where the interest has
1407 to come from. You ask me under what conditions
must the interest come from outside the company if the company has at the beginning of the period approximately $60,000,000 in bonds bearing 6 per cent interest, callable at par for sinking fund purposes. As-

suming that you mean the interest on the sinking fund, the answer is this: it must come from outside if the company is not to have its return, based on some agreed rate or determined rate, impaired either during one year or any time during the 16 years, or the whole period, I should say. You ask me to assume that the $60,000,000 in bonds were in fact paid off, and then ask whether the bondholders would, under my notion, be entitled to the full 8 per cent on the $75,000,000 which I assumed was the so-called rate base which prevailed throughout the period. The only answer I can give you on that is that I cannot answer what they are entitled to. That was an assumption in my calculation. The very reason for assuming it was that I had no means of knowing what figures or amounts would be ultimately determined.

Going back to the question which Judge Morgan addressed to me and which contained those eight assumptions, if the assumptions were different, to the extent of the difference in the assumptions obviously my answers would be different. If, instead of $75,000,000 over a 16-year period, that assumption were changed to a decreasing amount, then the assumption would be different and the figures that we gave or the conclusions would be different. The principle however, which I set forth would not necessarily change. The mere changing of the value from $75,000,000 to $60,000,000, or up to $100,000,000, would not change the principle I was trying to illustrate. You see, if I may further explain, I was not considering the depreciation factor in my calculation. I was working on the assumption given to me that $75,000,000 was the value that might be established one way or another. It had not been established. That is something that was open to discussion and was to be established by the Commission at a later date. I was not intending to infer from the mere fact that it was $75,000,000 that the principles would be different than if the figure were $60,000,000.

You ask me if I assumed that the return was to go to the security holders and no part of it could be diverted to the sinking fund. Up to the point of your saying "diverted to the sinking fund" I was with you, but that rather confused it, and I am just wondering what bearing that has on the picture. The assumption was that $75,000,000 was to be returned plus the 8 per cent over the 16 years on the $75,000,000, which was $96,000,000. If any part of the earnings went to the sinking fund—by earnings I mean this

$96,000,000—there would be a depletion of that assumed 8 per cent return to the security holders.

You asked me if the sinking fund could earn the return of 8 per cent if it were proper to divert part of this return to the sinking fund by having the sinking fund acquire the securities or bonds of the company. I don't see how even by implication 8 per cent could be paid to the fund if the bonds are 6 per cent. I previously stated that if the bonds go into the fund, then as long as they are outstanding this interest must be paid on them where they are. The bonds earn 6 per cent. The fund does not earn 6 per cent, as there may be other monies in the fund not earning 6 per cent. If the bonds make up the entire fund, then your statement would be correct that the funds, which are the bonds, earn 6 per cent. You ask me if the fund would probably earn more than 6 per cent and probably 8 per cent if the fund acquires a pro rata share of both bonds and 1408 stock. I cannot answer that. It would be rather unusual to find any sinking fund acquiring stock of the corporation which still has bonds outstanding for which the fund is created. I did not stop to tell Judge Morgan that those were not real practical assumptions which confronted me every day in the business world. I accepted the assumptions and worked out the answer. Certainly I was not vouching for the accuracy of any of those assumptions. As to whether or not those assumptions were such as I met in my business experience, that never entered into my consideration.

Going back to your question, I could not answer that without being given the amount of the bonds held and the amount of the stock and the earnings that were available to pay on them. This is what is confusing me in answering: If you have bonds in there and stock which are a part of the securities of the security holders, and in the year you pay 6 per cent on the bonds, then there is only 2 per cent or a fraction thereof, depending upon the excess of earnings over the interest requirements of the bonds, which is available for the stockholders' dividends. It might be less than 6 per cent or it might be more. If it were more, then the average going into the fund would be higher. If it were less, the average would be less than 6 per cent. Naturally, if the sinking fund had a certain amount of dollars available to go into the sinking fund each year, and if those dollars were translated into securities of the company, to-wit bonds and stock in proportion, that fund would then earn 8 per cent, assuming that the company is earning an over-all return of 8 per cent.

(At this point counsel for the Commission produced three documents consisting of excerpts from the testimony of defendant's witness Emery given in a prior case, one described as beginning with a page numbered 2377 and extending to page 2406, another described as a 4-page document beginning with a page numbered 2444, and another a 3-page document beginning with page 3033, and asked that these documents be marked for identification. The three documents above referred to were, at the direction of the Examiner, marked as Exhibits 164, 165, and 166 for identification. The Examiner ruled that Exhibits 164, 165, and 166 were not admissible in evidence and awarded counsel for each of the commissions an exception.)

1409 J. A. EMERY, a witness for defendants, recalled for cross-examination, testified:

(November 3, 1939.)

I would like to offer a correction to my testimony of last week in the cross-examination. I was asked if I had made any calculation of rate of return for this case following the methods that I used in the 1934 testimony. I replied that I had done so by one method or following generally one method. Since that hearing I have come across an attempt to make a calculation by one other method, but it was preliminary and incomplete.

Also I would like to state that in my direct testimony the Examiner questioned me regarding the cost of a conventional pipeline and I was not able to reply. I have since had made under my direction an estimate of the important items of variation between the present line and such a conventional line, and have prepared an addendum or supplement to Exhibit 149 setting that forth, together with my estimate of the increase in earnings due to the unusual load factor or capacity factor at which this company operates.

Also there is at least one correction that I would like to make in my going concern testimony; but I understand that should be made at the time that testimony is taken up. I would like to say that I have not read the cross-examination testimony and may have some corrections that I would like to ask to be made.

Cross-Examination by Mr. Slaff.

I testified in the Chicago District Pipeline case in 1934. I don't remember the date. During the same year I had testified in the Public Service of New Jersey case. I don't remember the date. My testimony in the two cases was not far apart in point. My testimony in the Chicago case involved only the fair rate of return to defendants. I do not remember stating in the Chicago District Pipeline case on July 31, 1934, that I had recently made a study and given testimony as to an estimate on overhead costs involved in a reproduction of the Public Service Electric and Gas Corporation in New Jersey and also as to the going concern value of the electric department of that company, but I probably made such a statement. I had not made a study and given any testimony with respect to any part of the gas system of the company last mentioned. My testimony in the Public Service case had been confined entirely to the electric department or division. So far as I know there were no electric problems involved in the Chicago District Pipeline case.

I would not say that the problem of defendants with respect to lack of efficient management involved any more hazard on account of the difference in degree than the same problem with respect to the 11 companies set out in my Exhibit 148. Another hazard involved in this type of company is lack of sufficient reserves. (Objection by Company Counsel overruled.) I think that there is more danger
1410 of exhaustion of defendants' gas supply than in the case of any of the other companies in my list with the possible exception of the Union of Canada and the National Fuel Company. In the case of those companies, they are large distribution systems and they have coke oven gas available to augment their supply. With respect to the lack of sufficient reserves of natural gas, it is my opinion that defendants face a greater hazard than any of the companies set out in the exhibit last named except the two companies I have just mentioned.

I have not made a study of the reserves of Interstate Natural Gas recently, but I know generally what they are. I made such a study 8 or 10 years ago. I did not go all the way through it. I was in charge of the study for a while, but did not bring it to a conclusion. That company's reserves are in the Monroe field in Louisiana. I think the Odessa or Shreveport field could also be considered a part of this reserve. The Monroe field is not as large as the Texas Panhandle field. I cannot state the comparative extent of the reserves. The Interstate Gas Company's acreage in the Monroe field is 54,000 acres. I do not know their reserves in cubic feet. My own knowledge in that particular case and the general opinion about this company is that it has plenty of gas reserves available, either in the Monroe field or the Odessa field. I don't know the requirements of that company compared to the amount of gas available to it. I know only that it is generally considered to be sufficient to last more than 16 years. I can find the drafts on the Monroe field for pipeline purposes but I have not the information about the drafts on the Odessa field.

The El Paso Natural Gas Company owns comparatively small reserves. It purchases most of its gas. I think that a company which purchases most of its gas is in a better position from the point of view of reserves than a company which owns and controls its own reserves, when there is no more apparent menace to the field than in the case of the fields in Lee County, which is the southeast corner of New Mexico from which the El Paso Company draws its gas. There are estimated reserves in these fields to supply this company at the present rate for 40 years; and there is no apparent danger of any one else coming in. I would say in the case of the El Paso Natural Gas Company that it is in a better position from the point of view of sufficiency of reserves than defendants which own their reserves. I know something about the contract which the El Paso Company has for the purchase of gas. I am not intimately familiar with it. I would not say that I am at all familiar with it. I have never examined these contracts. I think they are for comparatively short terms and that they are renewable on a basis which makes them an acceptable investment hazard. I do not know the basis of their renewal.

The Memphis Natural Gas Company has no reserves. It purchases all its gas in the Monroe field. Its present contract runs to 1944 and it has an option for renewal for 10 years at that time. I don't know anything about the terms of the option. The annual sales of that company are approximately 16,000,000 thousand cubic feet. I think they purchase gas from companies that have the run, so to speak of the Monroe field, and have the same expectancy that there is in the field. I don't know this definitely.

1411 I have said that I could derive the drafts on the Monroe field for pipeline purposes. I don't believe I have the figures in my working papers here. I don't know what the draft is on the Monroe field for carbon black purposes. The Memphis Natural Gas Company gets its gas only under these purchase contracts in the Monroe field. I think the Odessa field can also be considered available to this company, because I understand that gas from the Odessa field has been offered at Monroe.

Considering the probability of the Odessa field being available, I think the Memphis Natural Gas Company is in a better position from the standpoint of reserves than are defendants. To the best of my information I think it is in a better position than these companies without considering the probability of the Odessa field being available. Yes, I have considered the availability of the Hugoton field to defendants.

The Southern Natural Gas Company also purchases gas in the Monroe field. I have no detailed information regarding its contracts. That is the only field in which it has contracts for the purchase of gas. As of this year its sales will be approximately 35,000,000 thousand cubic feet. I don't know the reserves available to them under their purchase contracts except as a general understanding, which is that they are good for more than 16 years. That is the general understanding of myself and those in our office which are more familiar with such things than I am.

The Lone Star Gas Corporation gets its gas from 39 different fields. The corporation is not an operating company. I am speaking of the whole system. Their annual sales are 44 million thousand cubic feet approximately. I think that company produces most of its gas. I don't know that it produces in 39 different fields. I cannot say how their reserves compare with their requirements. I have no information as to the volume of their reserves. There is this observation that may be made about this company, though, and that is that when and if the gas reserves are exhausted, this system consists of such a network that it can be largely used for manufactured gas. In my judgment it would be economic for it to go to manufactured gas when there is no natural gas available. It could be done economically throughout the system generally.

The Mountain Fuel Company gets its supply from three fields in southwestern Wyoming. It produces itself. Its estimated reserves are good for 29 years at the present

rate of draft. I don't know where the information as to the reserves came from originally. I obtained it from a report by Mr. E. D. Warren. I don't know who Mr. Warren is. It was a report made to the Natural Gas Pipeline Company of America some time in 1939. I don't know in what connection that report was made. There is nothing in the report which indicates the purpose unless it was connected with a view of a plan of looping a portion of the line. I don't know whether Mr. Warren is an employee of defendants or not. I don't know in what part of 1939 that report was made. I understand Mr. Warren is an engineer and I should judge so from the report. To the best of my information Mountain Fuel Company is in a better position with respect to sufficiency of reserves than defendants. That conclusion is based on such information as I have. Mr. Warren has not been identified to me. I think there are
no other pipelines taking gas from those three fields.
1412 The Kansas Pipeline Company and the Oklahoma
Natural Gas Company are both transmission and distribution properties companies. I think the Oklahoma Natural Gas Company purchases most of its gas. It purchases 93 per cent of the gas it uses and produces the other 7 per cent. It produces in the Tulsa, Quintum and Chickasaw fields. I am not familiar with the terms of its purchase contracts.

I have assumed that defendants will have their supply of reserves exhausted and be out of business 16 years from January 1, 1939. That is fundamental to my entire testimony. You ask me if the possibility of an inefficient operating organization as contrasted to management is also a hazard. If you mean the possibility of the present management being bad and the investor not knowing it, I would think it is not of enough importance to the investor to warrant his looking into it. If you mean the possibility of the management going bad in the future, that is something that faces every business. If an investor is contemplating an investment in a natural gas company and up to that time, so far as he is aware, there is nothing wrong with the management, I think it wise and prudent on the part of the investor to make some attempt to find out whether the management of the company is good, bad or indifferent, efficient or inefficient. You ask me if there then is not a possibility of hazard with respect to the investment that faces an investor, as to the possible inefficiency of the management. I cannot answer that question any more completely or specifically than I have answered it. If he finds out that the management is not good, he won't invest in it. I suppose it is possible that he might make an investment and then find out that the management is inefficient. Under such circumstances, if management counted with him, he certainly would sell out. That is a possible hazard that exists in every line of business. There might be degrees of that hazard among different companies.

It is not my opinion that there is a greater hazard in that particular respect concerning defendants than there is in the 11 companies mentioned in Exhibit 148. I think it would be very difficult to find a better management than that of defendants. I think the operating organization is a direct function of the management. It is established and trained and the management permeates all through it. When I was discussing management a few questions back, I had in mind the management. One of the tests of a good management is whether the organization is good or not. In fact, that is the chief test. I can disassociate in my mind the management from the rest of the organization when the management is new. When a management and an organization have been working together for some time, I cannot. The matter of using up to date machinery and methods of production to avail one's self of the possible advances in the art which are economically available, are functions of management. I cannot answer your question whether the failure to use up to date machinery, up to date methods of production, and so on, by a company is a possible hazard to an investor in that company. I do not think Texoma is inferior to each company set out in Exhibit 148 so far as the use of up to date machinery and methods of production is concerned. I cannot say that they are better in that respect, but I think that they would equal each of the other companies insofar as those points are concerned. I would not say that both of defendants are inferior to any of the companies shown in my Exhibit 148.

1413 I don't think the possibility of drilling a large number of dry holes is looked on as a hazard by an investor. I do not look at it as such a hazard. I have made no attempt to find out the number of dry holes Texoma has drilled since it went into the business of producing natural gas, and how that number has compared with dry holes drilled by any of the other production companies shown in Exhibit 148. I do not think that the high cost per well of drilling is classed as a hazard. When costs of production are not known there would be some hazard regarding it, but in a settled field those conditions would be pretty well known. I do not consider the Texas Panhandle field a settled field as of 1931. Where there is any doubt about the cost of production, it would be a hazard. I do not know how Texoma's production costs compare with the production costs of the other companies shown in Exhibit 148. I do not know how the average cost of Texoma's wells compares with the average cost of the wells of the other companies in Exhibit 148 which produce their own gas, except that the production costs in that field are lower than in other fields generally.

I don't know what the average open flow of Texoma's wells is and how that compares with the average open flow of the wells of the other companies shown in Exhibit 148.

As to whether a decline in rock pressures would be a hazard facing an investor in a production company, practically all rock pressures decline. In my opinion the degree of decline is not a factor of risk. In other words, I do not think an investor, making an investment in one company whose rock pressures decline twice as rapidly per unit of production as do those of a second company, faces an additional hazard in that connection. I did not attempt to determine the decline in rock pressures per unit of production for the Texoma wells as compared with the rock pressure decline per unit of production for the wells from which the 11 companies shown in Exhibit 148 derive their gas.

You ask me if any of the companies shown in Exhibit 148 have as large a single market as the city of Chicago. I think none of them reaches so large a population and volume of industry. The market depends upon competitive fuels and that is true even as to the domestic market because domestic gas can be manufactured. At the present time domestic gas for Chicago cannot be manufactured more cheaply than natural gas can be brought to Chicago. The purpose of bringing natural gas to Chicago was to supply it more cheaply than gas could be manufactured there. I do not consider the Chicago market as a great advantage to defendants. If it depends upon the market for gas as defined by other fuels, it might be a menace because of competition.

I stated I excluded any advantage of the Chicago market in making up my mind as to the going concern value of defendants. I considered it, but excluded it in reaching my opinion. Regardless of what appears on page 4792 of the record, I think I stated specifically in another place that I would not take any account of that factor. If defendants were serving territory out in Arizona instead of Chicago and all other factors considered in my Exhibit 130 were the same, I would say that they would have a going concern value of 8½ million dollars if they were on their feet and earning as much as now. I might modify the latter part of that answer by saying, earning to the extent of supporting them. The earnings go into the ultimate determination 1414 of the amount of going concern value only to the extent that earnings are supporting the investment. To that extent my answer to your question is in the affirmative. The fact that they serve Chicago is responsible for the earnings which support them. It is a fact that I considered it advantageous to defendants that they are serving a market like the Chicago market insofar as the market supported the investment. If the market for natural gas were greater than defendants can supply and they are now up to their limit, any greater market would invite competition. To the extent that the market produces earnings more than enough to support the investment, that is just as likely to be a menace as an advantage because it will invite competition.

I have never attempted to determine at what price Peoples Gas Light and Coke Company would have to buy natural gas in order to buy it from anyone other than Chicago District Pipeline Company. (Objection by Company Counsel overruled.) I don't think there is any immediate menace of competition facing defendants. There is a potential menace. I would not say that the market of defendants is inferior to the market of any of the companies shown in Exhibit 148 except insofar as it is at the end of a long line. I think the competition from other fuels is somewhat more severe in Chicago than in most of the other places. Viewing the market broadly, I am not prepared to say that defendants' market is inferior to the market of any of the companies shown in Exhibit 148, other than that it is at the end of a longer line.

I do not view as a hazard the possible inability of owners to provide capital if needed in the course of the business. If six investors were going into an enterprise, it would be a less hazardous investment or enterprise to person "A" if the other five were strong financially than if they were weak. If there is the possibility that a substantial amount of capital would be required, it is better to have as associates in an enterprise people who could provide capital if such a contingency should arise. Otherwise the company would be confronted with a hazard of having to go out and pay what the public demanded for that kind of risk.

I don't think that substantial amounts of outside capital are required by defendants from time to time. Their capital requirements can be diverted from the earnings. It is easier to divert capital from earnings when the owners of a business do not have immediate necessity for those earnings or for that portion of the earnings. If the capital requirements are the same proportionately for two companies, the company whose owners are in a position either to put up capital as required or forego earnings so that the company may use a portion of the earnings for capital purposes, is in a stronger position than the company in which those conditions do not obtain.

I would not say that defendants are in a weaker position in that respect than any of the companies shown in Exhibit 148. (Objection by Company Counsel overruled.) I do not think I connected my answer in any respect to hazards. I think an investor would take into account the
1415 fact, if true, that his associates in the business are
not as strong financially as another group of associates that he might have in a business. I took no such hazard as that into account in arriving at my judgment of a fair rate of return for defendants. The companies listed in my Exhibit 148 are all in generally sound condition and that is as far as I went with that consideration. The position of defendants on that point was not taken into consideration in arriving at my ultimate judgment.

I don't know how a high investment per unit of capacity or unit of production would be considered as a hazard. You ask whether an investor looking at two businesses, both of them producing the same product, and observing that one of them has a higher investment per unit of production and a higher investment per unit of capacity, would be inclined to require a higher yield from that company than from the company with the lesser investment per unit of production. I cannot answer that question. I don't understand it. I cannot answer your question as to whether a company with a capacity factor of 20 per cent would be more risky than one which has a capacity factor of 50 per cent, all other things being equal.

I do not see why the possibility of over-capitalization of an enterprise in which an investor is about to invest is a distinct hazard to that investor. (Objection by Company Counsel overruled.) You ask if over-capitalization of Southern Natural Gas Company did not result in a distinct loss to my firm which had an investment in that company. Over-capitalization is a very loose term and I do not know how to answer that question except that on account of the depression coming on, the company was not able to pay interest and sinking fund charges that accrued. It was not able to earn enough to support its capital structure, including the sinking fund and taking account of the extreme depression. I cannot answer whether or not the possibility of that happening to any company is a hazard to an investor in any company. In my judgment defendants are not capitalized at all, in the sense that its securities are distributed. It is more an effective partnership. I do not consider defendants over-capitalized under the present distribution of securities.

In my testimony on direct examination I spoke of river crossings as one of the hazards. I made somewhat of a comparison of that feature of defendants with a similar feature of the operations of the companies set out in Exhibit 148. I compared the situation of defendants on this point with some of the companies listed in that exhibit, including Interstate, Southern Natural, Memphis, El Paso and Mountain Fuel. I have always been fairly well informed as to Interstate, Southern and Memphis. I have gained my information regarding the others some time within the last few weeks. I cannot tell just when. I don't remember whether it was before my direct testimony or not.

I spoke also of the possibility of salt water intrusion into the wells of defendants as a hazard which they faced. I have not compared that possibility with the possibility of salt water intrusion into the wells supplying the companies listed in Exhibit 148.

As to failure to make adequate provision for depreciation and depletion or for amortization, I think the investor would inform himself about it and if he is informed it
1416 would not be a hazard. Inadequate provision by the management for that purpose might happen with one company as much as with another. I suppose such a development might work to the disadvantage of the investor. I cannot see how that would work out. I think an investor

satisfies himself about depreciation and depletion and amortization. Yes, the making of proper and adequate provision for depreciation and depletion and amortization is considered necessary for the protection of an investor in an enterprise of this nature. Yes, there is a possibility that such provision will not be made just as there is a possibility of almost anything happening. There have been cases where public utilities have not provided enough, but I do not think of any cases where they have provided enough until the investor got hooked, so to speak, and then stopped making provision. I do not think in those cases where inadequate provision was made for depreciation the investors were a fixed static body. The personnel of the investors may shift more or less from time to time. The damage in a case where inadequate provision for depreciation had been made would come from a falling off in earnings.

The purpose of making provision for depreciation is primarily to make replacements when necessary. One theory is that it preserves intact the investment. I do not think it is necessary to make the so-called value of the property plus the depreciation reserve equal to the original investment. As I understand the function of reserves they are to provide for replacement and for retirement of property when retirement takes place. Provision is made for depreciation through annual accruals. That is the first step in the process. I don't see why the possibility that the management will fail to make proper annual provision for depreciation, depletion and amortization is a hazard in this business any more than it is in any other line of business. It is an ordinary business hazard, if that is the way you look at it. It is like any other possibility. I don't see how an investor can differentiate in that respect between two companies or two businesses. I do not call the possibility that the company may make inadequate provision for depreciation and depletion a hazard. Certainly it makes a difference to the investor whether or not the company makes proper or improper provision for depreciation and depletion. It is a question of what they are doing at the time. If after the investment is made the company the following year fails to make adequate provision for depreciation and depletion, such circumstance, generally speaking, does not make the investment look as good as it would if the company had earned that depreciation. I don't see how an investor contemplating investments in an array of different types of businesses or different businesses of the same type could take into account the possibility that some one or more of them might make inadequate provision for depreciation and depletion.

(At this point counsel for complainant announced that pursuant to a suggestion of the Examiner he was withdrawing the original Exhibit 156 and was substituting therefor photostatic copies of it. The substitution was permitted by the Examiner.

Counsel for complainant then withdrew Exhibit 157 and produced another document which he described as a certified copy of Mr. Gallagher's testimony before the Illinois Commerce Commission in connection with Exhibits 2 and 2-A, which are incorporated in Exhibit 156. In the proceeding before the Commission last named the testimony covered by the certification began with page 12 and ran through page 99. The counsel for complainant requested that it be marked as an exhibit. At the direction of the Examiner the document referred to was marked for
1417 identification as Exhibit 157.

Exhibits 156 and 157 were offered in evidence. The Examiner withheld his ruling until the following day.)

In my direct testimony I stated that my office receives publications dealing with the gas industry, including the "American Gas Association Monthly" and the magazine "Gas Age". I think we receive the magazine "Gas" which you state has now recently been absorbed into another trade magazine. We use these magazines and similar publications to keep informed of developments in the field. They are standard trade journals. We also keep in our files Moody's Public Utility Manuals and Poor's Public Utility Manuals. We consult those frequently for information with respect to the different utility industries and the different specific utilities.

I think that in my testimony in the summer of 1934 before the Master in the Chicago District Pipeline Company versus Lindheimer case I stated a portion of the method which I myself embodied in Exhibit 49 in that case.

(At this point counsel for the Commission produced a document with the request that it be marked for identification. At the direction of the Examiner the document was marked for identification as Exhibit 167.)

Exhibit 167 is apparently a photostatic copy of my Exhibit 49 put into evidence during my testimony in the case of Chicago District Pipeline Company versus Lindheimer.

Included in Exhibit 167 are the bonds of natural gas companies, principally production and transmission companies. In some cases distribution was involved in addition to production and transmission. I included therein all the issues of such companies from the year 1925 through 1932. I took the market price as of June 30, 1934, of those issues. That was approximately a month before I testified. I took the amount outstanding for each of those issues as of the end of the preceding year. I computed the approximate yield to maturity of those issues and also the current yields. The reason I left out the current yield was because the yield I ultimately used as the basis of my judgment was the yield to maturity.

I got a figure representing the weighted average for the current yield and the yield to maturity of the bonds shown in that exhibit. The approximate yield to maturity was 9.7 per cent. At that time I testified in answer to a question by Mr. Daily as to what yield in my opinion the bonds of Natural Gas Pipeline Company of America would have to show in order to secure capital at that time that I thought it would be reasonable to estimate the rate at 9.7 per cent, based on the current prices for the average of the 41 natural gas bonds which I had considered, not including those on which interest had been defaulted, in connection with Exhibit 49 there and marked Exhibit 167 here. Mr. Daily then asked me this question: "In examining the data as to the 55 natural gas companies which issued the 73 natural gas bond issues shown on Plaintiff's Exhibit 49, did you investigate the question of the data available as to some of the companies with respect to the relation between their outstanding bonds and their preferred and their common stock, that is to say, as to the relative amounts, and, if so, how many companies did you find as to which such data was readily available?" To this question I answered "23". Mr. Daily then asked
1418 me whether I had studied those 23 companies for the purpose of determining the average proportions between the issues of bonds, preferred stock and common stock, and what I found to be the proportions. I answered that I had made such a study and found that bonds on the average constituted 49.7 per cent of the investment and preferred stock 13.9 per cent, leaving for the common stock equity 36.4 per cent. Determining that relationship was a step in the development of the method by which I arrived at my conclusion at that time as to the return,

based on the exhibit which has been marked Exhibit 167 in the present case.

I then proceeded to read or have incorporated into the record the 23 companies in question from which I got those average figures showing the relationship of bonds, preferred and common stock. Then the following questions were asked me by Mr. Daily and were answered by me: "Question: Will you now state again, if you have not already stated, the basis on which you selected those 23 companies? Answer: Well, those were the companies from which I could readily determine the data without too great research and computation being involved. Question: What would you say as to whether or not at the present time if bonds of a natural gas enterprise were to be marketed, it would be good practice to issue more bonds in proportion than those you have indicated? Answer: I think the proportions I have indicated as to bonds would be good practice as of the present time. The proportion of preferred stock is probably somewhat low."

Mr. Daily then asked me whether I had made a further study for the purpose of determining the relation of the yields of bonds and preferred stock and of earnings on common stock for natural gas companies, to which I replied in the affirmative, adding that as in making this study it was necessary to go back for a period of 10 years, I had confined my analysis to 7 natural gas companies. That 10-year period was approximately 1924 to 1933, the 10-year period preceding the year of my testimony, which was in 1934. I then proceeded to name the 7 companies I had used. I was asked to state the proportions which I determined from that study. My answer was that the ratio of the preferred stock yield, that is, the preferred stock dividend rate divided by the average market value of the preferred stock, was 1.1 times the average yield of the bonds to maturity. The earnings of the common stock equity were at the rate of 1.4 times the maturity yield of the bonds.

In answer to another question as to whether those yields were representative of the proportions attained in the better class of companies in that industry I stated that I thought the ratios were comparatively low, that is, that ordinarily it would be expected that the preferred stock yield and the common stock yield would be greater with respect to the bond yield. Mr. Daily then asked me to give the comparative figures as to preferred stock and common

stock that would result if I took the bond yield at 9.7 per cent instead of the 1.00 assumed as the basis of comparison. My answer was that the comparative yield for preferred stock would be 10.7 per cent and for the common stock equity 13.6 per cent. I then answered that if those figures be applied to the proportions between bonds, preferred stock and common stock which I had stated I derived from a study of the 23 companies, the result of the calculation with respect to the return upon the securities as a whole would on a weighted average basis be 11.25 per cent. I explained that the figure last named was
1419 derived by multiplying 9.7 by 50 per cent, the 9.7
being the necessary bond yield which I derived and the 50 per cent being the proportion of bonds to the total investment. For preferred stock I took 14 per cent and multiplied it by 10.7, the necessary preferred stock yield, which gave 1.5. Multiplying 36 per cent by 13.6, the necessary rate of earnings on the common stock, gave a result of 4.9. The sum of the products was 11.25 which represented the average rate of return estimated to be necessary on the whole property at the rates determined. I then testified that, in my opinion, the figure last mentioned fully measured the rate of earnings which would constitute a fair rate of return to a natural gas enterprise of the character and in the position of Natural Gas Pipeline Company of America as based on the experience of other companies and the market appraisals of such investments.

If I were to bring that exhibit down to date, I would take the issues that were shown in that exhibit and for the first step include those which are still in existence; and I would include also such refunding or replacement issues as I found replacing or refunding the issues used. I would also include such other financing as had been done by similar companies in the period 1933 through 1938. That would give me a list of securities to start with. If I were testifying as I did here at the early part of October, I would take the market price of those securities as of August 31, 1939, and from such market prices would determine the yield to maturity of each of the issues there shown. I would then determine the weighted average yield to maturity. Then having determined that weighted average yield to maturity, in order to arrive at a final figure which would be comparable to the figure of 11.25 per cent return which I arrived at in the Chicago District Pipeline case, the first step would be to multiply that weighted average yield by 50, if I found that to be the approximate proportion of bonds at that time.

I would determine the proportions of bonds, preferred stock and common stock now. When Mr. Slaff put the last question to me I thought he referred to that step and not to the 50 per cent. I cannot tell as to whether it would be 50 per cent or how near 50 per cent it would be today. Yes, I testified at the beginning of my cross-examination that a sound capitalization for a natural gas company today would be approximately 50 per cent bonds, 25 per cent preferred and 25 per cent common stock. On the basis of my 1934 study as to the proportionality of bonds, preferred and common stock, I would, in coming to my final figure, take as the first step the multiplication of my weighted average of bond yields by 50 per cent, if I found that to be the proper proportion now. If I found those same proportions to exist today between bonds, common and preferred stock, I would multiply the weighted average of bond yields by 50 per cent. If I found the same ratio to exist between earnings on preferred and earnings on bonds and the same proportionality to bonds, I would then multiply as my next step the weighted average bond yield by 1.1 and then by 14 per cent. The final step on the same basis would be to multiply the weighted average bond yield by 1.4 and then by 36 per cent.

That would give me an overall figure comparable to my figure of 11.25 per cent in the Chicago District Pipeline case on the basis of those same units. You have asked me to assume that the weighted average of bond yields that we have been discussing here is 5.5 per cent. Based on that assumption the over-all figure comparable to the
1420 figure of 11.25 per cent in the Chicago District Pipeline Company case would be 6.38 per cent. That is arrived at by multiplying 5.5 by 50 per cent, 5.5 by 1.1 by 14 per cent, and 5.5 by 1.4 by 36 per cent.

(At this point counsel for the Commission offered EXHIBIT 167 in evidence. The Examiner reserved his ruling until the following day.)

At the time I testified in the Chicago District Pipeline Company case I stated that a company should not be left on the verge of starvation and that therefore a liberal allowance should be made. After I explained how I had arrived at the figure of 11.25 per cent, I testified that that figure represents the rate which would command capital, in my judgment, without additional reward to the company for operation and management. I stated it would be a minimum rate; and in all probability it would be more than that. I was referring to that rate of 11.25 per cent. I then stated that I thought that an addition should be made to this computation for the reason that in order for any business to be in a position constantly to furnish high grade service to its customers, the company must not be kept on the verge of starvation, that is, it must be permitted to earn something more than the rate which would just barely command the capital. I was referring to defendants in making that statement. The sense of my testimony was that something in addition to 11.25 per cent should be allowed. The expression, "The company must not be kept on the verge of starvation," was mine. I then went on to testify that a reasonable return for a company of the character of defendants would not be less than 12 per cent after allowance for amortization and depreciation.

There has been a time in the last 20 years when bond holders demanded a very high amount of the total earnings as during that period 1932, 1933 and 1934 and most of the bonds carried warrants or some features which gave them valuations in excess of what would be indicated by their coupon rate. I think generally the coverage demanded now is greater than it was then, particularly to obtain acceptance by investors. In determining the relation of the yield of bonds and preferred stocks and of earnings on common stocks for natural gas companies, in which I used the yield on bonds as 1, on preferred as 1.1, and on common stocks as 1.4, I went back for a period of 10 years from the time I was then testifying.

That average yield of 9.7 per cent was the average for only 7 companies. The reason I could take only 7 was because I wanted to go back for a period of 10 years, as I stated in my answer read to me earlier today. The document to which I have been referring is the transcript of the 1934 case and I have also referred to my own notes in the 1934 case.

I testified earlier in my cross-examination that I had previously testified a year and a half or thereabouts ago in the Interborough Rapid Transit Company tax case. I was appearing there on behalf of the receiver for that company. The question of how much that company should take as an income tax deduction for annual amortization

of the value of its contracts to operate the New York subways, was involved there. The Interborough in that proceeding was interested in arriving at as high a value for its right to operate those subways as was possible. The
higher the valuation, the greater the annual deduc-
1421 tion would be. I made a valuation on the basis of
what a willing purchaser would pay for that system, buying it from a willing seller. I don't remember that there was anything like capitalization of the earnings. The present value was estimated by discounting the estimated earnings. I suppose there are two senses in which the word "capitalization" can be used. One is to place an amount against the capital account and the other is, as the saying goes, to capitalize earnings by dividing them by the required rate of return and arriving at a capital value that they would support. I don't think it was in the latter sense that I capitalized the earnings of the Interborough at a certain rate of return in order to arrive at the figure of value. I think it was a plain discount.

In my direct testimony I testified that: "At the discount rate of 6 per cent and the accumulation rate of 4 per cent as determined, I computed the value represented by annual earnings of $8,230,000 from March 1, 1913, at 1968 at $127,000,000." The accumulation rate of 4 per cent mentioned in that portion of the answer just read referred to the amortization fund that was being built up to amortize the investment. You ask me if I remember that on cross-examination the following question was put to me: "Of course, your figure of $8,300,000 as average earnings on which you relied in arriving at your March 1, 1913, valuation was an earning figure in excess of the earnings of the subway for the prior periods or periods prior to 1913?"; and if I did not answer: "It was a little in excess of it then, yes." You also ask if I was not then asked the question as to whether I capitalized, in a general sense, this figure of $8,300,000 in arriving at my valuation, to which I replied "Yes." I remember counsel asking me about that but I corrected that afterwards in the cross-examination. He referred to it again as capitalization and I corrected it. I do not understand at all that that is essentially what was done.

If I had used a higher rate of return than I used in the computation in that case, I would have arrived at a lower value. The higher the rate of return used as a capitalization basis, the lower the value that is reached. If in the Interborough tax case a rate of return higher than 6 per cent had been used, I would have arrived at a valuation lower than that reached. In that case I did use a rate of return of 6 per cent.

I testified in the Brooklyn Rapid Transit Company franchise tax case about a year or so ago. I don't remember whether the tax on the franchise value of the Brooklyn Rapid Transit Company or one of its subsidiary companies was involved in that case. In effect it applied to the Brooklyn Rapid Transit Company. The problem there was to find the franchise value of the company for tax purposes.

I was aware at the time I testified of the method in New York as set down in the case, I believe, of Jamaica Water Supply Company against the Tax Commissioners, of arriving at franchise value. The method set out in that case is to ascertain the gross earnings, deduct the operating expenses, which gives the net return, and then deduct a fair and reasonable return on that portion of the capital of the corporation invested in tangible property. The resulting balance gives the earnings attributable to the special franchise. Then if the balance be capitalized at a fair rate, you have the value of the special franchise. The less deducted as applicable to earnings on the tangible
property, the greater the franchise value. I testified
1422 in that case that a fair rate of return on the tangible
property of that company was 6 per cent, the tangible property being defined as the cost of reproduction new less a substantial amount for depreciation, which gave an amount substantially less than the bonds outstanding secured by the property.

With respect to my Exhibit 149, in preparing the exhibit originally I assumed that the cost of a line operating at a lower pressure was the same as the cost of the present line. I made the comparison on that basis. That is to say, I assumed that the cost of the entire project was the same in either case. As to whether or not defendants would require less reserves if they were selling less gas, I think that is entirely a matter of expectancy. I do not know enough about the field or the conditions there or the conditions confronting defendants to say. I have assumed that it would take the same amount of reserves in both cases. Generally speaking, a company which requires only 80 per cent of the gas that another company requires, does not require the same amount of reserves; but I do not know about the conditions under which defendants acquired their reserves. On the face of it they would not require the same amount of reserves as they do now if they were using only 80 per cent as much gas as now used, but, as I say, I do not know the conditions under which defendants acquired their reserves. Other things being equal, it might appear that they might get along with less reserves; but I do not know about the conditions surrounding defendants or what the expectancy was, or what they were confronted with in providing for their reserves. In my Exhibit 149 I have assumed other things to be equal so far as the line costs are concerned.

That exhibit shows the defendants would use only approximately 80 per cent of the gas which they now use, if they were to operate at the lower pressure. As to whether or not defendants would require the same amount of reserves that they do now if they were selling only 80 per cent as much gas under the conditions portrayed on my Exhibit 149, I can only repeat my answer that I do not know enough about the field or the conditions under which defendants bought their acreage to say. On the face of it, it would appear that they could get along with less, but I do not understand that the required reserve would be the proportion their holdings are exactly to what the line is taking.

In my testimony and exhibit I undertook to make certain comparisons of what I deemed to be important factors in this case. One of those was the comparison between the investment in the company operating at its present pressure, and an investment in the company operating at a lower pressure. I assumed in my direct testimony that the investment was the same. That assumption was based in the first instance, if we took this by steps, on the assumption that the company would require and would have the same amount of gas reserves operating at a lower pressure as it now has. As to whether that is a valid assumption I don't know. There may be other considerations in there. I think very likely there were. I don't know of any other.

So then we can summarize the situation in this respect by saying that I do not know of any conditions which would require defendants, if they were using only 80 per cent of the gas which they are now using, to have the same amount of gas reserves that they now have.

1423 I do not think it is correct to say that defendants, if they were to produce and use 80 per cent of the gas that they now produce and use, would not require as many wells as they now have. I think the drilling of wells is governed by the proving and protection of leases more than by the amount of gas required. In the course of years the amount of gas required does have a certain effect on the number of wells drilled, but not in the earlier years. As time goes on the amount of gas produced or required by a company is an important factor in the number of wells that are drilled. (Objection by Company counsel overruled.) Other things being equal, a company producing only 25 per cent of the gas that defendants require would not drill as many wells as defendants would. The number of wells depends upon the development of the field, which has been generally going on up to this time, and I would think that the number of wells would not be affected by the circumstance that defendants were taking only 80 per cent as much gas as at present. During the development of the field the number of wells drilled depends very little on the requirements of the particular company for gas. By "development of the field" I mean the period of exploration and the protection of acreage. It is my understanding that the Texas Panhandle field is still in the development period. From the viewpoint of going concern value to which I have testified, Texoma is a company whose reserves are in a field where the developmental period still continues.

1424 In my judgment a company which required 80 per cent of the gas which defendants have required in the last 7 or 8 years would have drilled the same number of wells as defendants have drilled, if it had purchased the same acreage that defendants purchased. I can not name any reasons why defendants would have bought the same amount of acreage if they had required only 80 per cent of the gas they had actually taken. All other factors being equal, if defendants had required 80 per cent as much acreage as they did, I think they would have required fewer wells to protect it. As to whether or not the company requiring 80 per cent of the gas that defendants require would not need the same amount of gathering lines that defendants now have, would depend upon the distribution of the acreage. Other things being equal, it would not require as much gathering line. I don't know whether it would require the same amount of field measuring and regulating station equipment that defendants now require. Generally speaking, other things being equal, if the acreage were less, the field measuring equipment might be less. Generally speaking, other things being equal and if the acreage were less, the whole natural gas production plant would be less.

Under the same circumstances, the company operating at 500 pounds pressure as compared with a company operating at higher pressure would require less compression equipment at the field station. It would not require less compression equipment at the stations along the line. The investment would be less at the field station and slightly less at the line stations on account of less cost of fitting. This was the first time that a line was operated at those high pressures. So far as I know, it was not necessary to make special designs for the compressor station equipment all up and down the line to operate the line at those high pressures, except that defendants have been put to some expense in replacing compression pistons. In the matter of discharge pressure, there was considerable advance above what had been done before in the industry as a whole. I do not know of my own knowledge but I am informed that this circumstance did not involve more expense for equipment than for equipment which had been standard up to that time in the industry.

With respect to the pipeline itself, I have made comparisons as to the cost of pipe for a pipeline operating at 500 pounds pressure and this pipeline over the same route. I have had comparisons made of the actual line and the principal items in a line built to the conventional pressures and stresses with the material available before this company undertook its research, which would be a lap weld pipe, stressed to 15,000 pounds per square inch and 13-32 inches in thickness. The cost of a line of conventional type would have been, including the compressor stations and an allowance for a reduction in the gasoline and refrigeration plant, $2,367,164 more than the actual cost of this line.

As I have explained, I have had the difference computed in the important items, and applying the difference

in the important items, I get an estimated cost of $52,197,643 for the pipeline, compressor stations, gasoline and refrigeration plants; as compared with a book cost of $49,830,479. Subsequent to the presentation of my
1425 direct testimony here, and in pursuance of an answer
to the Examiner's question, I asked Mr. Brown of our organization, who is familiar with such things, to make me up such an estimate. As I stated, he has only computed the important items that would be affected. I have not said that Mr. Brown was able to compute the cost of building a pipeline in 1930 and 1931 from the Texas Panhandle to Chicago to operate at 500 pounds pressure, in three weeks' time. Derived, as I explained, by computing the difference in cost of the important items that would be changed, we reached the result I have stated.

If any further explanation of that is required, this was arrived at after consultation with Mr. Rhodes who has had more experience in building pipelines and in estimates than anyone else in our office, and it was his opinion that except for these items, there would be very little difference. (Objection by Company Counsel overruled.) Yes, our Mr. Rhodes and our Mr. Brown in arriving at the estimate in the manner I have explained, were able to project themselves back to 1930 and 1931, and in a period of two or three weeks come up with an answer as to the cost of building a pipeline from the Texas Panhandle field up to Chicago to operate at 500 pounds pressure. Ford, Bacon & Davis built about 250 miles of this line. As I remember it, they bid on other portions of the line. They were bidding on the line that was actually built.

We were engaged at about the time this line was built as engineers for the Southern Natural, which was laying just this kind of a line, and our engineers are all very familiar with the prices that go into that. I hope I do not have to say that with our years of experience in the engineering business, we would not try to impose on this Commission. (Commission Counsel renews his motion and offer in evidence of Exhibits 164, 165 and 166 in the light of the witness's most recent testimony with the request that portions of Exhibit 165 be read into the record. The Examiner refused to reproduce the exhibits in the record and denied the offer and motion to receive the exhibits into evidence.)

Cross-Examination by Mr. Booth.

In response to a question that was addressed to me a few minutes ago by Mr. Slaff, I read into the record a figure which was prepared by certain members of the staff of Ford, Bacon & Davis. I did not personally prepare these figures or any portion of them. I did not participate in or supervise the construction of any portion of defendants' pipeline built by Ford, Bacon & Davis. I have very little to do with construction now. I used to years ago. That was 30 or 40 years ago.

I have given incidental attention to it at various times. I had something to do with the Edmonton line in the way of going over the job while construction was in progress, and at different times I have had something to do in the construction work, but not a great deal.

I am a member of the Executive Committee of our organization and executive matters come before that body. I keep up with them in an executive way.

Cross-Examination Interposed by Mr. Slaff.

Regarding the incident as to the changes in the bank interest rate to the Southern Natural, I think I might be permitted to say that that letter from the bank was dated July 13. I was out of the office from June 30 to September 2, except for one day in the office. I do not think I have known about that anyhow, because it is an administrative matter and it probably would go before the board of directors when they met. I doubt very much that I would have known about it unless I had come across it in going over their monthly report. I have said
1426 that I am a member of the Executive Committee of my firm.

Cross-Examination Resumed by Mr. Booth.

I hardly know how to characterize my participation in the construction activities of the company in the past 15 years. I am an officer and a director of the firm, and a director of our construction corporation. It seems to me that my connection with construction has been a little more than nominal, but it has not been extensive. There is a corporation that handles most of the construction activities of Ford, Bacon & Davis. It is known as the Ford, Bacon & Davis Construction Corporation. There are about 200 men altogether in the Ford, Bacon & Davis organization. It has a subsidiary construction corporation which for the last four or five years has done very little and has nothing more than a skeleton organization at present. That is due to the decline in its construction contracts. This separate construction corporation handled the building of such part of the line of defendants as was constructed by Ford, Bacon & Davis. The contract was with Ford, Bacon & Davis, Inc.

Mr. E. G. Hill, the president of the construction corporation, is in charge of the construction of most pipeline work. Mr. Whitaker has charge of the construction of the electrical work. I have never supervised the construction of a 24-inch pipeline, a 22-inch pipeline, or a 20-inch pipeline.

I think the Edmonton line was 16-inches, but it was constructed quite a number of years ago. I did not supervise the construction of that line. I think it was built about 1925.

Only about 10 or 12 per cent of my work has been in utility rate cases in the past few years. You ask me to assume the construction of a pipeline such as is owned by defendants and also the organization of a corporation such as Texoma in 1930, and that the investors were advised at that time by reliable and competent geologists and engineers that the property would have a life of 25 years, and to state over what period the investors would expect the property to be amortized. They would expect it to be amortized during the life of the project, not necessarily during the first year of the company's operations. No, the company would not wait until the 24th year. I think that when the earnings permitted the company to either amortize the investment or to set up a sinking fund for amortization, it would begin to make provision for amortization. You ask me to assume the company had substantial earnings during the first, the second and the third years of its operation. (Objection by Company Counsel overruled.) That is such a wild assumption that I cannot give any consideration to it. That is such an unusual combination of conditions that I am unable to apply my mind to it. For a pipeline to earn so much money during the first few years that it can amortize part of its property is an unusual combination of conditions.

I think that when it has earned a fair return on the investment from the time of the beginning and has accumulated a cushion fund, it would ordinarily be prudent to amortize the investment in one way or another, generally by retiring bonds. I am somewhat familiar with the history of defendants. You have asked me whether or not, based upon my study of the defendants' operations, they earned enough to set aside anything for depreciation or depletion during the first full year of their operations in 1932. (Objection by Company Counsel overruled.) They did not. That is my recollection of the situation. I think the defendants set aside a small amount for depreciation in 1933. I do not recall the amount. My recollection is that it was something like a million dollars, and that a similar sum was set aside in 1934. 1427

The indenture provides for a serial retirement of the bonds of defendants. I do not recall when the retirement was to begin. It was a few years after the line was placed in operation, but I do not remember the date. The bondholders, where bonds are distributed among the public, would require that a sinking fund begin as soon as the earnings permitted. That is a reasonable requirement.

You have asked me whether or not I consider it appropriate for the management of a company such as defendants to defer providing for amortization of the investment in a property such as this because they felt that some time during the operations of the company and before the company went out of business that the business would be subject to regulation at some future time. Supposing they felt that at some time during the operations of the company the business would be subject to regulation, what would they have to expect then? My answer is that I would not think that the appropriations for amortization would be governed by any such consideration as that. I should think that such appropriations would simply be a function of the earnings available and the expected time of passing out of business. (November 4, 1939.)

(At this point EXHIBIT NO. 157, theretofore offered in evidence by counsel for complainant, was received in evidence.)

Questions by the Examiner.

I have not made a figure for figure check of Exhibit No. 167, but I have no doubt but that it is an exact copy of Exhibit 49, of which it purports to be a copy. I have made a spot check of it which satisfied me that it is a true copy. I checked the heading and several items here and there.

(At this point, EXHIBIT NO. 167, theretofore offered in evidence by counsel for the Commission, was received in evidence, over the objection of counsel for defendants who were allowed an exception.

At this point, counsel for the Commission presented a document described as a copy of Exhibit 153 for identification, certified by the Secretary of the Securities and Exchange Commission. At the direction of the Examiner, the document was marked Exhibit No. 153 for identification. The previous uncertified copy of the same document, heretofore marked Exhibit No. 153, was stricken from the record. EXHIBIT NO. 153 was then offered and received in evidence without objection.)

Cross-Examination by Mr. Slaff.

The bulk of such financing as has taken place in the natural gas industry since 1934 has been debt financing. I cannot say definitely that practically no common stock financing has occurred in that time. I think there have been sales of stock, but I cannot name them definitely. The volume of stock transactions would be small in comparison to the transactions in bonds. The same is true of preferred stock financing since that time.

I have been working on testimony and preparation of testimony on rate of return in this proceeding and in the one which immediately preceded it before the Illinois
1428 Commerce Commission, off and on for 18 months. In
this period, I did not undertake this extensive computation involved in my Exhibit No. 149. You state that it was not such an extensive computation. It was quite a study. It is a question as to what you mean by "extensive" as compared with a "non-extensive" computation. I think there were more people engaged on that computation than 2. The time involved, as I remember it, was between three or four weeks. We arrived at an answer within three or four weeks after my direct testimony. When I testified on direct that was what I considered such an extensive computation that in the 18 months I had to prepare my direct testimony I had not done it. At the time I was testifying on direct examination I thought that, considering the use of the computation, it was not warranted at that time.

The interest rate on the Lone Star Gas Company bank loan referred to in Exhibit No. 148 was reduced from 2⅞ per cent to 2⅜ per cent, some time in 1939. I have the date here as September 18, 1939. I don't know whether that is the date of the S.E.C. authorization or the date of the reduction. I found out about this reduction some time during the course of our study. I doubt if I knew about it before I testified on direct. The note I am now looking at reads "Lone Star Gas Company, interest on bank loans reduced 2⅞ to 2⅜, authorized by the S.E.C. September 18, 1939". That is part of my working papers. It was authorized by the S.E.C. on September 18, 1939.

I testified here in October on direct, and put Exhibit No. 148 in evidence at that time. No, that is not one of those things that I was going to bring up on redirect. That reduction in interest had no bearing whatever on Exhibit No. 148 or on anything that I testified to. I think it had very little bearing on the subject of rate of return. I don't think it had any bearing on the subject of rate of return because, in effect, it would increase the equity earnings. Bank loans to gas companies today are governed more by the plethora of money in the banks. The amount of money in the banks has a great deal to do with the rate they ask for the notes. That has very little to do with the subject of rate of return to a company. I think it has very little effect on the final answer. I don't think it has anything to do with the subject of the determination of a fair rate of return for a company under regulation, except insofar as it is necessary to set it up in determining the entire amount of money invested in a company and the return shown thereon.

If I may explain directly to the Examiner, I have not undertaken to bring any of this data that I have shown up to the present stage. I have presented an exhibit as to the situation December 31, 1938, and I do not feel that it is incumbent on me to go through all of the records and bring up notations of this kind whether they affect the answer or not. Exhibit 148 deals entirely with 1938. May I add that Mr. Timberlake reminds me that data on one of the companies is given for 12 months to March 31, 1939.

There was only one issue of bonds of the Southern Natural Gas Company and there was one maturity date for the whole issue, but they were callable at different prices in different years. The maturity date is October 1, 1951. I don't think any of them matured in 1952. This record shows no such maturity and my memory does not recall any. When I say "this record", I mean my underlying work papers.

As of December 31, 1938 there were $1,409,000 of Alabama Gas Company, First Mortgage, 4½'s of 1951 outstanding. The report to the stockholders shows $1,385,000.

I do not know which is right. The report to the
1429 stockholders shows bank loans outstanding at December 31, 1938 of $1,475,000. This was a collateral note to the New York Trust Company at 4½ per cent. There were other bank and current liability notes to the extent of $188,838. It is about $100,000 different from the figure shown on our exhibit. I am not able now to explain why it is different.

Poor's Manual shows 1st mortgage 4½ per cent series due April 1, 1952, outstanding as of December 31, 1938, in the amount of $616,000, and that, together with the amount outstanding of the series due October, 1951, gives the total of $13,555,000 shown on page 5 of our Exhibit No. 148; so it appears there are two series maturing at two different dates in those 1st mortgage bonds shown on page 5 of our Exhibit No. 148. I think the exhibit does not show that. I have not mentioned that there were two series in my testimony. The information as to earnings and security prices was obtained from Moody's.

Southern natural is the company in which our firm has a substantial interest. I should know the facts about the Southern Natural Gas Company.

In my testimony on going concern value in the Syracuse Gas and Electric case before the New York Commission, I included as a part of the build-up of the figure of $4,000,000 finally arrived at there for going concern value, the fact that "the area now known as Syracuse was once the capital of the Great Iroquois Indian Confederacy." I made that statement. I also made the statement that "Syracuse is also possessed of a university ranking 22nd in size among the country's 700 similar institutions." The only use I made of my reference to the Indians around Syracuse and that the University of Syracuse was there, in discussing the going concern value, was that I drew a picture of the territory in which the company was operating. No consideration whatever was given to that element in arriving at my conclusion.

Cross-Examination by Mr. Booth.

On the question of reserves of the defendants, I indicated that one of the hazards in the minds of investors in determining the risk of investing in companies of this character is the question of failure of the reserves—that the gas will fail before the estimated life of the field. You ask whether or not that was one of the hazards I took into consideration in arriving at my conclusion as to what constitutes a proper rate of return for this company.

To answer that question I will have to explain that I did not make any definite allowance for hazards, and only took them into account to the extent that I satisfied myself that there were no greater hazards of exhaustion in the case of the average of these other companies than in the case of defendants.

Yes, I testified at page 5277: "The amount of gas available on which the life of the pipeline depends is bound to be known only to the extent of an estimate, the geologist's estimate which may be right and may not be." I made no independent investigation of the studies or reports that the geologists have made with respect to the life of the Panhandle field.

I have stated that I testified in the Chicago District Pipeline Company case on the subject of rate of return.

1430 I was not advised that J. D. Thompson, a geologist, testified as to the life of the reserves of the Panhandle field in this proceeding. I did not even know what he testified to in this case. I have no recollection that I was advised in the Chicago District Pipeline Company case that the same Thompson testified in 1934 that there was only a 12-year supply of natural gas in the Panhandle field. I am quite sure that I did not have that information. (Objection and motion to strike by company counsel overruled and denied.)

In the question propounded to me at page 5275 by Judge Morgan in which he asked me whether I had stated in my prior testimony that I was familiar with the natural gas business in all of its phases, I took his implication to refer to my firm rather than to me personally, as I had previously testified. I don't think I am familiar with the natural gas business in all of its phases. I would not claim to be personally.

I have made no investigation of the depreciation of the property of the two companies, except to the extent of Mr. Hill's trip at the beginning of our work. I did not make that trip, it was made by Mr. Hill.

I do not have an intimate knowledge of the element of fatigue as affecting the property of defendants. I have made no systematic inquiries to determine the effect of fatigue on their property. I have discussed it to some extent. I have made no study of fatigue.

I have made no independent investigation of the effect of the physical factors in connection with the operation of defendants' plants and property, except to the extent of Mr. Hill's observations.

Exhibit No. 130 constituted the basis of my conclusions on the subject of going concern value. Of the $8,568,000 shown on that exhibit, $4,859,896 constitutes the charges for interest on that portion of the capacity provided in advance of attached business.

1431 It was arrived at by taking certain proportions of the interest paid during 1932 to 1935, inclusive, due to the fact that the company had not utilized the full capacity of its line during each of those years. Yes, I know that the interest the company pays on its bonds is 6% per annum. Yes, if the interest rate on the bonds had been 12% instead of 6%, the interest instead of being $4,859,000 would have been twice that amount or approximately $9,750,000, and the going value which I found in this case would have been substantially greater under that assumption.

Yes, if in fact the ad valorem taxes of the company had been twice the amount $1,163,156 during 1930-1935, the item of ad valorem taxes constituting a portion of the going value which I found would have been as much as twice $396,000. Under those circumstances, naturally, the going concern value in this case based on this exhibit would have been affected. The item of depreciation was one of the principal factors entering into my conclusion on going value.

The figure I used for depreciation in that computation was taken from Mr. Biddison's conclusions as to the amount of observed depreciation. What I did was to allocate to those four years the proportionate parts of the total amount of existing depreciation determined by Mr. Biddison to have existed in the property of the company. I assumed that it took place uniformly year by year and assumed that Mr. Biddison's figures based on inspection were correct. I made no further independent inquiry on that point than I have stated here. If in fact the Commission should find that the existing depreciation of the property should be 20% as you suggest instead of 5% as found by Mr. Biddison, they would have to increase the amount for depreciation in my computation of going value about four times and the going value would have to be increased by the same amount.

Yes, the next item included in the exhibit as one of the elements going to going value was the expenses not affected by the volume of gas handled, in the amount of $3,499,037. In using those figures I assumed that the company was efficiently managed and operated. If it be assumed, as you suggest, that the company was not efficiently managed or operated and expenses of operations not affected by the volume of gas handled were substantially greater than those recorded on the company's books, and which I have used in this exhibit, that would have the effect of increasing the amount to be included for that item in the going concern value. However, I don't think that such a conclusion is justified here, for reason is applied to all such estimates. I did not make an independent investigation of these expenses to determine that they were in fact reasonable. I took the company's expenses for these classes of items as they were handed to me by the accounting officers of the company.

It is not true that if this study made in 1939 had been made in 1945, and it appeared that the lag which I found to exist between 1932 and 1935 had extended up through 1945, the going value in 1945 would be substantially greater. You inquire if the fundamental method I used in arriving at going value was the cost of soliciting business, of providing facilities, and of operating facilities in advance of the attachment of the substantially full and complete business of the company in 1936 and the substantially full operation of the company's facilities at the same time. I think that the going concern value of a business in this particular applies to the early years of a company's existence, when it is building up its business; and the rule of reason would have to apply as to how many years are taken. It has never been my practice to take over four or five years, although there may have been six in some cases; but it has been confined to that period when the business is getting going in motion.

1432 It is true that if in fact the company had attached fully and completely its business beginning in 1932 to the same extent that I found it had attached its business in 1936, there would have been no going concern value. If I were making this inquiry and found that defendants had failed to attach fully their business in 1939 I would have limited the period of development to a reasonable period. It is not true that I had in mind when I began this study of going concern value a figure of approximately $8,500,000 and that I searched around for this method to get this mathematical figure.

I did not know that Mr. Hamilton used the same method. I did not discuss my method with Mr. Hamilton. I have known Mr. Hamilton for many years. I knew he was employed on the valuation of the physical property. I really did not know that he had been called in on going concern value. I do not think I knew it until after his testimony was presented. Then I simply knew that he had testified. I never saw his testimony.

Cross-Examination by Mr. Slaff.

In my going concern value testimony in other cases, I have searched the records of companies in the past to determine the rate of build-up of their business in early years. In some cases, that has gone back forty or fifty years. I have checked the results in early years with actual results in recent years and may have used the actual rate of build-up so derived in determining the term of the build-up period. I do not remember whether or not I have had occasion to modify such figures in any particular instances.

I think that the questions and answers you read beginning at page 3284 of the record in the Public Service Company of New Jersey case correctly reflect my testimony to the effect that the build-up period arrived at was based partly on the history of a number of underlying companies in the system, the records for which were available, and also upon my own experience, and that the records to which I referred were of one company whose operations began in 1896, one in 1890, one in 1892, two in 1893, and another in 1891. I then added that as a matter of fact I had used the historical figures which I considered agreed with my experience.

I think that in the Syracuse Lighting Case I went back into the period 1884 to 1889 to determine the rate of build-up applicable to a company which was being theoretically reproduced about 1937. This is an electric company which handles no gas. I used those figures because they checked with my actual experience.

I have no doubt that in the Public Service of New Jersey case I used as the rate of build-up of the business for a company being theoretically reproduced in 1934, the rate I found actually existed in the period 1891 to 1896. I mean by this testimony that I used the actual costs incurred during the build-up period in the beginning, not the costs of the whole 40-year period. Yes, in those cases I assumed that at the time I was testifying the particular company's business would build up in just the same length of time as it did during the historical build-up period. However, I did check these figures with my actual experience of more recent times.

In the case of such an estimate, I think no one has
1433 any right to assume in a reproduction of business
that the groundwork of the business is already laid. It would be just like assuming that because the rock was blown out for a pole hole years ago, it would not have to be blown out again. I do not think of other assumptions used by me in those studies of going concern value that I wish to comment on at this time.

You ask me if it is not a fact that if the management of this company had, during the period 1932 to 1935, been less efficient and because of that lower efficiency the expenses not affected by the volume of gas handled had been greater than those reflected on page 1 of my Exhibit 130, my going concern value would have been greater than that at which I actually arrived. If your question means 3% less efficient, that is so. If it means an amount that would be palpable, it is not; but I cannot say where the line would be drawn. I have stated that the rule of reason would apply to such an estimate and if there was palpable inefficiency, account would be taken of it.

If the expenses during one of those years, 1933 for example, instead of being $835,000 had been $910,000 or $920,000, the going concern value would have been greater, unless the expenses had reached the point where in my judgment there was palpable inefficiency. I made no independent determination whether that item of unvarying operating expenses was proper or improper further than my acquaintance with the management.

Yes, for the year 1932, I had a figure of $1,072,759 for expenses not affected by the volume of gas handled. If I had found that same expense year by year for the years 1933, 1934, and 1935, I would have had a greater going concern value, subject to the limitation I included in my former answer and subject to the fact that I made no independent investigation.

Yes, I testified to going concern value in the Dayton case. I think there was considerable similarity in the nature of the testimony I gave in that case and that here. I do not know just the points of difference. In that case and here, there was no actual record and statement of the expenditures similar to this statement contained in Exhibit No. 130. Anything of that nature presented in the Dayton case would have been estimated. The general principles were the same, but I think a different consideration was given to the different elements at the time I testified in the Dayton case than I gave here.

The testimony on going concern value in the Columbus case was presented by another witness. I largely supervised the preparation of the testimony. Yes, the general principles underlying that testimony were the same as I used when I testified in the Dayton case, but there were differences in consideration of the various elements. Yes, those two cases went to the Supreme Court of the United States. I cannot vouch for the reference 292 U. S.

My testimony in the Syracuse case was before the New York Commission. The company's name is Syracuse Lighting Company and I testified two or three years ago. I have no doubt you are correctly stating my testimony in that case in reading from page 3416, in substance, that the rate base should be higher for a public service company which has the right to do business in what I consider the best part of the state for such a business. I assume that the question I answered there referred to going concern value. I would like to make an observation to the effect that in the preliminary cross-examination the specific question was put to me if I would include anything for those elements reflected on page 4792 of this record,
1434 and I said I would not. Regarding the case that extracts have been read from, at the time of presenting my testimony there I did believe, having in mind the

citations in the Indianapolis water case, that consideration should be given to the location of the property. Since then I have felt that that element should be disregarded in arriving at a figure, and I have not included anything for it.

That element would in no way affect my recognition of these costs that I have tabulated in Exhibit 130 relating to the provision of facilities in advance of attached business. It would not enter in any way in my recognition of these costs. The Indianapolis case was decided about 1925. You ask if, because they could make a higher profit in that portion of the state in which they were located than they could in any other portion of the state, they should have a higher rate base. Without having an opportunity to refresh my mind by reading the context of this quotation, that was the purport of my testimony in the Public Service Company case.

(November 6, 1939)

(At this point, counsel for the Commission handed the reporter a document described as a photostatic copy of facing sheet and pages 164, 165, and 167 of Poor's Public Utility Volume, 1939, with the request that it be marked for identification. At the direction of the Examiner the document was marked for identification as EXHIBIT NO. 168. The exhibit was offered and received in evidence without objection.

Counsel for the Commission then handed the reporter a document described as a photostatic copy of facing page and pages a-55 to a-61 of Moody's Manual of Investments, Public Utility Securities, for the year 1939 with the request that it be marked for identification. At the direction of the Examiner, such document was marked EXHIBIT NO. 169. The exhibit was offered and admitted in evidence over the objections of defendants who were allowed an exception.

Counsel for the Commission then presented to the reporter a document described as page 250 of the American Gas Association Monthly for July-August, 1939, with the request that it be marked for identification. At the direction of the Examiner, the document was marked Exhibit No. 170.

Counsel for the Commission next produced a document described as photostatic copies of pages 19, 20, and 37 of the magazine "Gas" for July, 1939, the same being an article "The Investment Attributes of Gas Utility Securities," by Percy S. Young, with the request that it be marked for identification. At the same time, counsel for the Commission stated that this was presumably the long article on which the summary in Exhibit 170 for identification was taken, in which article Mr. Young said: "The author is indebted to Dean John T. Madden and Dr. Herbert B. Dorau of New York University for statistical material recently prepared under their direction dealing with the experience of investors in public utility securities during recent years." At the direction of the Examiner, the document was marked Exhibit No. 171.

Counsel for the Commission handed to the reporter a document described as a photostatic copy of pages 251 and 252 of the July-August issue of the American Gas Association Monthly, an article "A Banker Analyzes Natural Gas Industry Investment Values" by Frank R. Den-
1435 ton, president of the Mellon Securities Corporation of Pittsburgh, Pennsylvania, with the request that it be marked for identification. At the direction of the Examiner, such document was marked Exhibit No. 172. EXHIBIT NO. 172 was offered and admitted in evidence over the objection of defendants who were allowed an exception.

Counsel for the Commission then handed the reporter a document described as a photostatic copy of pages 37, 38, and 43 of the magazine "Gas" for May 1939, an article entitled: "A Stock Broker Analyzes the Natural Gas Industry" by John Nickerson III, a partner of Winslow & Douglas, New York City, with the request that it be marked for identification. At the direction of the Examiner, the document was marked Exhibit No. 173. EXHIBIT 173 was offered and admitted in evidence over the objection of defendants who were allowed an exception.

Counsel for the Commission next produced a document described as a photostatic copy of pages 56 through 61 of "The Index" published quarterly by the New York Press Company, an article from the Autumn 1939 issue entitled "The Gas Industry," with the request that it be marked for identification. At the direction of the Examiner, the document was marked Exhibit No. 174. EXHIBIT 174 was offered and received in evidence over the objections of defendants who were allowed an exception.

Counsel for the Commission then produced a document described as a photostatic copy of page 66 of the August 1939 issue of the magazine "Gas," an article entitled: "Gas Air Conditioning Serves Dallas Office Building," with the request that it be marked for identification. At the direction of the Examiner, the document was marked Exhibit No. 175. EXHIBIT 175 was offered and admitted in evidence over the objection of the defendants who were allowed an exception.

Counsel for the Commission produced a document described as a photostatic copy of pages 253, 254, and 255 of the July-August 1939 issue of the American Gas Association Monthly, an article entitled: "Fifth Big Job, Air Conditioning, A Challenging Opportunity by Charles R. Bellamy, Columbia Gas and Electric Corporation, New York, New York, Chairman Industrial and Commercial Air-Conditioning Committee." At the direction of the Examiner, the document was marked Exhibit No. 176. EXHIBIT 176 was offered and admitted in evidence over the objection of defendants who were allowed an exception.

Counsel for the Commission produced a document described as page 27 of the September 14, 1939 "Gas Age," the first page of an article entitled "Coordinated Effort Needed in House Heating," by Walter C. Beckjord, vice president and general manager, Columbia Gas and Electric Corporation, stating he had been identified in the record as the present president of the American Gas Association. At the direction of the Examiner, the document was marked Exhibit No. 177. EXHIBIT 177 was offered and received in evidence over the objection of defendants who were allowed an exception.

Counsel for the Commission produced a document described as photostatic copy of pages 24 and 33 of the magazine "Gas" for January, 1939, being an article entitled "The Natural Gas Industry Provides Opportunities for Investment" by James S. Carroll, with the request that it be marked for identification. At the direction of the Examiner, the document was marked Exhibit No. 178 for identification. EXHIBIT 178 was offered and received in evidence over the objection of defendants who were allowed an exception.

Counsel for the Commission produced a document described as "Annual Statistics of the Natural Gas Industry in 1938, Statistical Bulletin No. 37, October, 1939" by
Paul Ryan, chief statistician of the American Gas
1436 Association. At the direction of the Examiner, the
document was marked Exhibit 179. Statistics such as contained in Exhibit 179 have to be cooperative and voluntary because there are some elements in the industry who are not even under membership compulsion; I am not

sure of the percentage; such statistics are prepared as the usual trade association statistics are gathered, using all the devices at its command; but such an association does not have the compulsion, such as Federal Power Commission has, when it asks a company to make a report. I believe that these statistics obtain general acceptance in the industry as overall statistics. I doubt whether there is any other agency which goes to the same trouble in gathering as comprehensive statistics. In the census of manufacturers, attention has been given to the gas industry, but that such reports are not very satisfactory because the units they use are of infrequent intervals, and they do not view it as a utility in any sense; they are usually reporting on the matter as a resource situation for which reason the material is not very useful.

(EXHIBIT 179 was offered and received in evidence over the objection of defendants, who were allowed an exception.

EXHIBIT NO. 154 was offered and received in evidence over the objection of defendants who were allowed an exception.

EXHIBITS 170 and 171 were offered and received in evidence over the objection of defendants who were allowed an exception.)

1437 H. B. DORAU, a witness for defendants, recalled for further cross-examination, testified:

Cross-Examination by Mr. Slaff.

(November 6, 1939.)

I think I stated in my direct testimony that Moody's assumed to rate only 32 out of 87 natural gas bonds, leaving 55 issues unrated. I think I pointed out in subsequent testimony that that left only a certain number to be analyzed as to how they were rated; and I think it was implied that the non-availability of any such observation with respect to such a large proportion did not leave the investor much opportunity to benefit by such observations with respect to those. I think I said in subsequent explanation that I considered it more important as to how those 32 issues were rated.

I considered the investor as not having access to the final opinion of a rating agency with respect to those issues not rated. There are apparently various reasons why final opinion of a rating agency with respect to those issues not rated. There are apparently various reasons why those issues were not rated. I think the reason the Natural Gas Pipeline Company of America's bonds are not rated by Moody's is that it has no securities publicly outstanding. The same reason applies to the bonds of Texoma Natural Gas Company, and to those of Northern Natural Gas Company.

It is possible that you are right in suggesting that 17 of these unrated issues were unrated because not publicly held. I did not count those companies. I was not giving particular attention to that group. I think it is a rather important consideration as to why they are unrated. There are other reasons applying to some of these issues than that they are not held by the public. As to those which are privately held, that fact would probably be the determining factor. There might well be other reasons in some situations. I did not mention that in my direct testimony. I had it in mind. I think it was the reason why I made the observation I did subsequently. The observation of which I speak, as I remember it, follows the testimony where I gave the number that are given different ratings. I think I made a statement to the effect that what was of more significance is the rating actually given those bonds which were actually found to have been given ratings. I cannot refer you to the page of the record. I am speaking from memory. I cannot find it in the record here. I certainly had it in mind. I say it should have been made if it was not.

I did not intend any particular implication in stating the over-all number. I was merely recording for the record the number, and that was in order to give some basis of comparison for the number that we actually dealt with. I do not have in mind those issues not rated because they are privately held. I made no attempt to memorize the particular issues because after having eliminated those which have no rating, I gave special attention to the others. I am willing to supply the information if you would like to have it.

The Examiner reminds me that I was to give the names of the two companies whose bonds were listed as Aaa. I think that was supplied to Mr. Slaff or Mr. Booth. In my statement shown at page 5676 of the record, in which I stated that I was convinced that people will receive service at a lower price under certain circumstances when we rely on the disposition and willingness of enterprising capitalists to take the chance than they would otherwise, I
1438 was not referring to the utility industry as a whole.

I think I meant properly to restrict the observation when I said "under certain circumstances". The circumstance that I believe would be important to consider there is that when there is a very considerable degree of risk present in an industry, the effort of putting it on a fixed or cost basis, so to speak, probably results in a higher over-all cost, because we are not taking advantage of the disposition of people to take the chances of getting 10 or 15 or 20% even, under conditions where the average return is probably 4 or 6 or 10%.

Calling my attention to my statement in my direct testimony that "there are conditions where a regulated industry actually develops a higher cost of capital than an unregulated industry," you ask what unregulated industries today are experiencing a lower cost of capital than say the telephone industry in the United States. I do not know. I have not made any statistical studies. You ask what unregulated industry is today experiencing a lower rate of capital than the electric industry. I have not made any such statistical study. You ask what fact I had in mind back of that general observation of principle. I had in mind the facts as to the conditions under which people are willing to employ their funds, a fact of human behavior that has been noticed over long periods of time. I made no statistical studies to attempt to prove that general observation at the present time. It was not intended to be based on any such statistical studies.

I made no statistical studies to support my statement that it is not an unusual observation at all to note that an industry where there is the largest chance of gain, actually averages out with the lowest cost of capital. I do not know that that principle has been statistically measured as such. I made no such observations, but I would like to add there that I am merely putting in summary form a principle which is common in the literature of economics from Adam Smith down. I think I quoted from that authority at this point in the direct. You ask me whether or not my discussion of this industry and the force of the Adam Smith doctrines and similar doctrines in relation to it necessarily embrace the free play of competition. My answer is yes, in large part, with respect to these bargains that have to be made in the competitive area. This is an inductive operation. It is a principle. I believe it is a principle. It is my opinion. I made no statistical studies to demonstrate the application of this Adam Smith principle to any present day facts. It was simply an observation of an old principle of the disposition of human beings to take a chance and they are willing to do it even with a lower return, and that is not capitalized on fully when you fix a rigid ceiling for their expectations. As I said before, I made no statistical studies to back up this principle.

You asked me whether or not from my observations of the electric industry as a whole, I think the people would receive service at a lower price if we rely upon the disposition and willingness of enterprising capitalists to take a chance than if we had relied, as in the past, 20 years or more, on regulation. Undoubtedly in the early period of the industry, they would not have received it at lower prices. In the late periods after understanding the principles of management and operation as they became more common, I am not so certain.

You ask me if I am familiar with the New Jersey situation. There are aspects of it that I understand quite well. You ask me if I concede that today rates are lower in New Jersey because of the presence of a regulatory commission than if there had been no commission with authority to regulate electric rates. I could not say as to that. That covers an awful lot of territory. There are other alternatives that I have in mind which you probably may not have. I was still thinking of the Public Service of New Jersey. I am not in position to say what would be the fact if there had been no public service commission in New Jersey since 1911. I am not certain but that circumstances might not be more favorable. One of the things I had in
1439 mind, of course, as an earlier alternative was municipal competition. I have also other considerations in mind which I really do not want to proffer, so I really say that I am not certain. I would hate to go on record with a categorical answer in that particular instance. You ask me whether I think that rates would have been lower in New York City if there had been no public service commission in New York since 1907 or 1908. I am quite certain that the top rates in the electric field would not be as low as they are now. I am very certain of that. I am equally uncertain as to what might be the willingness of the company to lower the price of larger volumes of consumption if the circumstances were different.

No, I do not think that the rates would be lower in Washington without the pressure of the so-called Washington Plan, because the attractive feature about the Washington Plan bearing upon this particular principle is that it does hold out some chance of sharing. I believe it is true that the company in Washington had to be forced by the pressure of regulatory process into acquiescing to that plan of regulation, and I will say that the really attractive feature of that plan is that it offers some opportunity for sharing as an inducement. The fixed rate base is another matter which the plan offers as an attractive feature. I do not associate it with the question of inducement in marketing the securities as intimately as that. I think I have long recognized that one good argument for a fixed cost rate base or something of that sort is the administratability aspect. That does not mean that there are not other arguments against it. I have long recognized that it has more administratability. (Objection by Company Counsel overruled.) I do not subscribe to your suggestion that given administratability and given inducement to the utility under regulation, you then have a thoroughly workable plan of utility regulation.

The plan has been in effect in Washington since 1925. These 15 years have been years of very good times here in Washington from the statistics I have seen. When other things turned bad, the gains of consumption and of customers looked very good in Washington. I remember looking at some telephone statistics and found that the telephone service in this area went counter to the trend in the rest of the country. I think you have an unusual situation here. You ask whether or not it has worked in the two fundamental aspects in which regulation should work according to my conception, that is, in lowering the cost of service to consumers, and increasing profits to the investor. Yes, under the unusual conditions prevailing here and under the unusual sequence of circumstances since the inception of the plan. I do not understand that the people who are probably moderately well satisfied with it would necessarily recommend it for employment in other communities. No, I have not discussed it with the commission here in Washington. I do not suppose they would recommend it for other communities—I mean outside. I am willing to say very frankly that I am personally not convinced that it is something that could be transplanted successfully to Milwaukee, Wisconsin or Minneapolis or Des Moines, Iowa. I think its very attractive feature is that of holding out inducement to the investor or to the management of the enterprise. If that feature were in it, it would presumably be common to all places.

It is my recollection that the companies which invested their money in defendants' enterprise had had some experience in the natural gas industry. They include the

Cities Service Company, Standard Oil Company, Southwestern Development Company, Phillips, Skelly. I am of the opinion that all of these participants had had previous experience in the natural gas industry. I think I said on cross-examination that Henry L. Doherty and Samuel Insull were examples of the individuals directing the destinies of these corporate entrepreneurs with respect to this enterprise.

1440 I rather doubt whether Mr. Doherty, at the time he was putting his money into this enterprise, pulled down Jordan on Investments or Lagerquist on Investments to find out whether he ought to put his money up or not. I do not mean to imply that he probably was not acquainted with what was there. No, I do not believe that Mr. Samuel Insull consulted Chamberlain in order to determine whether Peoples Gas Light and Coke Company and the other utilities with which he was connected should go into this enterprise; but he probably had some of his brain trust looking into that sort of thing, and probably Halsey Stuart were telling him what the possibilities of financing an enterprise of that sort were. I rather doubt whether in 1930 they were consulting books that had been published in 1911 to determine whether they should go into this enterprise. It is purely speculative as to whether they consulted any of those authorities you mention; but since a number of people who were in this organization had been students and subjected to that sort of thing, I should not be surprised if it reflected itself somewhat.

In putting in Exhibit 151, I was thinking more definitely of the investor who never had any experience in the natural gas business than I was of those who had had an extended direct experience. I think an informed investor might well have looked at what such treatises have to say on the natural gas industry, even though he were well informed with respect to other industries. I never made any investigation to determine whether those books were in the Cities Service library. It has a good library and I expect that they probably would be there. Mr. Doherty probably would not have taken this book out some time in 1930. If anyone took it out, it would have been done by someone else for him. I think the volume by Lagerquist was published in 1924. I recall reading a sentence or two from page 390 of that work. I do not have a copy of the exhibit here. He said there that the "proof of the rapid diminution of natural gas is evidenced by the fact that five times the quantity of natural gas was used in 1888 as in the last ten years." I do not consider the statement you have read significant. I did not analyze it and I did not check it to determine what ten years he was talking about. Yes, I looked at what I had copied out of Lagerquist. I did not note that it appears to be based on a special report of the U. S. Census of Mines and Quarries for the year 1902. I think the reference in the context there probably indicates he was making comparison between two periods.

If I was interested for a special purpose in what had happened in the earlier era of the industry, I would use the U. S. Census of Mines and Quarries for such purpose. No, I would not use it for determining the hazard in the industry today. I would not use it in determining what rate of return would tempt an investor today, except insofar as the past experience might be a guide to the future.

An investor in 1939 or 1930, judging the hazards of the natural gas industry from such point, would not rely particularly on the facts disclosed in a census report of 1902, except as that report might disclose the past and give him some basis of judgment for the future. I think an instance like the history of the pipeline built to Chicago prior to 1902, undoubtedly would throw quite a scare into him. I do not know whether the 1902 Census of Mines and Quarries referred to that pipeline. It probably did not because the census is probably primarily statistical. It is not historical in nature.

I put in evidence page 506 of Kirshman's work. I
1441 have no recollection that there is anything closely related to the subject appearing in pages 507 and 508 of the same work. It is well understood that after 1900 gas became more and more recognized as a medium of heat, fuel, and power. I think also that the language from Kirshman to the effect that "for these purposes it possesses many advantages. It is convenient to use, clean, it leaves no residue and is ready for instantaneous use at full heat capacity and may be suddenly extinguished," is of importance in this discussion. I considered it so obvious and so well known that it was not necessary to reproduce that from Kirshman. I did not reproduce the language you read from Kirshman to the effect that, "displaced from its present position for three-quarters of a century as the best means of lighting the home, gas has now become a greater necessity for heat in the home and for industrial purposes." The reason I did not reproduce it, as I remember it, was that when I came to the end of that other page there, the discussion seems to become more general and I

did not think it worthwhile to reproduce it. I think the statements are all right.

You read a statement that: "Gas for heating is in no danger of being supplanted by electricity, but even if electricity could be made a hundred per cent perfect for heating purposes, gas would still be more economical." I do not think that the facts there related are obvious. In fact, I do not know that they are true. I would state the situation quite differently from Kirshman. It was not true in my kitchen. Gas was supplanted. I have no objection to the statements contained on pages 507 and 508 of Kirshman. What was on those pages did not seem to add very much and I did not include them. I think the statements might have been added as an interesting comment. In the interest of economy, I did not extend that exhibit any further than seemed necessary. I am not saying that it is in the interest of economy to leave out the good things about the gas industry.

When I read into the record certain lines from Badger and Guthmann, it may be that I left out the first two sentences on page 486 of that work. If I recall correctly, the lines and portions that were desired in the record were suggested to me. I would have been willing to read the whole thing if you wanted the whole thing in. Whatever suggestion was made, was made right here in the hearing, while I was on the witness stand.

Certain portions of Exhibit 151[illegible]ere marked up, but those marks were placed there in the course of examining the volumes and when they were turned in for photostating, the marks were left there. That probably explains my hesitancy in reading, because the marked portions were construed to have a significance which they did not have.

I believe that on page 486 of the Badger and Guthmann work appears the language: "In summary it may be said that the gas industry has survived the severe crisis presented by the rapid development of the electric industry and now appears to be in a satisfactory condition. Consequently, the securities of properly managed gas companies may be considered as conservative investments."

(At this point the Examiner pointed out that further down on the same page appears the language: "Outside of one or two small subsidiary companies, no manufactured gas properties of any magnitude or importance are now in the hands of receivers;" and that the author then went on to say: "The greatly increased availability
1442 of natural gas at low prices in recent years has done

much to enhance the position of this branch of the industry''.)

To the best of my recollection, I read from Jordan on Investments that ''the cost of the construction and operation of long distance pipelines, however, largely offsets the basic saving in production costs.'' You ask me about that statement as one of fact. If the natural gas resources that are in Texas were available at the outskirts of Chicago the very substantial cost of transportation would be saved. You ask me what I know about how much the cost of construction and operation of long distance pipelines offsets basic savings in production cost. If you buy the gas for 4c or 5c in the field and it is necessary to sell it for 25c at the point of delivery, the cost of operation and cost of the investment in achieving that change in place is certainly responsible for a substantial change in the cost.

I think it might be assumed that the author quoted was comparing the production cost of natural gas with the production cost of manufactured gas and that he was saying that the cost of construction and operation of long distance pipelines for natural gas largely offsets the basic saving in production cost of natural gas when compared to the production cost of manufactured gas. Assuming the cost of manufactured gas at 35 cents a thousand cubic feet and assuming that it costs 25 cents to bring natural gas to your market against the 4-cent price in the field, that is probably a substantial offset. I do not think 35 cents for the bare production cost figure for manufactured gas is an absurd assumption. I made no calculation with respect to how much of the basic saving in the production cost is in the case of defendants offset by a cost of construction and operation of the pipeline. I think I know enough about it to agree that to a substantial extent, the savings are offset by the cost of transportation. I believe it is a self-evident fact that it costs mony to transport gas from Texas to Chicago.

I think I testified as shown by the record at page 5741 that if there is an intervention of a contractual relationship between two separate enterprises engaged in various stages of producing and marketing a product, whose interests are not in common in the matter, there still remains a grave economic hazard, namely, that if the terms of that contract turn out to be other than what is bearable under the economic conditions disclosed, such a contract is not construed to be very much of an economic protection, and it is very likely to be modified to conform to the economic possibilities of the situation. I was talking about a situation and not about the particular contract of defendants. I think it is a rather strikingly parallel circumstance to that of defendants.

In using the illustration of "the blades of pincers" at page 5745, I simply thought it the more dramatic way of reflecting the fact that the income is the difference between the revenue and the costs, and that the difference may result from a variety of changes. They may both be going up, both be going down, or both turning in, or both turning out. I had no insidious implication of any sort in that illustration.

I don't remember the name of the report which I read some months ago on the conservation policies in the State of Texas. I think I could supply it from my record
1443 of things that I read. In connection with my consideration of that point, I gave some thought to the possibility that other fields might be discovered or might be in existence which might tie into this pipeline when the Texas Panhandle is exhausted. I considered particularly the possibility that there might be a field closer to Chicago which would make a portion of the pipeline useless. That would mean an embarrassing supply of gas made available to Chicago. I think when I considered the possibility of other sources of supply, I also considered in that connection the fact that such other sources of supply might be the basis of a competitive supply. I considered as a possibility the fact that another source of supply might be available to defendants after the Texas Panhandle field was exhausted, so that it could continue in business after the Panhandle was exhausted.

I don't think I could characterize the consideration that I gave to that last suggestion in terms of weight. When I thought of the possibilities, I would take a look at the indicated fields and the areas that they appeared to cover; and it did not seem very probable that in that general area from which this pipeline came there would be additional areas between the Otis field, the Hugoton field, and the Panhandle, they seem to have pretty well explored the possibilities down there. The possibility of Nebraska and other portions of Texas is another matter.

I assumed that the probability of exhaustion constituted a hazard which the investment in this pipeline ought to face. I did not assume that the companies' business would end with the exhaustion of the Texas Panhandle field. I assumed that the probability of that happening was an important hazard in this undertaking.

At page 5754, I stated in substance that with reference to the possibility of a common purchaser statute, I had considered that possibility as one of the hazards. I appreciate the indirect possible consequences of a common purchaser statute. In that connection, I considered that it might tend to lessen waste.

I did not make a nine or ten months' comparison of the revenues of this company during 1939 with the corresponding months for the year 1938. I am under the impression that the revenues are improving. At the moment, I think an investor would be impressed with whether the short-term trend was up or down. One short period would probably be as significant as another. According to my recollection, I was not asked to compare the revenues of 1939 with the 1938 revenues for similar periods. My volunteering has been considerable restricted here. I do not mean that the Examiner has restricted me, but the manner of conducting such a hearing necessarily restricts a witness from saying everything he might want to.

I find that on page 5780, beginning at line 17, I discussed the falling off of revenues between 1937 and 1938 and gave substantially the same type of answer as with respect to the comparison of 1938 and 1939. I added that I thought that merely looking at one year's decline is not adequate for an investment judgment. I thought I said something to that effect.

At page 5788, I made the statement that the competition which natural gas finds itself in with such fuels as fuel oil and distillate and coal and things of that sort, is a factor to be taken into account with a company 40% of whose gas is sold for industrial purposes; that any change in the relative position of competitive service or competitive fuels ought to be taken into consideration; that any
1444 change in the relative position of such competitive fuels would have the same effect that the introduction of a directly competitive line would have; and that is that a loss of any substantial portion of the business due to the relatively more favorable price of oil or coal would reduce the volume, and that volume is apparently very significant for this particular enterprise. My statement there, "any change in the relative position of competitive service or competitive fuel", is a trifle broad. The change of course would have to be downward. I think, however, that is implicit in my answer. Naturally, the price of gas must remain the same. A change upward in the price of coal or oil would improve the position of natural gas and would

be appropriately considered. I am quite aware that there are some industrial applications where natural gas has unique characteristics and where the question of oil or coal is not a major factor.

Cross-Examination Interposed by Mr. Booth.

I examined the coal and oil prices, but did not attempt to make any comparison to determine at what price coal would have to sell in the Chicago area for industrial purposes in order to put it on a competitive basis with natural gas sold by this company for industrial purposes, because the price varies with the application most certainly and I do not think you could generalize it. I do not know at what price coal would have to sell for a particular use. I don't think you can generalize that. I looked up the price of coal at some time during the course of my studies but I did not attempt to equate them.

Cross-Examination by Mr. Slaff Resumed.

No, I do not know how much of a change there would have to be in the price of those competitive fuels before it would have any competitive effect on the sale of natural gas for industrial uses in those fields where there is that competition. I realize that the actual determination is a matter of the application under specific conditions, as the use of electricity and gas for example. It cannot be determined on a heat unit basis competitively.

At page 5791, I stated that I believed in building a solid foundation in the most fundamental factors and working up from those to the more immediately and directly observable applicable evidences.

I considered the background of the ideas that I was trying to develop as of that fundamental character. I merely meant to distinguish between the underlying considerations and the more obvious evidences such as would be displayed by the price of securities in the market. I think the question of the solidity of the fundamental factors is a limited term and relates to what a person can say in a limited time. I would invite you to come up to the course for a year and see what we could do.

VOLUME IV.

TRANSCRIPT OF RECORD

SUPREME COURT OF THE UNITED STATES

October Term, 1941

No. 265

FEDERAL POWER COMMISSION AND ILLINOIS COMMERCE COMMISSION, PETITIONERS

vs.

NATURAL GAS PIPELINE COMPANY OF AMERICA AND TEXOMA NATURAL GAS COMPANY

No. 268

NATURAL GAS PIPELINE COMPANY OF AMERICA AND TEXOMA NATURAL GAS COMPANY, PETITIONERS

vs.

FEDERAL POWER COMMISSION AND ILLINOIS COMMERCE COMMISSION

ON WRITS OF CERTIORARI TO THE UNITED STATES CIRCUIT COURT OF APPEALS FOR THE SEVENTH CIRCUIT

Petitions for certiorari filed July 12, 1941, July 14, 1941

Certiorari granted October 13, 1941

IN THE

United States Circuit Court of Appeals
For the Seventh Circuit

No. 7454

NATURAL GAS PIPELINE COMPANY OF AMERICA
AND TEXOMA NATURAL GAS COMPANY,
Petitioners,
vs.
FEDERAL POWER COMMISSION AND ILLINOIS
COMMERCE COMMISSION,
Respondents.

Petition for Review of Interim Order of the Federal Power Commission.

INDEX.

Petition of the Illinois Commerce Commission, filed with the Federal Power Commission, September 23, 1938 1
Order of Federal Power Commission instituting Investigation, entered October 14, 1938.......... 6
Answer of Natural Gas Pipeline Company of America and Texoma Natural Gas Company to Petition, filed November 16, 1938.......... 9
Order fixing date of hearing, entered April 14, 1939... 13

PROCEEDINGS AT HEARING.

Statement by Examiner.......... 15
Statement by Mr. Morgan.......... 16
Colloquy 25, 33, 64
Statement by Mr. Booth.......... 28
Statement by Mr. May.......... 31

ABSTRACT OF TESTIMONY.

Witnesses for Federal Power Commission.

Testimony of:

Brown, Claude C..........35, 36
Knapp, Charles W., Jr..........2004, 2103, 2588
Smith, Charles W..........2041, 2222, 2632

Witnesses for Illinois Commerce Commission.

Testimony of:

Kleinman, Fred 2075, 2382
Ostrander, E. D..........1977, 2277
Woodford, John M..........57, 393

Vol. I, pp. 1 to 646; Vol. II, pp. 647 to 1310; Vol. III, pp. 1311 to 1976; Vol. IV, pp. 1977 to 2672; Vol. V, pp. 2673 to 3031; Vol. VI, pp. 3033 to 3417; Vol. VII, pp. 3419 to 3902; Vol. VIII, pp. 3903 to 4023.

WITNESSES FOR DEFENDANTS.

Testimony of:

Biddison, P. McDonald 1041, 1284
Brainard, W. F. 481
Brown, Floyd C. 491, 1311, 1636
Bulla, W. T. 987
Bussard, R. M. 715, 854, 1056
Campbell, S. E. 1003, 1398, 2554, 2637
Cooke, John A. 1446, 1909, 2616, 2669
Cottingham, V. E. 187
Davidson G. M. 1013, 1040, 1068, 1142
Davidson, W. H. 815

1445 **E. D. OSTRANDER**, a witness for complainant, Illinois Commerce Commission, testified:

(November 6, 1939.)

Direct Examination by Mr. Booth.

My name is E. D. Ostrander. I live in Evanston, Illinois, and I am supervisor of the Rates and Research Section of the Illinois Commerce Commission.

My academic training included a degree of Bachelor of Science from the Kansas State Teachers College, Emporia, Kansas, and a degree of Master of Arts from the University of Chicago. I subsequently took some graduate work in public utilities at Northwestern University. My academic training was in accounting, statistics, mathematics, finance, money and banking, economics, public utilities and similar fields.

In 1929 and 1930, I spent a year with the Investment Research Corporation of America at Detroit, Michigan, as an assistant to Dr. Lionel D. Edie, the Corporation's economist. That organization performed an investment and economic advisory service for a group of investment trusts. My work with the firm covered statistical and economic research with regard to many phases of business activity including particularly studies of corporate profits, price-earnings ratios and relationships, statistical curve fitting, index number construction, statistical corrections of data for seasonal variation and so forth.

During the latter part of 1930 and the first part of 1931, I spent about six months with James O. McKinsey and Company of Chicago, a firm of business engineers and public accountants. My work with this firm was primarily public accounting.

In May of 1931 I went with the firm of Emery, Peck and Rockwood Company of Chicago, investment bankers, and was with that house and its successor until coming with the Illinois Commerce Commission in October of 1933. My work with the investment house included the preparation of prospectuses and sales memoranda, the study of indentures and other agreements, investment counsel work, and a number of routine duties such as keeping books for two small hydro-electric projects, including negotiations with trustees in regard to interest and principal payments, insurance policies and so on.

I have been employed by the Illinois Commerce Commission since October, 1933. In general my work with the Commission has been of a research character, but in a number of different fields. Included among these are statistical studies of the revenues of Illinois public utilities, rate analyses and comparisons, studies in relation to accounting and statistical procedure and reports of the utilities, research in connection with the problem of fair rate of return, studies in regard to cost of money, economic conditions, and various statistical and financial problems for the Commission.

1446 I have testified in several cases before the Illinois Commerce Commission. In Docket No. 23[illegible]15, a citation against Peoria Water Works Company to show cause why its rates for water service should not be reduced, I presented testimony in regard to the cost of money to the company. In Docket No. 22337, an electric rate citation involving Commonwealth Edison Company, I presented testimony with respect to the company's intercorporate relations, cost of money, the relief situation in Illinois, and some statistical computations in regard to working capital. In Dockets No. 23780 and 24792 involving applications by the Peoples Gas Light and Coke Company for an increase in rates, I presented testimony in regard to cost of money to the company, trends of interest rates and bond yields, the effect of billing methods upon the investment in operating expenses, and data in regard to public utility financing in recent years. In several other cases involving applications by utilities for rate increases after the enactment of the public utility tax act, I presented testimony in regard to the unemployment relief problem in Illinois.

In March, 1938, I testified before the Public Utilities Commission of Ohio as a witness on behalf of the City of Cleveland in a proceeding entitled "East Ohio Gas Company *vs.* Cleveland," which involved rates for gas service in the City of Cleveland furnished by East Ohio Gas Company. My testimony in this instance dealt with the problem of cost of money to Standard Oil Company, the parent company of East Ohio Gas Company.

During the past few years I have written certain articles in regard to public utility financing. During the years 1936 to 1938, inclusive, I prepared quarterly a review of public utility financing that was published quarterly by the Journal of Land and Public Utility Economics. I also prepared for the same journal a summary of public utility financing from 1919 to 1935. The article last mentioned dealt principally with the revision and computation of an index number of the volume of public utility financing.

I have prepared some material with respect to trends of interest rates and bond yields and have put that material into the form of an exhibit.

(At this point counsel for complainant produced a document entitled "Trends of Interest Rates and Bond Yields" with the request that it be marked for identification. At the direction of the Examiner the document was marked Exhibit 180.)

My exhibit has been marked Exhibit 180. Page 1 of this exhibit presents the trends of interest rates from 1923 down through the first eight months of 1939 for four different kinds of short term loans. The first kind is prime commercial paper of 4 to 6 months maturities. In the column under that heading I indicate the range during the year or month, as the case may be.

The second column shows similar ranges of rates of interest for prime bankers' acceptances for 90-day maturities.

The third column of figures represents the interest rates on 90-day stock exchange time loans.

1447 Finally, the column on the right hand side of the first page indicates the interest rates of stock exchange call loans, which, I should say, are the rates for renewals of call loans rather than new call loans.

The source of the information is indicated in a footnote at the bottom of page 1, and I believe that is true for the other pages of the exhibit. The material is obtained from the annual reports and monthly bulletins of the Board of Governors of the Federal Reserve System, which is generally recognized as an authority of source for material of this character for people working in the field of financial statistics and interest data. I would not say that they are infallible, but I would say that it is generally recognized as a very good source of financial data.

Page 2 presents the trend of interest rates charged customers by banks in the principal cities. The period is from 1919 to February, 1939. No later information is shown because this series has been discontinued. The Federal Reserve Board has announced that it expects to prepare and publish a slightly revised series in due course. The cities involved with respect to the information on page 2 are indicated on page 3 of the Exhibit. Interest rates charged by banks with respect to loans made to their customers are shown here for New York City, also for 8 other northern and eastern cities, and finally for 27 southern and western cities.

Page 4 of this exhibit simply set forth the trend during the last 10 or 12 years in the discount rate of the New York and Chicago Federal Reserve Banks. This discount rate is the rate charged by the Federal Reserve Banks for certain advances or loans made to the member banks.

On page 5 of the exhibit, the trend of average yields on long term federal and municipal bonds is given for the period from 1919 until August, 1939. The first column of the percentage figures is headed "United States Government." That refers to the average yield on long term Federal bond issues.

The second column of percentage figures—incidentally I just now note that it is not indicated as percentage, but opposite the year 1919, the figure of 4.46 should be indicated as per cent. In all events, those figures there are for 15 high grade municipal bonds as computed by the Standard Statistics Company. I believe in the Standard Trade and Securities Service, Volume 3, Statistical Section, there may be a list of those 15 bonds. I have not specifically checked it up, but that is the place where they give most of their statistical series, and in most cases I know that they indicate the list of bonds, stocks, or whatever it is that they use in their various averages and indices. I would hardly think that the 15 bonds remain uniform. I believe the list is confined to the United States Treasury bonds of maturities of 8 years or more. In other words, that is about their definition of "long term." It represents the average of the yields of such United States Government bonds as happen to be outstanding, meeting those qualifications, and, as I understand it also, they compute the yield to the first call date rather than to the nominal maturity of those obligations. The average set out represents the average yield of those outstanding during the particular month. It does not relate to new issues.

1448 On page 6, the average yield on 10 high grade railroad bonds as computed by The Annalist is given for the period from 1857 to August, 1939. As indicated by the footnote there, the number of bonds in that average was reduced from 10 to 7 beginning with 1939. Otherwise I think this page with the note given at the bottom is self explanatory. The purpose of it is to present the longer term picture of yields on what have been considered fairly high grade type of long term corporate bonds. The Annalist for a number of years made considerable use of this average in its weekly chart on economic conditions. Last spring—I do not have the exact citation at the moment—but last spring The Annalist computed a new series of high grade bond yields based upon the average yield of 10 high grade public utility bonds and indicated their intention of using that in their chart on economic conditions. Whether or not they actually followed through with their intention as to the use of that new series, I can not at the moment say, but at all events I have indicated on page 7 this new series prepared by The Annalist, namely, the average yields of 10 high grade public utility bonds. The series was of course computed back for a number of years. Specifically, I say here back through 1929, so the information on page 7 carried through from 1929 to August of 1939.

Cross-Examination Interposed by Mr. Morgan.

As to why the number of issues was reduced in the list above referred to, my own feeling is that the number of high grade bonds available probably has been reduced. In order to get a good sample which would avoid bonds selling above the call price and so on, they probably had to reduce the number. Of course there are a great many more issues of railroad bonds than seven in the year 1939. The same thing was done by Moody's Investors Service in its average ~~of the~~ yields of high grade bonds. For example, Moody's published the average yields of 10 high grade Aaa railroad bonds, 10 high grade Aaa public utility bonds, and 10 high grade Aaa industrial bonds. In the case of industrial Aaa bonds used by Moody, nominally there are supposed to be 10 bonds in that average, but they have only actually somewhere from three to five.

Direct Examination by Mr. Booth Resumed.

As I recall it, Dr. Dorau in his exhibit presents the Moody bond averages. I have examined his tables.

Finally on page 8 of this exhibit, the bond yield averages of domestic corporation bonds, as computed by the Standard Statistics Company, for public utility, railroad, and industrial bonds are presented. In the case of each of these three industrial groupings, six rating groups are shown, that is, A-1 plus, A-1, A, B-1 plus, B-1, and B rating groups are shown for each of the three major industrial classifications.

The data here are for the period 1925 to October, 1939. The information for October, 1939, is really based upon bond prices as of about September 20th. All prices are as of about the 20th of the preceding month, as given in the footnote on page 8. I cannot say definitely whether a weighted average or an arithmetic average was used here.

I think that about covers this exhibit. The general purpose of this exhibit is to show trends of interest rates and yields on both short term and long term loans of various kinds. The latest available data where used is as of the time the exhibit was prepared.

1449 You ask me to state briefly what the results are generally since the month of August in connection with the trends of bond yields as shown in the exhibit insofar as the data is now available. Broadly speaking, beginning about September 1st when the European War broke out, high grade long term bond prices declined fairly sharply for about three weeks. The bottom was reached along about the 20th, 21st or 23rd of September, when, of course, with prices falling, yields went up accordingly. The trend since about the end of the third week of September has been slightly upward, and a substantial part of the drop has since then recovered.

Speaking specifically with reference to this exhibit, I do have at this time some later information. With regard to page 1, the range of rates on commercial paper for September was from 5/8ths to 3/4, thus indicating a slight increase over August. As of about October 14th, based upon the weekly figures, there was published figures of from 5/8 to 1 per cent by the Commercial and Financial Chronicle. I think that was the week ended October 14th, if I recall correctly. The rate for prime bankers acceptances did not change in September. The same is also true of the rate of interest of 90-day time loans, and on the Stock Exchange renewals for call loans. There has been no material change up to October 14th in those figures either.

The data on page 2 of this exhibit, of course, are presented there for as late a time as is available.

The discount rates on page 4 have not since changed, to my knowledge.

On page 5, the latest data I have are for the week ended September 23rd, 1939. As I said, that was about the peak of yields of these high grade obligations, but for that week the average on United States Government long term bonds was 2.74 per cent. For the same week, the average on the 15 municipal bonds was 3.29 per cent.

With respect to page 6, the latest figure I have is a figure of 3.86 per cent for the week ended October 14, 1939. The corresponding weekly figure for the week ended September 23rd, 1939, was 4.04 per cent. That was the highest week during the intervening period. That will give you some indication of the extent of the recovery at the peaks of September.

With respect to page 7, for the week ended September 23rd, 1939, the average was 3.26 per cent, and that was the highest weekly average during the month of September and up to the middle of October. For the week ended October 14, 1939, the average was 3.10 per cent.

I have no later information with respect to the corporate bond yields shown on page 8 than what I here present. The yields set opposite the month of October, 1939, on page 8 of the exhibit are based on prices as of about the 20th of September. That is the basis upon which the computations are made up by the Standard Statistics Company. This information on page 8 is based upon a fairly large number of bonds, not just upon eight or ten or seven, but upon a rather extensive list of bonds,
1450 not a continuous list but whatever is available at that time in this classification as so rated by the Standard Statistics Company. Because it is a rather large clerical task, I presume, to prepare such information, they prepare it only on the basis of one point on a month. That is, it is not prepared daily or weekly, but it is prepared once a month on the basis of the price as of about the 20th of the preceding month.

Questions by the Examiner.

I noticed that in his testimony Dr. Dorau stated that the Standard Statistics does not make available its bond list in these different categories, and all I can say in addition thereto is this, that as indicated in the footnote here on page 8, there are a few thousands of bonds involved in this computation. It says: "Based upon all active bonds listed in the Standard Bond Investments." That is a publication that anyone taking the service can get, and so I presume to that extent you could go through that rather voluminous list and have the list of bonds. Of course they indicate at least that they do not include any bonds where the price is affected by call provisions or some other usual circumstance, probably conversion features, and so forth. They attempt to get figures that are representative yields and are not distorted by some particular momentary situation. So to that extent I just mentioned, the list probably could be available, but one from the outside might have trouble in applying their weeding-out process in order to get down to the actual list, but it is supposed to be a rather long list of bonds—several thousand in number as the starting point at least for the study.

(EXHIBIT 180 was offered and received in evidence without objection.)

At this point counsel for complainant produced a document entitled "Summaries of Recent Financing by Natural Gas Systems," with the request that it be marked for identification. At the direction of the Examiner the document was marked Exhibit 181.)

Direct Examination by Mr. Booth Resumed.

I prepared Exhibit 181 for the purposes of this case. This exhibit is a brief summary of financing during the years 1936, 1937, 1938 and 1939 up to about the middle of September, of ten natural gas systems, as I have called them here. The index of these companies is given at the beginning of the exhibit. That is followed by a separate statement or summary for each of the various systems.

At the outset, for each company I have given a brief summary of the character and scope of the operations of the company. That is not intended to be an exhaustive or intensive analysis of these natural gas systems, but is intended merely to show in brief summary form the general character of the system's operations, and where it operates, in order to provide the reader with general orientation, you might say, with respect to the information. That summary, the introductory statement, is followed by a review of financing during the period in chronological order. I don't know whether any further explanation is necessary or not.

In some places through here I have attempted to indicate the cost of money under certain long term debt financing, and I have said in some places, namely, where there were sinking funds involved in the particular security, that the cost of money computation gives effect to sinking fund requirements; that is, if you put out an
1451 issue that is nominally due in 15 years, you can
not figure the cost of money on it by figuring cost to that final maturity if there are intervening—you can call them—maturities—they have the effect of maturities if the intervening period contains a number of retirements due to sinking fund operations. I mean that factor must be taken into account, and I have attempted to do that wherever there are sinking funds involved or connected with a particular issue under discussion.

Questions by the Examiner.

It is just so much arithmetic. This yield basis mathematics that is used in the ordinary bond yield books is simply a matter of finding the present value of all future payments under that contract at the given rate of interest. That is, if we have a 20-year 4 per cent bond with semi-annual coupons, we know that for 20 years, every six months we are going to get $20, and at the end of that 20 years, we get $1,000—speaking now of a $1,000 value bond. If the rate of interest is 5 per cent, that is, if the yield is 5 per cent, you merely find the present value of all of those future payments at a 5 per cent rate of interest. The result is today's prices on such a bond in order to yield to maturity exactly 5 per cent. And the same principle could be applied to any series of future payments.

If I understand you correctly, it would not complicate my estimates here if I had an authorization to the company to reissue bonds under certain conditions under a sinking fund provision; but I don't know that that was involved here. I might say that these sinking fund provisions previously provided that year by year up to maturity a certain number of bonds were to be retired.

Frequently these bonds were retired by calling them at the call price provided for in the indenture for sinking fund redemption. Frequently there is a slight premium, and I have given effect to that in my computations. Of course as a matter of fact, at some future date one of these companies might be able to buy up enough bonds on the open market to satisfy its sinking fund in certain years, and obtain them at a lower price than the call price. If they did that, then the actual cost might work out something different from what I have shown here, but it would be less because of obtaining them at a less price. In other words, I think probably it can be taken as the maximum cost figures.

Cross-Examination Interposed by Mr. Morgan.

Exhibit 181 is my interpretation of the facts as I have gathered them from prospectuses issued in connection with public financing and from annual reports to stockholders or releases of the Securities and Exchange Commission, and in some cases from Poor's or Moody's Manuals. I might have gotten information from the Commercial and Financial Chronicle, and in one or two instances I think I obtained information directly from the underwriters. I have made no independent check of the accuracy of the information. I have my working papers that I used in connection with the exhibit. They will be available to someone representing the companies in the event they want to go over them with me.

(EXHIBIT 181 was offered and received in evidence without objection.)

1452 *Direct Examination by Mr. Booth Resumed.*

You have asked me to assume that an investment is to be amortized or depreciated over a 16-year period; that 8 per cent per annum is to be paid on the investment, and that this 8 per cent includes 5.25 per cent for risk premium. You then ask me, if the annual amortization allowance and the risk premium payments were accumulated together, how many years would be required for these two funds to aggregate 100 per cent of the original investment. These two items, that is, the risk premium and the amortization, would aggregate 100 per cent of the original investment in 8½ to 9 years. More specifically, the accumulation would be something less than 100 per cent in 8½ years and something more than 100 per cent in 9 years, but the precise amount would fall between those two extremes. My answer is based upon straight line amortization. I did not allow for interest on the funds accruing during the 8½ to 9 years.

Since the period considered is 16 years, 1/16, or 6.25 per cent, of the investment would constitute the annual straight line amortization. A risk premium of 5.25 per cent added to this amortization gives a total of 11.50 per cent of the investment as the annual addition to the accumulation. Obviously, if 11.5 per cent accrues each year, then 100 per cent divided by 11.5 per cent gives the number of years required to accrue 100 per cent. The result is 8.7 years, or, as I have already said, between 8½ and 9 years.

If the annual amortization were computed on a sinking fund basis instead of a straight line basis, the answer would depend somewhat on the rate of interest used to fix the amortization annuity and the rate of interest used to compound the aggregate fund. At 6 per cent interest, somewhere between 8 and 9 years would be required for the amortization and risk premium funds to accumulate to 100 per cent of the investment if the interest were compounded annually. If interest were compounded semi-annually, 8½ to 9 years would be required. Whether the interest rate used be 1 per cent, 2 per cent, 4 per cent or 8 per cent, the period would be between 8 and 9 years, that is, in each case upon the basis of annually compounding interest. On the basis of semi-annually compounding interest in the period, between 8½ and 9 years for 1 per cent, 2 per cent, and 4 per cent rates of interest, but it would be 8 to 8½ years on the basis of 8 per cent rate of interest and semi-annual compounding.

In getting these results the first step is to determine the percentage of the investment representing the annual or semi-annual amount of amortization required to accumulate at the chosen rate of interest to 100 per cent of the investment in 16 years. This percentage is readily determined by reference to standard annuity tables. The next step is to add the percentage of risk premium, namely 5.25 per cent on an annual basis or 2.625 per cent on a semi-annual basis, to the percentage found in the first step in order to arrive at the total percentage accruing annually or semi-annually. The final step is to determine in how many years the resulting total percentage of the investment would accumulate to 100 per cent of the investment when set aside each year or each six months at compound interest at the rate being used in the computation. Reference to standard annuity tables gives an approximate answer, but interpolation of values found in such tables is necessary for a precise answer.

1453 At 6 per cent, the amortization annuity would be 3.90 per cent of the investment for a 16-year period, upon the basis of annual compounding. Adding 5.25 per cent risk premium gives a total annual accumulation of 9.15 per cent. Annuity tables reveal that at 6 per cent, an annuity of 10.10 per cent of an investment will accumulate to 100 per cent in eight years, and that 8.70 per cent of an investment will accrue to 100 per cent in nine years. Since my figure of 9.15 per cent that I was talking about falls between 8.70 per cent and 10.10 per cent, the answer that I seek falls somewhere between eight and nine years. If one were to make a straight line interpolation between those two sums, the result is about 8.7 years.

Cross-Examination Interposed by Mr. Morgan.

You ask me whether I am taking a part of the rate of return and adding it to the amortization allowance. My answer is yes and no. What I am taking is the amortization allowance as computed by the various straight line and sinking fund methods that I have reviewed and adding to the percentage, that is 5.25 on the annual basis or 2.625 per cent on the semi-annual basis, and that latter sum—the percentage—is given to me as the portion of the over-all rate of return of 8 per cent representing risk premium, in other words, and carrying along together two series, namely the amortization on the one hand and the risk premium on the other. I put them together for simplification of the arithmetic, that is all. Yes, I am taking 5.25 of the 8 per cent assumed as the rate of return and adding that to the amount allowed there as a reserve for amortization in arriving at a return of 100 per cent of the capital.

You ask me whether or not that cuts the return down to 2.75 per cent automatically. I think what I am doing is merely some arithmetic based upon certain assumptions that were contained in the question given to me at the start, namely, that if we took annual amortization as a sum of money, and if we took 5.25 per cent as another sum, and if we added those two funds together, we would determine how long it would take the two working together to accumulate 100 per cent of the original investment. I did not allow interest on either fund in the first example by straight line amortization. On the next example, where I used the sinking fund method of determining the amount of amortization, the interest on both funds was compounded at the same rate of interest used in obtaining the amortization annuity in the first place. There is no significant difference in the number of years. I just bring in the arithmetic. I am not testifying to the propriety of doing it in that way. I am doing the arithmetic.

Direct Examination by Mr. Booth Resumed.

You ask me to assume the rate of return to be 6 per cent and to assume that the annual risk premium included therein is only 3.25 per cent instead of 5.25 per cent. With 3.25 per cent annual risk premium and with 16 years amortization, you ask me how many years it would require to accumulate 100 per cent of the original investment. For a 16-year period and a 3.25 per cent risk premium it would take 10.53 years to recover 100 per cent of an investment through the accumulation of the amortization and risk premium funds when the amortization allowance is determined on a straight line basis and when no interest is allowed upon either of the funds. If the depreciation or amortization allowance is determined on a sinking fund basis and if both funds are accumulated at the corresponding rate of interest the results would be as follows:

1454 At a rate of interest of 1 per cent, it would require 10 to 11 years to accumulate 100 per cent of the investment.

On the straight line basis of 3.25 for risk premium, the exact period of accumulation is 10.53 years. If a 1 per cent rate of interest be used, the period is somewhere between 10 and 11 years. As the rate of interest is increased, the length of time decreases, but it decreases very slowly, so that for rates of interest of 2 per cent, 4 per cent, 6 per cent, and 8 per cent, the period of time falls between 10 and

11 years. This is all based on annually compounding interest. If the interest be compounded semi-annually, rates of 1 per cent and 2 per cent would require between 10½ and 11 years to accrue the fund, and for interest rates of 4 per cent, 6 per cent, and 8 per cent, a period of between 10 and 10½ years would be required.

Yes, I am familiar with the procedure sometimes used in rate making whereby the rate of return is applied to an undepreciated rate base and the annual depreciation expense is determined on a sinking fund basis. As I understand that method of procedure, when the annual allowance for depreciation expense or amortization is determined on a sinking fund basis, the rate of return is applied to an undepreciated rate base in order to ascertain the amount of the return. That method of determining the annual depreciation expense or amortization allowance consists simply in finding that sum, called an annuity, that would accrue to the full amount to be depreciated or amortized if the annuity were set aside in a fund and compounded at the rate of interest used to determine the required amount of the annuity. If the return was allowed on an undepreciated rate base, but the annual depreciation expense was determined on a straight line basis, as regards any given rate base, the rate of return on the depreciated rate base would increase year by year. Yes, if the rate of return were originally fixed at 6 per cent, the rate of return on the depreciated rate base would rise progressively above 6 per cent in subsequent years.

If the annual depreciation expense were determined on a sinking fund basis and by use of an interest rate of 2 per cent, and if the rates were fixed so as to provide a rate of return of 8 per cent on the undepreciated rate base, the rate of return on the depreciated base would also rise year by year but less rapidly than in the case of the previous example.

If the annual depreciation or amortization allowance were determined by the use of a 6 per cent rate of interest and a rate of return of 6 per cent were allowed on the undepreciated rate base, the rate of return on the depreciated rate base would remain at 6 per cent in subsequent years if the annual accruals at 6 per cent on the amortization reserve were deducted from the amount of return.

Yes, it can be demonstrated as a general principle that when the annual depreciation or amortization expense is determined by use of a rate of interest equal to the rate of return, the rate of return on the depreciated rate base will remain at the same percentage throughout a period when the interest accumulations on the amortization reserve are deducted from the amount of the return. In other words, the procedure whereby the rate of return is related to an undepreciated rate base when the depreciation or amortization expense is fixed on a sinking fund basis, in reality represents a return at a given rate on the depreciated rate base plus the interest accrual required to accumulate the depreciation annuity to 100 per cent of the amount 1455 being depreciated. That is true so long as the interest rate used to determine the depreciation annuity is the same percentage as the rate of return.

Cross-Examination Interposed by Mr. Morgan.

By an undepreciated rate base I mean the total investment without deduction of anything for depreciation. In order to deal with compound interest problems you have to determine on a sum of money. Perhaps the use of the term "rate base" or something like that is unfortunate. I don't care what you call it particularly, but I am going to apply this arithmetic to a sum of money because we have to deal in those terms. You cannot shift around and use several different kinds of figure and not be consistent throughout in your computations.

While I am on the subject, I might also explain that I have talked and probably will talk more about the earnings on the amortization reserve. There again we may have word trouble if you think of a thing in the ordinary accounting sense. In the accounting sense "reserve" is merely a bookkeeping item and could not earn money, but I don't know just how to avoid those things. It may be that the English language is a little bit deficient in order to get around it. I figure depreciation or amortization or whatever you want to call it. I start out with a total amount without deduction, and when I speak of an undepreciated rate base, I mean the same original total that I started with; and when I speak of a depreciated rate base, I am talking about the original sum that I started with less accruals obtained by the method of amortization or depreciation that I applied.

(At this point counsel for complainant produced a document entitled "Computations in Regard to the Sinking

Fund Method of Amortization and Rate of Return on Net Investment," with the request that it be marked for identification. At the direction of the Examiner the document was marked Exhibit 182.)

Direct Examination by Mr. Booth Resumed.

There are three tables in Exhibit 182. The computations in Table I as well as in Tables II and III are based upon a total investment of $1,000,000 and a period of 10 years. In Table I the annual allowance for amortization, as shown in column B, is established on a straight line basis, therefore representing $100,000 a year in order to accumulate a reserve equal to the total investment of $1,000,000 at the end of the 10 years. The accumulation of the reserve by means of the annual allowance of $100,000 is given in columns C and D. The reserve at the first of each year is shown in column C and the reserve at the end of each year is shown in column D. In columns E and F the amount of the total investment less the amount of the reserve is given. Here again the data are shown both as of the first of each year and as of the end of each year. In column G the sum of $80,000 is given for each of the 10 years, and this represents 8 per cent on the total investment of $1,000,000. In column H the rate of return on the net investment; that is, the investment less the reserve, is shown for each of the years. This is obtained by dividing the $80,000 shown for each year in column G by the amount of the investment less the reserve as of the first of each year, as shown in column E. Obviously the rate of return on the net investment is 8 per cent the first year because the reserve was zero as of the first of the first year. As the net investment decreases the rate of return obviously rises because the amount of
1456 the return has been constant throughout the period.

The amounts in column I represent 8 per cent of the investment less reserve, as shown in column E. The amounts in column J merely represent the excess of 8 per cent on the total investment over 8 per cent on the investment less the reserve. These amounts are obtained by subtracting the amounts in column I from the amounts in column G.

In Table II the annual allowance for amortization, as shown in column B, is determined on a 2 per cent sinking fund basis. This annual allowance amounts to $91,327. In other words, that sum set aside at the end of each year with interest at 2 per cent compounded annually would amount to $1,000,000 at the end of 10 years. The annual interest accrual on the amortization reserve required to accumulate the total investment is given in column C. Column D merely represents the total of columns B and C and is therefore the total annual addition to the reserve. The accumulation of the reserve at the first of each year and at the end of each year is set forth in columns E and F. The amount of the investment less the reserve at the beginning and end of each year is given in columns G and H. In column I the sum of $80,000 is shown for each year as representing 8 per cent on the total investment. In column J the amount of the annual interest accruals on the reserve, as shown in column C, are deducted from the amount representing 8 per cent on the total investment, as shown in column I. In column K the rate of return on the net investment, as shown in column G, is computed by dividing column J by column G. In other words, these percentages in column K represent 8 per cent on the total investment less the interest accruals on the amortization reserve divided by the investment less the reserve. Since there is no reserve at the beginning of the first year the rate of return is 8 per cent for that year. As the reserve accumulates, in other words, as the net investment decreases, the rate of return increases progressively to 56.97 per cent of the net investment in the last year.

My column K on page 2 is similar to column H on page 1. It is supposed to represent the same thing applied to different conditions portrayed on two different pages.

In Table III, the annual allowance for amortization has been computed on an 8 per cent sinking fund basis, or in other words, at the same percentage as the rate applied to the total investment, as set forth in column I. Otherwise Table III is prepared in the same method as Table II. As shown in column B the annuity required to accumulate to $1,000,000 in the 10 years at 8 per cent is $69,029. The necessary interest accumulations at 8 per cent are given in column C. When these interest accumulations are deducted from the 8 per cent on the total investment, as shown in column I, the amounts given in column J are obtained. It may then be seen that these net amounts in column J result in a rate of return of 8 per cent in each year on the net investment, as shown in column G. In other words, the 8 per cent on the total investment, as shown in column I, represents 8 per cent on the net investment shown in column G plus 8 per cent interest accruals, as shown in column G, on the amortization reserve, as shown in column E.

1457 *Cross-Examination Interposed by Mr. Morgan.*

You ask me in which of the cases in which I have testified heretofore I presented figures of this character dealing with the subject of amortization. With respect to Exhibit 182 I have never seen anywhere this arithmetic or this analysis. I have never used it before. It is something that I came upon a few weeks ago in connection with an analysis or study of this sinking fund depreciation method in connection with the undepreciated rate base. I just worked it up in my own mind. It took a number of days and nights of scratching to find out what it was all about; and this is the answer that I have come to, and, as I asked myself, what is involved in the theory to make it a usable and workable method of fixing rates? After considerable use of scratch paper and so on, I finally discovered what was involved in this principle.

No, I don't think the whole study is based on the assumption that there should be no earning on anything except rate base less the reserve. I think in the last analysis it goes even behind that. I think you have to start out with this principle, that any rate making principle to be fair in its application should be such as to allow the recoupment through the rates charged of all the capital consumed in the enterprise, and it should also allow for rate of return on the capital not recouped or not paid back by the rate payers.

You ask whether I am treating that part of the capital investment which has been passed to reserve as having been recouped. When you say "passed to reserve," I would say that part that has been returned through rates by the rate payers and allowed as one of the costs of the business.

(EXHIBIT 182 for identification, offered and received in evidence without objection.)

Direct Examination by Mr. Booth Resumed.

During the past few years in connection with my work before the Illinois Commerce Commission and prior thereto, I have given some consideration to what is known as the factors or influences with respect to the money market. I have given some attention to that problem in connection with studies I have made for the purposes of this case. I believe the outstanding factor or influence has been the large volume of idle funds that has accumulated in recent years. These idle funds are reflected in the banking system in two forms, namely, deposits in banks and excess reserves of the banks themselves. I have prepared an exhibit in connection with this problem.

(At this point counsel for complainant requested that the document just referred to by the witness, entitled "Money Market Factors," be marked for identification. At the direction of the Examiner the document was marked Exhibit 183.)

Table I of this exhibit shows the number of banks and the amount of bank deposits in the United States as of December 31, 1923, and as of the same date for all subsequent years up to and including 1938, and also as of June 30, 1939. The first two columns of figures are for all banks. It shows the number of all banks and the amount of their deposits.

The second two columns of figures are for member banks of the Federal Reserve System. The remaining two columns are for non-member banks.

I might explain briefly that when I refer to member banks, I refer to banks that are members of the Fed-
1458 eral Reserve system. All National banks are of course required by law to be members of the System. State banks and private banks and so forth can become members if they can meet certain conditions prescribed by law and by the Board of Governors of the Federal Reserve system. I believe that gives the general scope of the information shown there.

Total bank deposits rose from $42,163 millions at the end of 1923 to a peak of $56,766 millions at the end of 1928. The decline that followed carried the total down to $38,505 millions at the end of 1933. Since 1933 the volume of deposits has risen steadily to reach a total of $55,988 millions as of June 30, 1939.

Bank deposits plus money in circulation constitute the most liquid form of capital. From 1921 to 1929, inclusive, based upon data as of December 31 each year, the amount of money in circulation ranged between $4,403 millions to $4,817 millions. Since 1929 the trend has been generally upward. As of December 31, 1938, the amount of money in circulation was $6,856 millions. On August 31, 1939, the total was $7,171 millions. I do not show in this exhibit the amount of money in circulation.

I would say that this large volume of liquid resources influences the money market in two ways or from two different points of view. Large balances held by institutional and other investors exert pressure on the money market from the standpoint of the supply of money available for investment. In other words, these resources are ready to flow into new securities and investments whenever the opportunity is afforded. Large balances held by commercial and industrial firms is an important factor in reducing demands for capital from outside sources. That is, when commerce and industry have large liquid resources there is less need to rely upon banks and investors for funds with which to expand operations. This situation helps to account for the reduced demand in recent years for commercial loans and new capital financing.

In 1929, total loans by all member banks exceeded 26 billions of dollars. The total declined steadily to a figure of a little less than $12 billions in 1935. Subsequent increases carried the total to $13,141 millions as of June 30, 1939,—about half of the 1929 total.

Table II is nothing more than a breakdown of the amount of deposits shown for member banks in Table I. On Table II the deposits of member banks are broken down into demand deposits and time deposits. The amount of each class of deposits is shown, together with the percentage relationship that each class bears to the total. Technically, you might observe that in recent years the demand deposits have come to occupy a little greater percentage of the total compared with what was true back in the early 30's—of 1930, 1931, and 1932.

A demand deposit is a deposit that is payable on demand. Time deposits are savings deposits which technically at least can be withdrawn only upon certain notice to the bank. Actually, of course, most banks will let you take out time deposits on demand, but they can if they want enforce a 30 or 60-day notice rule or something to that effect.

Another important item to be considered in relation to the volume of bank deposits is the rate of turnover of bank deposits. Table III presents the average annual rate of velocity or turnover of demand deposits in recent

1459 years for New York City and for 100 leading cities outside of New York City. I might explain that by velocity or turnover I am referring to the relation between the amount of checks drawn upon an account to the average amount of the account. That is, if the deposit or the account averages $1,000, we will say, and if checks are drawn in the amount of $12,000 during the year, the turnover would be 12 times. This turnover is expressed in the "Times" in Table III. Ordinarily speaking, whatever the amount of the deposits in the New York City banks were for the year 1939, there were 23.2 times that turnover of those deposits during the year. It is the ratio of, you might say, bank debits, which are charges for checks drawn against individual accounts, to the average balances, namely deposits.

The bank reserves to which I am referring are the deposits that member banks have in the Federal Reserve banks. That is, the member banks keep their extra resources on deposit with the Federal Reserve banks. Part of these reserves are known as "required reserves." Under the Federal Reserve Act, member banks must at all times keep on deposit with the Federal Reserve a certain percentage of the deposits placed with them by their depositors. Any excess on deposit with the Federal Reserve over and above these required reserves is known as excess reserves.

Turning to Table V, that is merely a schedule showing for different periods the percentages of deposits required to be kept on deposit with the Federal Reserve bank by the member banks. On Table V, the heading on the left which reads as follows, "On Net ~~Demand~~ Deposits," there are three headings, namely, "Central Reserve, City," "Reserve City," and "Country." I ought to explain that the percentages shown opposite that "Central Reserve, City" refer to the percentage of deposits required as reserves from banks located in what are known as central reserve cities. Presently those are merely Chicago and New York. The percentages opposite the heading "Reserve City" refer to the percentages of reserves required in the case of banks in the reserve cities. Reserve cities are designated by the Board of Governors of the Federal Reserve system and include some of the other large cities in the country, I think principally the 10 other cities where the other reserve banks are located. All other banks are known as country banks;

that does not mean small town banks necessarily, but that would include banks in some pretty good sized cities.

Finally, of course, the percentage required of time deposits is shown. That is the same for all classes of banks there.

Table IV, which you asked me to discuss, shows the total reserves of member banks on deposit with the Federal Reserve system and that total is broken down into required and excess reserves. You will observe that the excess reserves are rather nominal until 1932. So that since 1932 or beginning in 1932, the total reserves of the member banks have risen quite rapidly and the excessive reserves have also risen quite rapidly.

I have inserted in this table references to changes in the percentages of reserves required in order to help explain some of the rather marked changes up or down in the excess reserves.

Questions by the Examiner.

The excess reserve is placed by the member banks with the central bank. These are pretty much idle funds we are talking about here. The central banks—the Federal Reserve banks—might be called bankers' banks. 1460

They stand in the same relation to the member banks that the member bank stands in with its depositors. The member banks do not keep their funds on hand; they do not keep on hand these billions of dollars of cash. The Federal Reserve is a better depository for that purpose than they are themselves, and if all of the member banks, for example, had 5 billion dollars of total reserves with the Federal Reserve system, part of that 5 billion dollars would be required reserves, that is, under the law these banks are required to keep there a certain percentage of their deposits, just as a safeguard for the depositors, and if the Federal Reserve were to increase their percentage, that would automatically decrease the amount of the excess.

I have put references in here to the changes in the percentage requirements in order to explain some of the larger changes up or down in the excess reserves as shown in the extreme right hand column of Table IV.

Direct Examination by Mr. Booth Resumed.

As I just said, these excess reserves represent the idle funds of the member banks. Banks are presumably in business to make a profit, so the more idle funds they have, the greater the pressure to put those funds to work and earn a return on that; that is, the banks will do whatever they reasonably and legally can to put their money to work and make a profit. Furthermore, I might point out that this amount of excess reserves shown here in Table IV does not tell the whole story until you consider the possibilities of credit expansion connected with the amount of reserves; that is, every dollar of excess reserves represents several dollars of potential loans and investments. That is, a bank may use its excess reserves to make loans to a customer. That results in a deposit to the customer's credit given by the bank, but the bank is required to keep only a percentage of this deposit at the Federal Reserve, but an excess is still available for further loans and investments.

The principle factor accounting for the growth in member bank reserves in recent years has been the increase in our gold stock. Other factors affecting reserves are the operations of the Federal Reserve system, and of the United States Treasury. You ask how the growth in the gold stock has been a factor. I might say before going into that answer, that the monetary gold stock of the United States from 1933 to date is given in Table VI. That gold coming into the banking system here from abroad or from newly mined sources has resulted in deposits in the banking system to the credit of whoever brought in the gold; but since only a percentage of these deposits must be kept as required reserves, the balance has operated to become excess reserves. Reserves are, after all, hard cash with the Federal Reserve banks.

The Federal Reserve system, pursuant to policy set by the Board of Governors, can effect changes in bank deposits and member bank reserves by controlling the discount rate, by open market operations and by changes in reserve requirements.

The discount rate is the rate of interest Federal Reserve banks charge member banks for loans made to them. Since such a loan is a deposit in a Federal Reserve bank to the credit of the member bank, such a loan adds to the bank's

reserves, which are merely deposits with a Federal
1461 Reserve bank. By increasing or decreasing the discount rate, the Federal Reserve can, within limits, discourage or encourage member banks to borrow; in other words, to increase reserves. This control is, of course, limited because member banks would not borrow even at a very low rate if it were not profitable to do so. As a matter of fact, member bank borrowing is presently very nominal in relation to the amount of 1928 and 1929. Specifically, borrowings by all member banks were only $5,000,000 on June 30, 1939, as compared with $1,162 millions on December 31, 1928. In view of the excess funds held by the member banks and the consequent absence of need for borrowing, the discount rate presently is not an important or effective factor in the growth of member bank reserves. Nevertheless, since the member banks now hold nearly $11 billions of U. S. securities, they could borrow on them at present very low interest rates by discounting them or pledging them with the Federal Reserve System, and thus obtain a very large volume of additional money if commerce and industry were to place any such demand for funds upon the banks.

By buying or selling securities in the open market, the Federal Reserve can increase or decrease member bank balances. That is, when the Federal Reserve buys, its funds get into the banks and increase deposits and reserves. When the Federal Reserve sells, it of course takes funds out of the banks, thus decreasing deposits and reserves. The Federal Reserve banks have contributed to easy money conditions by increasing their holdings of Government securities from $511 millions on December 31, 1929, to $2,826 millions as of September 20, 1939.

When reserve requirements are raised, the amount of excess reserves is automatically reduced, thereby reducing the amount of funds available for loans and investments by the member banks. By reducing reserve requirements, the opposite result can be produced, of course. The extent to which reserve requirements can be raised or lowered is limited by provisions in the Federal Reserve Act. Even under maximum requirements now possible, there would still be a huge volume of excess reserves, however. I might point out that the maximum legal requirements are the percentages shown by Table V to have been in effect from May 1, 1937 to April 15, 1938, and these are the maximum percentages of required reserves under the Federal Reserve Act.

That brings us to Table VII. Table VII shows the gross debt of the United States by months from January 1933 to July 1939. The table also shows the investment of member banks and of the Federal Reserve banks in the direct obligations of the United States at various dates over the past few years. The holdings of member banks rose from $6,540 millions at December 31, 1932, to $10,946 millions at June 30, 1939. The holdings of the Federal Reserve banks rose from $1,763 millions at January 31, 1933, to $2,426 millions at August 31, 1939. When the Federal Reserve banks acquire U. S. securities, it results in the ultimate expansion of deposits and reserves of the banks. What it really amounts to is a shift of funds from the Federal Reserve—its own funds—to the banks. Eventually it gets back in the Federal Reserve in the form of deposits by member banks in the Federal Reserve. When the member banks acquire U. S. securities, no immediate expansion in deposits and reserves results unless the member banks borrow in order to buy securities. That is, if they were to borrow from the Federal Reserve in order to buy United States securities, that would create additional deposits in the banking system and additional reserves at the Federal Reserve bank, but when they use their own
1462 funds, of course there is no such increase in deposits and reserves. I mentioned a while ago that member banks have practically no debt owing to the Federal Reserve at this time, so the process whereby a member bank borrows in order to buy United States securities has actually not been operative. It is potential, but it has not been operative as a matter of fact; but these roughly $11,000 million dollars in United States securities held by the member banks represent potential means whereby the banks can obtain funds if they find a need for them.

Speaking of the United States Treasury operations further, the Treasury in recent years has made large purchases of silver, and that adds to the deposits and reserves just the same as the increase in the gold stock. The reason is that the Treasury has issued silver certificates to finance the purchase of the silver. Silver certificates, of course, getting into the banking system as cash add to deposits, and in turn add to the cash reserves of the Federal Reserve System.

There are certain potential means of making still further additions to the volume of excess reserves. If the Treasury were to disburse funds representing gold held in the Stabilization Fund, and if it were to reduce its large balances at the Federal Reserve banks or if it were to issue currency against its holdings of silver bullion, deposits and reserves of the banking system would be increased substantially. Furthermore, the Treasury has authority to issue up to $3,000 millions of United States notes, that is, currency. On the other hand, the volume of reserves could be reduced by the Treasury through sale of securities to increase its balances at the Federal Reserve bank or by acquiring additional cash. The Federal Reserve could also effect some reduction in excess reserves by again raising reserve requirements to the maximum permitted by the law.

Cross-Examination Interposed by Mr. Morgan.

You ask if these affirmative statements that I have been making about Exhibit 183 are contained in the sources and merely abstracted or paraphrased by me or whether they represent my own interpretation of what the figures taken from those authorities show. I would say partly both. I think if you will read the annual reports of the Federal Reserve system, that is the Board of Governors of the Federal Reserve system, for recent years, you will find that most of these things are discussed. That is, the Board of Governors is required by law to set forth in its report to Congress its actions and its reasons therefore; that is, it must state its policies in black and white. There can be no secret about it. You ask if these statements I make as to why this or how that might influence the banking situation are my own interpretations. Yes, I believe them to be true. I do not want to take any credit for being original in this. Other people have said the same thing, and you can find this view expressed probably in a number of places if you make a search for it. I am willing to take the responsibility for any opinions that I might have expressed.

(At this point EXHIBIT 183 was offered and received in evidence without objection.

At this point counsel for complainant produced a document described as a copy of Exhibit 20 introduced before the Illinois Commerce Commission in Docket No. 21170, which counsel stated was another exhibit submitted by Mr.

Ralph W. Gallagher in that proceeding, with the request that it be marked for identification. At the direction of the Examiner the document was marked Exhibit 184.)

1463 *Direct Examination by Mr. Booth Resumed.*

I have examined Exhibit 184 for identification. It shows the basis of computing the estimated amortization charges. Most of the property was amortized, or the amortization requirements were computed, upon the basis of a 15-year period and a rate of interest of 6 per cent. The gasoline plant property at Fritch, Texas, was set up upon a 10-year basis, but still at 6 per cent. It also provided that in the case of gas wells drilled in say the tenth year of the 15-year period, those wells would be amortized over the remaining five, but in general a 15-year period was used and throughout a 6 per cent rate of interest was used. The method of amortization provided for was on a sinking fund basis.

(At the request of counsel for complainant and at the direction of the Examiner, the reporter copied into the record the material embodied on pages 13, 14, 15, and 16 of Exhibit 184, as follows:

Page 13.

Amortization of Cost of Gas Leases and Wells.

A Gas leases were amortized at the rate of 4.3% per year which is on the basis of a 15-year sinking fund with interest compounded annually at 6%. The investment involved is $15,429,768 and the annual expense is $665,000.

B Gas wells were all amortized by the end of the 15-year period. Wells drilled or purchased in the first year were amortized in 15 years on the sinking fund basis. Wells drilled in the 10th year were amortized in 5 years. Thus this charge varies from year to year but averages $472,000.

Page 14

Amortization of Investment in Gathering Lines.

Total investment amortized during the 15-year period of operation. The amount spent the first year was amortized in 15 years, on the sinking fund method compounding the interest annually at 6%. The amount spent in the 5th year was amortized in 10 years, etc. The investment changes from $4,589,000 in the first year to $7,109,000 in the fifteenth.

Page 15

Amortization of Investment in Gasoline Plant.

This plant was amortized in 10 years, assuming a net salvage value at the end of that time of 10%. Thus the amortization rate on this plant was computed at 7.6% per year on 90% of the investment. This gives $51,000 per year.

Page 16

Amortization of Main Line and Compressor Stations.

This was computed on a fifteen year sinking fund basis compounding the interest annually at 6%. This gives an amortization rate of 4.3% per year which is applicable to $49,608,123, resulting in an annual figure of $2,140,000.

Above investment includes pipeline, telephone, compressor stations, interest during construction and overhead.)

1464 CHARLES W. KNAPP, JR., a witness for the Federal Power Commission, testified:

(November 6, 1939)

Direct Examination by Mr. Slaff.

My name is Charles W. Knapp, Jr. I am employed by the Federal Power Commission in the capacity of Principal Examiner of Accounts in the Division of Finance, which is a division of the Bureau of Accounts, Finance and Rates. I have been with the Federal Power Commission since December, 1938.

I attended the University of Vermont and graduated with the Bachelor of Arts degree. I am a certified public accountant of the State of New York, having obtained my certificate in 1934. I was a member of Phi Beta Kappa. I am also a member of the New York State Society of Certified Public Accountants. As to employment previous, going backward in time, prior to my commencement with the Federal Power Commission, during 1938 I was engaged in private practice in and about New York City, having a construction, manufacturing and publishing clientele. During 1937 and 1938, or a very small part of 1938, I was employed by Allen R. Smart & Company, certified public accountants, in their New York office as senior accountant, and was in charge of audits of United Aircraft Corporation and subsidiaries for the year 1937.

Prior to joining Allen R. Smart & Company, I was employed by the Federal Communications Commission as an accounting expert on its investigation of the American Telephone & Telegraph Company, and while with that Commission, I was engaged on an analysis of the principles and methods of consolidation employed in the preparation of the Bell system financial statements, in analysis and reports of the history of holding company investments in the Associated Telephone Companies, in analysis and reports of financial history of the Western Electric Company, as well as other studies and reports. The period of employment with that Commission was during the years 1935 to approximately the early part of the summer of 1937.

Prior to my employment by the Federal Communications Commission, I was employed by Arthur Anderson & Company, accountants and auditors at their New York office as senior accountant, in charge of the audits of the eastern operating subsidiaries of one of the largest, if not the largest, independent systems of telephone utility companies in the country, as well as of holding and subholding company audits and consolidation work of that system.

I was also engaged during my period with Arthur Anderson & Company, which was the period 1932 to 1935, on audits of electric, gas and water utilities.

Prior to my employment by Arthur Anderson & Company, I was for several years employed by public accounting firms, including approximately a year with Peat, Marwick, Mitchell & Company in 1925 and 1926, as well as having held positions as accountant in private industrial and commercial companies.

1465 In connection with this proceeding certain exhibits have been prepared dealing with various factors involved in arriving at a determination of a proper rate of return. These exhibits were prepared at the direction and under the general supervision of Mr. Charles W. Smith, Chief of the Bureau of Accounts, Finance and Rates of the Federal Power Commission. They have been prepared in two parts, which have been designated Part 1 and Part 2. I am going to testify to so-called Part 1, and Mr. Smith is going to testify with respect to so-called Part 2, according to my understanding.

Briefly, Part 1 contains data on general interest rates and yields, general economic conditions, comparative risks of public utilities and other forms of enterprise, and economic conditions in and adjacent to the Chicago industrial area.

Part 2 contains data relating specifically to the natural gas industry and is comprised of general statistics pertaining to the natural gas industry as compiled by the United States Bureau of Mines and the American Gas Association, and information concerning the issuance, ownership, prices, and yields of securities of natural gas companies.

(At this point counsel for the Commission handed the reporter a document entitled "Rate of Return Study, Part I" with the request that it be marked as an exhibit. At the direction of the Examiner the document was marked Exhibit 185.)

In the very first part of Exhibit No. 185 will be found a table of contents from which it will be seen that the data contained in Part I consists of exhibits ranged in several groups or sections. These sections in the order of their appearance, as indicated by the table of contents, are as follows:

1. "General Interest Rates and Yields," which relates generally to yields on investments and commercial paper.

2. "Utility Interest Rates and Yields," pertaining to yields on utility securities and containing information on recent financing by public utilities in general and, in addition, data compiled separately covering new financing by electric utilities during the period from 1935 through August, 1939.

No. 3 is the section "Economic Conditions," which gives a general picture of economic conditions both currently and for the period since 1920 as indicated by indexes of wholesale prices, general business activity and, for the period since 1929, national income payments.

The fourth section is entitled "Comparative Risk" and gives an indication of the relative risks of public utilities as compared with other forms of enterprise.

By reference to the table of contents it will be noted that the various sections which have just been described contain exhibits which consist of charts and schedules. The schedules support the charts, or, in other words, contain the detailed information which is reproduced on the charts for the purpose of facilitating the giving of testi-

mony. For example, where a schedule number ap-
1466 pears on the same line as a chart number in the table of contents, the schedule and chart should be read in conjunction with one another. In certain instances a schedule number appears without a related chart number, in which case the schedule stands by itself.

The first section of this exhibit has three charts and three schedules and deals with general interest rates and yields. As a preliminary to Chart 1 and Schedule 1, pages 1 to 11, inclusive, I might say that Moody's Investors Service publishes a considerable amount of financial data, and its publications are accepted and relied upon generally for purposes such as are now being considered. Chart 1 shows the bond yield averages of 120 domestic corporations according to ratings given by Moody's publications. There are not always 120 corporations in the list, and there are not that number of corporations at this time, principally because of the difficulty of finding industrial bonds of the higher ratings. By reference to page 8 of Schedule 1, it will be observed that the industrial group of Aaa bonds consists of only four issues or issues of four companies. For Aa bonds there are only the bonds of three industrial companies. Page 10 shows that for Moody's rating of A there are only 8 industrial bonds, whereas for Moody's rating of Baa, shown on page 11, the list contains ten bonds. With respect to public utilities, I believe there are 10 bonds in each one of the groups.

Chart 1 shows the range of bond yield averages since 1920. The composite average yield for all bonds included in the data, as will be noted, had reached by the end of 1936 the lowest level recorded since 1920, namely, 3.67 per cent. These percentages, incidentally, may be found in the schedule immediately following the chart. After rising during 1937 and the early part of 1938 to 4.50 per cent in April, 1938, a decline took place which has carried the composite average through August, 1939, down to about the 1936 level. It is down as of August, 1939, to where it was in January, 1937, at about 3.67 per cent. The composite line is the one that has the tag, "120 domestic corporations," which is written out over the years '34, '35, and '36. The dotted line is the 30 domestic corporations rating A.

Now, to continue, since Chart 1 shows the individual rating group averages from which the composite average is derived, it can be seen that the decline since April, 1938, has brought the average yields for bonds of Aaa and Aa rating considerably below the 1936 level, while A bonds, that is bonds of A rating, remained slightly above the 1936 level. The low point in 1936 as compared with the yield shown for August, 1939, is as follows: Aaa bonds, 1936—3.10 per cent, August, 1939—2.93 per cent; Aa bonds, 1936—3.28 per cent; August, 1939—3.11 per cent; A bonds, 1936—3.78 per cent; August, 1939—3.80 per cent.

I don't think the fact that the dotted line becomes a solid line in parts is indicative of anything. I think that is due to the process of reproduction. I believe it is entirely due to the method by which the chart was reproduced.

Now, I was just pointing out that the bonds of Aaa and Aa rating were in August, 1939, considerably below the 1936 level, while bonds of A rating remain slightly above that level. The risk factor associated with bonds of Baa rating is reflected by the marked rise commencing
1467 in the latter part of 1937 and culminating in the
early part of 1938, since which time the yield has declined and in August stood at 4.85 per cent, or almost one-half per cent higher than at the close of 1936, in contrast with the experience of bonds of higher grade.

I think further examination of Chart 1 reveals the virtual collapse of the bond market in 1931 and the continuation of an extreme degree of weakness in that market for the greater part of three years. In this period bonds most severely affected were those regarded as subject to greater investor risk. It is noteworthy that while the yields on Baa and A bonds reached 11.63 per cent and 8.5 per cent, respectively, in this period, the highest yield recorded for Aaa bonds was only 5.41 per cent and for Aa bonds 6.60 per cent.

The data upon which Chart 1 is based appear in Schedule 1 which will be found immediately following the chart. For example, page 1 of Schedule 1 contains the composite monthly and annual average yields for each year commencing with the year 1920 on bonds of 120 domestic corporations including bonds of the four highest Moody bond rating groups. These rating groups are, respectively, Aaa, Aa, A and Baa. Similarly, page 2 contains the average yield on bonds of Aaa rating, page 3 on bonds of Aa rating, page 4 on bonds of A rating, and page 5 on bonds of Baa rating. Each rating group includes, so far as they are available for inclusion, 30 domestic corporation bonds. I pointed out earlier that because of the dearth of industrials in the higher ratings, the Aa and Aaa groups could not contain 30 bonds.

A footnote on page 5 indicates the source from which the data were taken. The lines on the chart can be readily associated with the data contained in these pages of the schedule. For example, page 1 of the schedule shows that the composite yield on bonds of 120 domestic corporations was 4.50 per cent in April, 1938, and this is easily seen by reference to the chart to be the case.

Page 6 describes the mathematical basis of the yield computations. Monthly yield averages are unweighted arithmetic averages of daily yields computed on the basis of closing prices and calculated to maturity dates. No, the statement I have on page 6 under the heading, "Compilation of Moody's Bond Yield Averages," is not a statement of my own. It is a statement which has been published by Moody, and by reference to page 7, a footnote indicates that the source of the definition of Moody's ratings was the "Moody's Public Utilities Manual for 1938" page VIII. I show also the Moody ratings in the "Key to Moody's Bond Ratings" on pages 6 and 7.

Referring to pages 6 and 7, you will note that bonds of Aaa rating are defined as representing the highest type of bond investment. Principal and interest on such bonds are protected by characteristically wide margins, the fluctuation in which is not at all likely to jeopardize the security. Among all rating groups, these bonds hold the best prospect of unchanging quality. Bonds of Aa rating lack one characteristic or another of the highest type of bond investment, while bonds carrying the A rating are more vulnerable to fluctuation in the borrower's position than in the case of the first two classes. It is indicated that some speculative elements exist in bonds of Baa rating, and that the extent and stability of income and security may be satisfactory but certainly not noteworthy.

1468 Pages 8 to 11, inclusive, contain lists of the bonds currently used in Moody's bond yield averages according to rating groups. Aaa bonds, grouped according to classification as "Industrials," "Railroads" and "Public Utilities" are listed on page 8, Aa bonds are similarly listed on page 9, A bonds on page 10, and Baa bonds on page 11. It will be noted that, as we mentioned before, the lists of industrial Aaa, Aa, and B bonds contain fewer than ten bonds, but this is because there were not a sufficiently large number of bonds available to include in these groups.

In introducing Chart 2, I would like to relate it, also, to Chart 3 and state that the purpose of these two charts is to show that the trend of bond yields is not an isolated phenomenon but is part of the broad movement of interest rates in general, as indicated by the somewhat similar patterns observed in interest rates on 4-6 months commercial paper and 60-90 day time loans, as well as in yields on U. S. Treasury bonds. I mean the pattern of the curves shown on Chart 2 and Chart 3 seems to follow the same direction since 1932. Of course, they are on different levels. I think that in a general way it could be said that the curves follow the same general pattern since 1932 as the composite line on Chart 1. The period 1935 through 1939 reflects relatively little change in the rates for either 4-6 months commercial paper or 60-90 day time loans.

In other words, Chart 2 and Chart 3 are merely to portray historically the movement of interest rates, as such, and are not an attempt to offer short term money rates or yields on Treasury bonds as a measure of a proper rate of return.

Chart 2 shows the interest rates charged by banks and is based on averages computed by Standard Statistics Company from data appearing in the Commercial and Financial Chronicle for 4-6 months commercial paper and 60-90 day time loans. The 4-6 months commercial paper is issued by such seasonal borrowers as Armour's and Swift's and is sold to banks through dealers. The 60-90 day time loans on the other hand represent loans to New York Stock Exchange brokers and are secured by mixed collateral, substitutions of collateral being permitted from time to time. Two factors which may be assumed to effect a higher rate for 60-90 day loans than for 4-6 months paper, despite the apparent inconsistency due to the time limits, are that the rate for 60-90 day loans is understood to be more or less fixed by agreements between banks and that a service charge element is presumed to exist by reason of the allowance of substitutions of collateral.

Questions by the Examiner.

The 60-90 day loans bear a rate of interest more or less fixed by agreement, which accounts for the course of the line, which was extremely irregular for a time and then flattened out into a series of plateaus in the lower part of the curve. I can not answer definitely your question as to whether that rate was fixed by agreement before 1934. I can only say that I learned that at present that is the understanding. I can not say whether the Federal Reserve has instituted any method of control that would determine that. Incidentally, my information concerning the explanation of these two lines was obtained through the Federal Reserve Board.

1469 The current rate of 1¼ per cent on 60-90 day time loans is indicated as being lower than at any time since 1920 except for the period extending from 1932 to 1935, while the rate on 4-6 months commercial paper is again at the lowest level since 1920 at ¾ of 1 per cent, after having risen to 1 per cent early in 1937.

Direct Examination by Mr. Slaff Resumed.

Following that chart is Schedule No. 2, pages 1 and 2, which show in figures what the chart portrays graphically. There are also certain footnotes on both pages of Schedule 2 which give the exact source of the data.

Chart 3 shows the yield on U. S. Treasury bonds due or callable after twelve years, as computed by the U. S. Treasury Department for the period since 1920. This chart shows a somewhat similar trend to that shown in Charts 1 and 2, that is, a low point for the period 1920-1936 being reached at the end of 1936 in this case with a yield of about 2¼ per cent. Increasing in 1937 to 2.80 per cent, the yield on U. S. Treasury declined gradually through 1938 and more rapidly in 1939 to 2.16 per cent for July, 1939.

Undoubtedly the low yields associated with Treasury bonds as compared with corporation bonds of Aaa rating, that would be 2.16 per cent against 2.93 per cent, may be attributed to the low risk associated with these securities and to certain tax-exempt features of Treasury bonds.

From the data presented in this section it is seen that money rates are now lower than at any time since 1920 and probably lower than at any time in the histor the country.

A one-page schedule following that chart shows the figures which are portrayed graphically on the chart and the source of the data.

Chart 4 shows Moody's bond yield averages commencing with the year 1934, based on the bonds of 40 public utilities according to Moody's bond ratings. In contrast with Chart 1, which, for bonds of 120 domestic corporations shows declines in yield below the 1936 level only for bonds of the two highest rating groups, that is Aaa and Aa, Chart 4 shows declines below that level through August, 1939, for public utility bonds of all four rating groups. The August, 1939, averages for the various groups are as follows: Aaa—2.83 per cent, Aa—2.97 per cent, A—3.41 per cent, Baa—4.39 per cent.

This chart, I think I have previously stated, deals exclusively with public utility bonds. The names of the companies whose bonds are included in each one of the classifications are shown on page 3 of Schedule 4.

Chart 5 shows Moody's bond yield averages for the period since 1920, based again on bonds of 120 domestic corporations classified as railroads, public utilities, and industrials. They are classified functionally, using the term broadly, rather than according to rating groups. That is the essential distinction between Chart 5 and Chart 1. Chart 5 segregates the bonds according to the type of business of the company as distinguished from the type or quality of rating. If there were a composite line shown on Chart 5, it would be identical with the composite line shown on Chart 1.

1470 The general trends reflected in Chart 5 are similar to those described in connection with the previous charts. In Chart 5, starting from the low point for all groups reached in 1936, the average yields increased until the summer of 1938. The rise in yield for railroad bonds in this period was much more abrupt than in the case of public utilities and industrials and carried the yield on railroad bonds to 5¾ per cent, while public utility yields increased only to 4.11 per cent and industrials to 3.55 per cent. From those points the trend toward lower yields has continued with minor interruptions for all groups, but only in the case of public utilities and industrials have the yields established new lows, the August, 1939, figures being 3.40 per cent for public utilities, and 3.68 per cent for 1936, and 3.21 per cent for industrials, and 3.36 per cent for 1936.

Questions by the Examiner.

The only explanation for the course of the public utility bond yield that I could give would be the investor's attitude. The yields on these securities are based on market prices, as I have stated, and those prices in turn reflect the favor or lack of it on the part of investors.

Direct Examination by Mr. Slaff Resumed.

Railroad yields in August averaged 4.41 per cent, which was still considerably higher than the 3.95 per cent yield recorded for January, 1937, reflecting, as I have just stated, the greater degree of risk attaching to railroad securities from the viewpoint of investors.

The chart indicates that the experience of the industrial group has been somewhat more favorable than that of the public utilities, especially in recent years, but this may be due in part to the limited number of industrial bond issues available for inclusion in the four highest Moody bond rating groups.

This chart is supported by Schedule 5, pages 1 to 3, which shows in figures the data portrayed graphically on the chart and which contains the source of the data, and pages 4 through 6, which contain the names of the companies used currently by Moody's compilations, which are shifting lists.

Chart No. 6 shows the average price of new capital as indicated by Moody's weighted averages of yields on newly issued domestic bonds of industrial corporations, railroads, and public utilities. By the "price of capital" is meant the average yield to maturity on newly issued bonds, such yields being weighted by the amounts of all new issues floated in any given classification or period. The classification "utility bonds," which includes bonds of light, power, and gas utilities, consists wholly of operating companies. The yields indicated in Chart 6 are not, of course, representative of bonds of the same companies or of the same issues at any one date or during any given period. This chart shows a generally downward trend in the price of new capital for all classes of companies commencing about 1932 and continuing until about

1936, from which date the decline has been less pronounced in general. The yields are on the basis of the offering price.

1471 In 1938 the yield on newly issued utility bonds had fallen to 3.49 per cent, which represented the lowest point for any year throughout the entire period since 1921. We have superimposed on that compilation a line showing Federal Power Commission compilations supported by data shown in Schedule 7. These compilations show an average yield on newly issued bonds of electric utilities beginning with the year 1935. I think the lower caption with the arrow points to the lowest line on the chart and states that it is a Federal Power Commission compilation of electric operating companies. That line seems to cross the curve for utility bonds, light, power and gas, in the year 1937 and seems to be somewhat below it again in 1938. As a matter of fact, the 1938 figure for the utility bonds, including light, power and gas, is 3.49 per cent, while the electric utility bonds for the year 1938 average 3.43 per cent or slightly lower than the figure for the utility bonds in general.

That chart indicates that since 1921 the average price of new capital for industrial concerns has been consistently higher than that for public utilities. It is also indicated in that connection that from 1921 through 1932 the market for new railroad bonds was more favorable than for public utility bonds. In 1933, however, this position was reversed and public utility bonds were marketed from 1933 through 1936 on more favorable terms than either railroad or industrial bonds. While the yield on newly issued railroad bonds was slightly more favorable in 1937 and 1938 than on public utility bonds in general, the lowest yield in 1938, as I have just stated, was for bonds of electric operating utility companies for which the average yield in 1938 was 3.43 per cent.

The data supporting the line on Chart 6, representing the average price of new capital for electric operating utilities as compiled by the Federal Power Commission are summarized in Schedule 7, where the information is shown by years on page 1 and according to Moody rating groups on pages 2 and 3.

The rapid decline in the price of new capital, particularly noticeable since 1934, suggested that the decline could be attributed not only to the course of the bond market itself but also to the quality of the offerings. This assumption is greatly strengthened by comparison of the average price of new capital for utility bonds with the average yield on utility bonds of the three highest Moody bond rating groups, i. e., Aaa, Aa and A, so the line superimposed on Chart 6, showing the average annual yield from 1934 to 1938 on 30 utility bonds carrying these Moody ratings, very closely conforms to that showing the price of new capital for utility bonds, and indicates that a very large proportion of the utility bonds offered during that period consisted of bonds of high rating.

That is the explanation for that superimposed line and also explains why we omitted the Baa. We wanted to find out whether, if we took the higher or the highest rating groups, we would find that the resulting curve would conform to the curve for the average price of new capital of utility bonds in general.

Questions by the Examiner.

A graph of Baa public utility bonds, together with that for Aaa, Aa and A, is contained in the preceding Chart 4. Chart 4 gives the information for public utilities, referring to yields on outstanding bonds and not as to new capital.

1472 *Direct Examination by Mr. Slaff Resumed.*

Schedule 8 contains a description of all known electric utility bond issues sold during the first eight months of 1939 and this schedule, consisting of three pages, shows that the market for such bonds, that is, electric utility bonds, continues to be exceptionally favorable, the weighted average yield on all newly issued electric utility bonds during this period, as shown opposite the words "Grand Total" on page 3, being 3.36 per cent or slightly lower than the corresponding average for the year 1938. In this connection it will be noticed, however, that the only new bond issue offered to the public during this period having a Aaa rating was that of Consolidated Gas, Electric Light and Power Company of Baltimore, $7,000,000 principal amount, which sold at a price to yield 2.75 per cent to purchasers.

You state that it appears to you that on this Schedule 8 we had three bonds with Aa rating, ten with A rating, eight with Baa rating, and three with Ba rating, while there were eleven which had no ratings assigned. That is correct with the exception of the A rating group, in which I can count only eight. The Baa bonds that were issued totaled $107,000,000, which was very roughly 20 per cent of the total, and the A bonds totaled $260,000,000, which according to the same very rough calculation is about 40 per cent of the total. The financing done this year and listed in Schedule 8 was represented to the extent of approximately 60 per cent of the total by issues having ratings of A or Baa. The source of the information for Schedule 8 was the various financial publications such as, primarily, the "Commercial and Financial Chronicle," with some reference to the supplements to "Moody's Manual" and "Investments in Public Utilities."

Schedule 9 presents a compilation of all known preferred stock issues of electric utility operating companies sold in the period 1935-1938, showing the cost of money to issuing companies and the yields to purchasers. Comparison with Schedule 7 indicates the relative importance of preferred stock as compared with bonds as a financing medium for electric utilities during this period, bonds and preferred stock being issued in proportions of about 22 to 1, based on dollar volume during the four-year period. Yes, I mean 22 times bonds as per preferred stock issued in dollar amount.

However, at this point I would like to refer to "Statistics of Electric Utilities in the United States" for the year ending December 31, 1937, Classes A and B, page 3, published by the Federal Power Commission. In that publication it is shown at page 3 that preferred stock comprised at December 31, 1937, 15.9% of all outstanding securities, whereas long term debt comprised 51.2%, which indicates that the actual securities outstanding of the various electric utility companies are not in the proportions that are shown by these two schedules. They are both correct for the thing which they indicate.

The statistics published by the Federal Power Commission show the composite balance sheet of the electric utility industry for Class A and B companies, and from that I have derived these percentages of preferred stock and long term debt as percentages of total outstanding securities, whereas in Schedule 9 and in Schedule 7 the facts por-

trayed there merely are issues of securities during
1473 the period 1935 through 1938, which has no specific relation. The distinction is that the Federal Power Commission statistics show outstanding securities, and Schedules 9 and 7 show issues during the period.

In addition to what I have said I would like to call attention to the yields shown by Schedule 9. The average yield to purchasers on preferred stock issues sold in 1935 was 4.38 per cent. There was one issue in that year. For 1936 the yield was 4.62 per cent; for 1937 it was 4.63 per cent; and for 1938 it was 4.85 per cent. The over-all yield during that period on issues of preferred stock was 4.62 per cent. In addition to the yield to the public I show also the cost to the company, which is 4.77 per cent. There appears to be a progressive increase during those four years of the yields on preferred stock. The yields for 1936 and 1937 were almost identical, and the fact is that these yields varied from an average of 4.38 per cent in 1935 to 4.85 per cent in 1938. However, it must be borne in mind that we have here no segregation of yields according to any known rating groups for preferred stocks.

Schedule 10 shows a compilation of new preferred stock issues sold during the first eight months of 1939. In this period the average yield to purchasers was 4.63 per cent, but the yields for individual issues ranged from 4 per cent to 6.90 per cent in quite a variation. In this connection, it will be seen that the 4 per cent yield was for a limited number of shares of an issue of 4½ per cent Series B Preferred Stock of Consolidated Gas Electric Light and Power Company of Baltimore. However, a rather large issue of West Penn Power Company, 297,000 shares of 4½ per cent preferred stock was sold to yield 4.09 per cent to investors and, incidentally, this 4.09 per cent yield was the lowest yield, if we except the 4 per cent yield shown for the small number of shares, recorded for any new preferred stock issued during the entire period since 1935.

A comparison of the average cost of new capital for bonds and preferred stock indicates, as you would expect, that the investors are willing to accept a lower yield on bonds because of the greater security of principal and dependability of income.

(November 7, 1939)

Just prior to the conclusion of my testimony last night

I referred to certain statistics of electric utilities in the United States published by the Federal Power Commission for the year ending December 31, 1937. Those statistics were published in two volumes, and the volume to which I was referring was Volume I. Volume I of those statistics contains data on balance sheets, income statements, and outstanding securities of Class A and Class B electric utilities, while Volume II contains data on operating revenues, operating expenses, electric fixed capital, and physical quantities for the same classes of companies.

We now come to the third group in Exhibit 185 headed "Economic Conditions." Chart 7 shows the range of the composite wholesale commodity price index of the United States Bureau of Labor Statistics over the period since 1920, as well as the indexes for raw materials and finished products. This chart clearly portrays the severe decline in prices which started in 1929 and reached a record low point for the period in 1933. It will also be seen that from March, 1933, to March, 1937, prices rose with minor interruptions, the composite index rising from 60 per cent to 88 per cent of the 1926 level during this period. Since 1937 there has been a gradual but steady decline in whole-
1474 sale prices, with June, 1939, indexes at the lowest levels since 1937.

The all-commodities index covers 813 commodities. The source of that index is indicated at page 3 of Schedule 11. The indexes were computed by the United States Bureau of Labor Statistics and are contained in their publications. As I understand it, the index is weighted according to the importance of the various commodities in the national economy.

The index for June, 1937, for all commodities was 87.2 per cent of the 1926 average. For July, 1937, it was 87.9 per cent. Since July, 1937, there has been a steady decline practically month by month in that index down to the last date shown on the chart, which is June of 1939, at which time the index stood at 75.6, as compared with 87.2 for June, 1937. It has been, on the whole, a downward trend. I find here that in 1930 the average for the year was 86.4; in 1931 the average for the year was 73, and in 1938 the average was 78.6; so that compared with 1930 there has been a decline of approximately 8 points, and as compared with 1931 a rise of approximately 5.5 points. Looking at the first six months of the year 1939, a very rapid mental calculation here indicates that the average for the first half of the year is about 76.5. As to what has happened since June, all I can answer is that for July it shows a further decline to 75.4, which is the last figure I had the opportunity to examine.

I would like to read a few excerpts from the Department of Commerce publication, "Survey of Current Business," which, I think, will relate the indexes here to show their place in economic conditions. The statement comes from the February, 1939, issue of that publication. The quotation is as follows:

"Among the principal price-depressing influences in 1938 were the decline in industrial activity and in consumer income; the heavy supplies of many important farm products, resulting from the record 1937 crops and the above-average harvest of 1938; and the large stocks of many other staple commodities. The expansion in business activity during the second half of 1938, while checking the decline in prices, did not result in any general rise. The need for further inventory readjustments in certain lines, the large volume of idle resources, and the unsettled world political situation tended to prevent any great amount of forward buying, which frequently has been an important price stimulus in the initial stages of expansion in industrial activity. * * *

"As is usual in a period of marked changes in business activity, prices of raw and semifinished materials declined more rapidly than prices of finished products in the 1937-1938 recession and responded more quickly to the rise in industrial activity that began in the midyear (1938) * * *.

"The fall in prices of industrial raw and semifinished materials, which was halted in June (1938), reflected chiefly the reduced purchases resulting from declining business and the accumulation of stocks in producers' hands. Sharp advances from late June to July (1938) in prices of staple commodities (notably rubber, nonferrous metals, scrap steel, hides and silk) were reflected in a moderate advance in the index of prices and industrial raw and semifinished materials, as well as the sharp rise in the spot commodity index. There was no sustained general rise in prices of
these materials, despite the rapid advance in indus-
1475 trial activity subsequent to June (1938), as large
stocks were available to meet increased demands."

These comments serve to indicate that wholesale commodity prices are sensitive to and reflect changes in business trends, industrial activity, and the national economy in general.

Schedule 11, pages 1, 2 and 3, shows the supporting data in back of the graph lines on Chart 7.

Chart 8 shows the Federal Reserve Board's index of industrial production and the Department of Labor's indexes of factory employment and payrolls for the period since 1920, all without adjustment for seasonal variation. The Federal Reserve Board also publishes a seasonally adjusted index of industrial production, as well as an adjusted index of factory employment derived from the unadjusted indexes computed by the U. S. Department of Labor. For the purposes of this study it was considered preferable to use unadjusted indexes for all three series for the sake of uniformity. Comparison of the adjusted and unadjusted indexes for industrial production discloses slight variations, but the general pattern of the indexes over a period of time is quite similar. The seasonally adjusted figure, for example, shows the peak in industrial production following 1933 occurring in December, 1936, at 121 per cent of the 1923-25 average, whereas the unadjusted index shows the peak occurring in March, April and May, 1937, when that index stood at 122 per cent of the 1923-25 average.

In other words, the adjusted indexes generally follow the pattern of the indexes used here. That merely would appear to precede, by a month or two, the pattern of the unadjusted index.

The index of industrial production serves as a measure of changes in the physical volume of the country's industrial output and is made up of two components, manufactures and minerals, covering industries which, in the base period 1923-25, represented directly and indirectly about 80 per cent of the total industrial production, according to Census data. The base period 1923-25 means that the average for that period was taken as 100 per cent.

The chart indicates that industrial production, after reaching in March, 1937, its highest level since 1933, was maintained through May, declined moderately in June, and commencing in September fell abruptly through the remainder of 1937 and more gradually thereafter until May, 1938. From 77 in May the index advanced to 104 in November, 1938, and fell to 94 in May, 1939. The month of June, 1939, witnessed a reversal of the downward trend, the index for that month advancing to 98.

The chart also shows that the general pattern of the trend in industrial production has been reflected also in the indexes of employment and payrolls. It may be observed that early in 1937 the paths of the employment and payrolls indexes met for the first time since 1929, but that since 1937 the gap between them has broadened, indicating that total wage payments are lower now than in 1937, which was the best year that business has experienced since 1929.

1476 *Cross-Examination Interposed by Mr. Morgan.*

I would not be prepared to make any statement concerning wage scales. I have made no study of comparative wage scales between the last year or two and the present time, and 1930 and 1931, for instance. I have some data which I propose to introduce which throws some light on that, but it is not a very extensive study.

Direct Examination by Mr. Slaff Resumed.

Pages 1, 2 and 3 of Schedule 12 are supporting data in the back of Chart 8.

Chart 9 represents another attempt to depict economic conditions and shows carloadings, steel ingot production and building contracts awarded indexes based on a computed normal equal to 100. This chart also shows the decline commencing in 1929 followed by recovery commencing in 1933 and leading up to 1937, in the latter part of which year another decline is recorded. Starting in the early months of 1938, a considerable rise in all indexes occurred but was reversed late in 1938, this time the decline continuing almost to midyear of 1939. All three indexes currently, that is, as of July, 1939, reveal an upward trend but have not yet reached the levels established in the latter part of 1938.

The chart is supported by Schedule 13, pages 1 to 3.

Cross-Examination Interposed by Mr. Morgan.

I have not had the opportunity to carry these figures forward any further than as shown, except perhaps another month; and the change would not be conclusive because the figures that I have are preliminary figures, that is, they are published as preliminary figures. I would be glad to furnish that information.

Direct Examination by Mr. Slaff Resumed.

Chart 10 shows the total amount of national income payments by type of payment for the years 1929 to 1939, inclusive, as computed by the U. S. Department of Commerce. A description of these data in some detail is contained in an article which appeared in the October, 1938 issue of the Survey of Current Business. Briefly, however, the series is intended as an index of the current flow of income to individuals. For this reason the series is not identical with the annual estimates of national income published by the Department of Commerce. The principal differences are that in arriving at estimates of national income payments, all business savings and employer and employee contributions to Social Security, contributions to Federal retirement, and employee contributions to railroad retirement funds are deducted from national income; and all direct relief payments, veterans' compensation, benefit payments under the Social Security Act, and annuities and refunds to Federal employees are added.

The chart shows, as might be expected, that the bulk of national income payments represents compensation of employees. The other major classes of income payments consist of entrepreneural income and dividends and interest.

In 1929 national income payments are estimated to have been in excess of 78½ billions of dollars. The chart starts with that 78½ billion dollars in 1929. By 1933, the figure had declined to less than 46 billion dollars, or only 58 per cent of the 1929 total. In 1934 national income payments increased to 52 billions, in 1935 to 56 billions, in 1936 to over 64 billions, and in 1937 to about 69 billions, 1937 being the peak year following the decline which
1477 carried through to 1933. From 1937 forward the
chart shows for each month a 12-months ending total in order to disclose the trend. Up to that point the chart shows only the yearly total. That was one point on each line, the point in each case being on the line immediately above the year listed at the bottom of the chart. From this point on, that is from 1937 on, the chart discloses the 12-months period for the 12 months ending each month of the year.

The purpose of showing the 12-months ending figure is to carry the trend forward so you can see which direction it is heading in. It is comparable to the figures that are published by corporations where they give each month the figure showing the 12 months' earnings for the month. It is comparable to a moving total. In other words, if the index figure at the beginning of the year were 100 and at the end of the year 90, but at the middle of the year it had been 80, and if I had just plotted the two points at the beginning and end of the year, I would show a downward trend; whereas if I plotted the three points, one at the beginning, one in the middle, and one at the end of the year, I would show a downward trend for the first half of the year and an upward trend for the last half of the year.

Cross-Examination Interposed by Mr. Morgan.

The Department of Labor publishes a series of statistics on average factory weekly earnings. As to whether, in regard to the cost of pipeline construction and operation, the wage scale is more important than the aggregate income of the whole country, that gets down to a question of purpose. Here we are trying to depict general economic conditions. There is a chart contained in this Part I which gives an over-all average of the wage scale, factory wage earners. Let me refer you to Schedule 23, which appears toward the end of Part I. That gives a wage scale, presented in dollars, and with a correlary index.

Direct Examination by Mr. Slaff Resumed.

I had started to tell you that from 1937 on the chart indicates a 12-months average. It is indicated that the trend of national income payments was steadily downward through all of 1938, with the result that total income payments for that year were almost 5 billion dollars less than in 1937. Beginning in 1939, however, this downward trend appears to have been reversed, and each of the first six months of 1939 has witnessed a gradual but consistent increase in total income payments. This movement is in accordance with that previously noted in the discussion of production, employment and payrolls.

Schedule 14 supports Chart 10. I am asked what keeps the dividend and interest payments fairly constant in amount. As a matter of fact, I think if you were to compute the changes in that little section, you would find that while they do not appear graphically to change very much, there is a decided percentage change. That shows on the next page, on Schedule 14 in the column in the middle of the page headed "Dividends and Interest." You see, that column starts out in 1929 at $11,331,000,000, and in 1937 the corresponding figure was down to $9,563,000,000. Comparing 1935 with 1936, which on the chart shows no great relative difference, I see that for 1936 dividends and interest were a billion dollars more than for 1935.

The differences shown on Chart 2 and Chart 3 are 1478 much greater than on Chart 10. When I spoke of dividends and interest on Chart 10, I was referring to dividends on stock and interest on bonds or other types of securities. It represents dollar totals, income received or paid out. The interest on Chart 2 represents interest rates on two specific types of loan, 4—6 months commercial paper, and 60-90 day time loans. Chart 3, of course, represents the yield on Treasury bonds, and those figures in Chart 2 and Chart 3 are merely rates; they are not indicative of volume of income. I would say that if the yields on investments declined, the tendency would be for income from investments to decline.

1479 If the amount of Treasury bonds outstanding, on which Chart 3 is based, does not change materially but the public's desire for those bonds increases, the yield will go down. The dollar amounts of income received by the public, however, will not change. Chart 10 shows the dollar amounts of income.

Questions by the Examiner.

So far as I know, there is no published refinement of the gross income figures shown on Chart 10. Now, in the comments supporting the changes in national income payments, which appear in the Survey of Current Business, it is indicated that the writers had access to information concerning dividends and interest as such separately, but the figures are not published separately, just in a combined form. Of course, no indication is given whatsoever as to the breakdown of the source of this income, whether it is from government bonds or corporation bonds, or stocks. No information of that sort is published.

Direct Examination by Mr. Slaff Resumed.

We now pass to Chart 11. In any discussion of national income, some means of determining the relative value of the dollar, that is, its purchasing power over the necessities of life, is desirable in order to compare changes in real income as distinguished from cash income. For this purpose, the index of the cost of living may be used. Such an index has been computed by the National Industrial Conference Board to show the trend of living costs of wage-earners' families. The index is based on a comprehensive list of retail prices and rents in five classifications which are weighted according to their relative importance as follows: —and these are percentages of the total—Foods, 33; housing, 20; clothing, 12; fuel and light, 5; and sundries, 30. In the latter group are included such items as household furnishings, reading materials, recreation and tobacco, as well as organization dues, medical care, carfare, drugs and toilet articles, and candy.

By obtaining the reciprocal of the cost of living index (base year 1929) the purchasing power of the dollar at 1929 prices may be determined for any date. For example, Schedule 15 indicates that the cost of living index for the year 1933 was 74.9. The reciprocal of this index is 1/74.9, or 0.01335, which, translated into dollars and cents becomes $1.335. This represents an increase of 33.5 per cent since 1929 in the purchasing power of the dollar in its command over the necessities of life for the average wage-earners' family.

Now, I think it may make the statement a little clearer if I were to give you a simple illustration bringing that point out. If you assume that there has been a change in the cost of living index between 1929 and 1933 from 100 down to 80 in 1933, you can proceed along this line to determine what change has occurred in the purchasing power of the dollar. Assume, for example, that four units of a given commodity can be purchased in 1929 for $1, the index for cost of living having declined to 80 in 1933, those same four units in 1933 could be purchased for 80 cents. It is quite clear then that in 1933 five units of that commodity could be purchased for one dollar. In other words,
the number of units which may be purchased in 1933
1480 is 25 per cent more than the number of units which
could be purchased in 1929. Therefore, there has been
an increase of 25 per cent in the value of the dollar, from

a purchasing standpoint, and that indicates that the dollar, at 1929 prices, was worth $1.25 in 1933.

Schedule 15 also shows national income payments at 1929 prices, on the basis of the cost of living index which I have used. Also the chart, of course, indicates by a curve the line showing national income payments at 1929 prices compared with the index of actual cash income during that period.

Schedule 15 also indicates that for every $100 of national income payments received by individuals in the year 1929, only $58.40 was received in 1933. That is seen by reference to column B. But each dollar of this reduced amount of income was worth 1.335 times as much as the 1920 dollar in its command over the necessities of life, so that $58.40 of 1933 cash income was equivalent to $77.90 of 1929 cash income. That last figure of $77.90 of 1929 cash income would be indicated by the figure 77.9 in the third column on Schedule 15 opposite the year 1933.

Therefore, although the index of national income payments declined from 100 in 1929 to 58.4 in 1933, the decline in real income was only from 100 to 77.9. In other words, the effects of the depression would have been much more severe if the cost of living had remained at the 1929 level.

It is of interest to note that the purchasing power of income payments received by individuals in 1937 on the basis indicated, was practically the same as it was in 1929. In 1938 there was a decline both in income received by individuals and in its aggregate purchasing power, while in 1939 the first six months have shown a steady improvement from the standpoint of both cash income and real income.

In my preceding discussion I spoke particularly of 1933 when I was discussing any year after 1929. That was because 1933 was at the low point. I want to emphasize the conditions that existed at the low point, because that gave it the greatest contrast and made it easier to illustrate the problem.

Both my chart and schedule carry the figures and the graph lines down through June 30, 1939. I might add that for the year 1938 and a portion of the year 1939 I have used a 12-months' moving average in order to carry or disclose the trend of those payments during that period of time. That is a 12-months' moving average. Due to the method of reproduction in setting out the years 1938 and 1939, it states those are 2-months' averages ending in the months shown there. That should state that 12 months are shown on there. That completes the section on general economic conditions.

This is followed by a section called in the Table of Contents "Comparative Risk". On Chart 12 the trend of corporate earnings of public utilities is compared with the trend for industrial and railroad corporations. From this chart it may be seen that the trend of utility earnings has not been subject to very sharp deviations as in the case of industrials and railroads. While there was a sharp
1481 decline for the latter two groups, commencing in 1929, and a pronounced rise commencing in 1933, particularly for industrial corporations, no comparable decline from 1929 to 1933 was experienced by public utilities, and utility earnings have shown a more gradual recovery. In all three corporate groups there has been a decline in earnings evidenced since the latter part of 1937, but the decline in public utility earnings has been less pronounced. It will be noted that an upward turn in earnings is evident in the first quarter of 1939 for each of the three groups.

In back of that chart is Schedule No. 16, pages 1 to 6, which show the supporting data and which contain a foot note, or a note showing the source of the statistics. The names of the companies used are not shown in the supporting schedule. I believe it is possible to obtain such a list, if it would be desired. This chart is based on Standard Statistics data, and the data may be found in Volume 3, Current Statistics Section of Standard Trade and Securities, a publication of Standard Statistics Company.

Chart No. 13 shows the relationship of net profit to invested capital based upon studies and publications of the Standard Statistics Company. Two methods of computing invested capital are used. By one of these methods invested capital is considered as representing outstanding securities plus surplus and capital reserves. This method is the basis of the data reflected in Chart 13. Net profit, as defined in the computations used for this chart, represents the amount available for fixed charges after depreciation in order to obtain comparable figures. Reference to Chart 13 indicates again that utilities have greater stability of earnings and a relatively lower investor risk than railroad and industrial corporations.

I have made no calculation which shows the average per cent net profit to total invested capital for each one of those three groups for the entire period 1927 to 1938. You ask me to check your figures bearing on that point, as follows:

The percentages of net capital to total invested capital shown for 400 industrial corporations for each of the years 1927 through 1938, divided by 12, average 6.6 percent; for the years 1930 through 1938, for the same group, 4.6 percent; for the group of 21 leading utility corporations, for the period 1927 through 1938, 5.95 percent, which compares with the 6.6 for the industrials; for the average, for the period 1930 through 1938, for the 21 utility corporations, 5.6, which compares with the 4.6 for the industrials; for railroads, for the period 1927 through 1938, an average of 3.87 percent, and for the period 1930 through 1938, 3.13 percent. I will be glad to check those figures.

I believe I can furnish the names of the 21 leading utility corporations which make up that list, if you will allow me to look at my papers.

Chart 14 is the same as Chart 13 except that Chart 14 is based upon invested capital as representing the property accounts less reserves for depreciation plus inventories. I need add no further comment. I believe the characteristics revealed by both charts are similar and indicate that in the case of the utilities you have a more stable level of earnings, not subject to the very sharp fluctuations that are obtained for the railroad and the industrial corporations.

I would like to refer again to previous testimony on bond yields as indicating that since 1921 public utilities have enjoyed, on the whole, about as favorable a market for
1482 their securities as other forms of enterprise; that since 1933 they have been able to obtain capital at lower costs than other enterprises, and that at least since 1935, in the case of newly issued electric utility bonds, they have been offered on the average at even more favorable terms than those obtained for public utility bonds as a class. Thus, the attitude of investors aids in confirming the favorable position of public utilities from the standpoint of comparative risk.

Questions by the Examiner.

I am referring here specifically to the charts in the section entitled "Utility Interest Rates and Yields". There are a number of these charts. I think it can be quite clearly related.

Direct Examination by Mr. Slaff Resumed.

Chart 15 shows the comparative rediscount rates of the New York and Chicago Federal Reserve banks and indicates that these rates are at the lowest point since 1920. Now the rate of the New York Federal Reserve Bank currently is 1 percent and that of the Chicago Federal Reserve Bank 1½ percent. In examining this chart I have found several points of interest that I would like to mention.

The date of the Federal Reserve Bank of Chicago was the same as that of the New York bank during all or a part of the years 1920 and 1921 and from 1926 to 1933, inclusive, and higher than the rate of the Federal Reserve Bank of New York during the years 1922 to 1925, inclusive, and from 1934 to date except for a few days in August 1937 when both rates stood at 1½ percent. Examination of Chart 15 indicates that when the Chicago rate was higher than the New York rate the variation was generally equal to form 0.5 percent to 1 percent, with an occasional variation of 1.5 percent, as in the latter part of 1922 and early part of 1923. Only twice since 1920 has the New York rate been higher than the Chicago rate, namely, in 1929 and 1932. During 1929 both banks maintained their rates at 5 percent, except from August 9 to November 1, when the New York bank's rate was raised to 6 percent. In 1932, the Chicago bank reduced its rate from 3.5 percent to 2.5 percent on January 25, whereas the New York bank did not reduce its rate to 2.5 percent until June 24. In 1928, when both banks began to increase their rates, it is indicated that the initiative was taken by the Chicago bank, which in three successive moves increased its rates from 3½ percent to 5 percent, corresponding increases being made by the New York bank after intervals of from two to 28 days. No change in rates has been effected by either bank since August, 1937, so far as I am aware.

Schedule 19 supports Chart 15.

Questions by the Examiner.

You ask me what conclusion is to be drawn from those relationships. Ordinarily, you would expect the rates of the New York bank to be lower than those of the Chicago bank, inasmuch as it is the largest money center in the country and the greatest volume of transactions takes place in New York City. As Mr. Ostrander explained yesterday,

the Federal Reserve Banks make use of the rediscount rate in an attempt to control financial conditions, and in periods of boom, for example, as in 1929, you would naturally expect the bank to make it less profitable for the member banks to obtain loans from the regional banks. In an at-
1483 tempt to reduce the amount of credit which might be extended, and which might have the effect of continuing undesirable boom conditions, the bank would make it more costly for the member banks to do business; and, therefore, since they are operating on a profit motive, they would not tend to borrow or increase their borrowings.

Direct Examination by Mr. Slaff Resumed.

Chart 16 compares the prevailing rates charged customers by banks in principal cities of the country and shows separately the rates for banks in New York, banks in eight northern and eastern cities exclusive of New York City, and banks in 27 southern and western cities. As indicated in Schedule 20 supporting the chart,—and that may be found on page 4 of Schedule 20,—the figures relate to rates charged by reporting banks to their own customers as distinguished from open market rates, the averages being based on rates reported for three types of customer loans —commercial loans, and demand and time loans on securities. The cities included in the group of eight other northern and eastern cities and 27 southern and western cities are listed on page 4 of Schedule 20. As indicated by Chart 16, the rates charged customers by New York City banks are considerably lower than those charged by the banks outside New York, while the rates of the eight northern and eastern cities other than New York in turn are lower than the rates charged by the southern and western cities.

It will be noted that all rates have drifted steadily lower since 1933. The levels reached in February, 1939, in which month the Federal Reserve Board discontinued the series, were: New York City—2.24 percent, eight northern and eastern cities, including the City of Chicago—3.33 percent, and 27 southern and eastern cities—4.09 percent.

Schedule 21 contains comparative indexes of department store sales for the United States and the Federal Reserve District of Chicago. It indicates that during the period since 1923 the level of department store sales in this district has compared favorably with that for the nation and in recent years has shown a tendency to remain somewhat higher than that level as compared with the base period 1923-1925.

Schedule 22 contains comparative indexes of factory employment and factory payrolls for the United States, the State of Illinois and the Chicago industrial area. The index for the United States, as computed by the U. S. Bureau of Labor Statistics, is based on an average for the three years 1923-1925 taken as 100, while those for the State of Illinois and Chicago industrial area, as computed by the Illinois Department of Labor, are based on an average for the three years 1925-1927 taken as 100. In order to make the indexes comparable and at the same time more closely related to the year 1929 and subsequent years, a base period 1929-1931 was chosen and the indexes were adjusted so that the monthly average for the three years 1929-1931 is equal to 100.

This schedule indicates that since 1930 employment conditions in the State of Illinois have been somewhat less favorable than for the country as a whole, although in 1937 when the employment index for the United States reached its peak for the period at 114.8, the State of Illinois showed a corresponding high point of 107.1. Since 1937, employment in the State of Illinois has not kept pace with that for the United States, the index for 1938 falling off to a somewhat greater extent and in 1939 recovering in somewhat smaller degree than that for the nation. Employment conditions in the Chicago industrial area, in turn, have
1484 been somewhat less favorable than those for the State
of Illinois, although, also in 1937, employment in the Chicago area reached a peak for the period since 1930, being only 0.6 of 1 percent below the 1929-1931 average. A decline in 1938 is also noticeable in employment in the Chicago area, but that has been followed by some improvement during the 12 months ended August 31, 1939.

With respect to payrolls, the schedule indicates the existence of similar relationships among the three indexes, but generally lower levels for all indexes after 1930 than in the case of employment. However, the improvement in 1939 over 1938 is more marked in the case of the payrolls indexes than for the employment indexes.

Cross-Examination Interposed by Mr. Morgan.

It is questionable whether I could have gotten the same character of comparative material for the States of Iowa, Nebraska, Kansas, Oklahoma, and Texas. I believe that there are only about five or six states which publish that information.

Direct Examination by Mr. Slaff Resumed.

From the fact that the payrolls indexes since 1930 have been generally lower than the employment indexes, it would appear that wage scales had declined to some extent. Further, the greater improvement show in the payrolls indexes than in the employment indexes in 1939 would seem to indicate an upward trend in wage scales. These indications are confirmed by Schedule 23, which shows the factory average weekly earnings for the United States, as computed by the National Industrial Conference Board, and the corresponding figures, as computed for the State of Illinois by the Illinois Department of Labor. Comparable figures for the Chicago industrial area were not available.

From the data referred to, indexes have been adjusted to the base period 1929-1931 in accordance with the method followed for factory employment and payrolls in the preceding schedule.

Now, Schedule 23 shows that the index of weekly earnings after 1930 declined considerably and reached its lowest level for the United States in 1932 at 66.4 percent and for the State of Illinois in 1933 at 68.7 percent of the 1929-1931 average. The indexes show gradual improvement thereafter, however, and for 1937 were above the 1929-1931 average both for the nation and the State of Illinois. In 1938 the indexes fell off to some extent but in 1939 (12 months ended July) the index for the United States rose to slightly above the 1929-1931 average, while for Illinois the index advanced to slightly less than the 1929-1931 average.

It is of interest to note that the dollar amounts of factory average weekly earnings shown in this schedule do not differ greatly as between the United States average and the Illinois average. In 1929, the average for the United States was $28.55, whereas for the State of Illinois it was $28.67. From 1929 to 1934 the Illinois average exceeded the United States average in each year, by amounts ranging from $0.12 in 1929 to $1.61 in 1932, the average difference being approximately $0.80 in favor of the State of Illinois during those years. In 1935, 1936 and 1937, however, average weekly earnings for the United States were in excess of those for the State of Illinois. In 1938, Illinois' average weekly earnings exceeded those for the United States and in 1939 (seven months ended July) the position was reversed, the two figures in 1939 differing, however, by only $0.14.

1485 *Cross-Examination Interposed by Mr. Morgan.*

The average factory weekly earnings for the United States for the years 1930 and 1931, the years when defendants' pipelines were constructed, was $24.23. The average for the years 1938 and 1939 would be approximately $25.30. In 1938 the figure is $24.49; in 1939, $26.12. There would seem to be some slight increase there. For the State of Illinois, the average for 1930 and 1931 is $25.39, whereas for 1938 the figure is $25.07, and for 1939, $25.98, there being less difference in that case.

I am afraid I could not have gotten comparable figures for construction wages. The U. S. Bureau of Labor Statistics publishes a slightly more comprehensive index of factory average weekly earnings, but the disadvantage is that that index only starts in 1932 and it does not get us back far enough in time, and that is why I used this other index. It may be possible that the index computed by the National Industrial Conference Board is broken down, but I am not sure of that point, whether the detailed information is published or not. They undoubtedly have it, but I am not sure whether it is published.

Direct Examination by Mr. Slaff Resumed.

Passing now to Schedule 24, the fact that factory employment and payroll conditions in the Chicago industrial area were indicated as being somewhat less favorable than for the country as a whole led to an inquiry concerning the experience since 1929 of the companies which render utility services in the Chicago area.

For this inquiry, annual operating revenues for the period 1929-1938 of the three companies which render gas, electric and telephone service in Chicago were ascertained and are shown in Schedule 24. The companies are: Gas—The Peoples Gas Light and Coke Company; Electric—

Commonwealth Edison Company; Telephone—Illinois Bell Telephone Company.

The annual operating revenues of these companies have been reduced to indexes taking the 1929-1931 average of total operating revenues as equal to 100, in order to make those indexes again comparable with the preceding schedules.

It is indicated that for all three companies operating revenues declined after 1930, the index in each instance reaching its lowest level in 1933, at which point they were: The Peoples Gas Light and Coke Company—86.4; Commonwealth Edison Company—87.8; and Illinois Bell Telephone Company—79.7.

Revenues for all three companies recovered after 1933 and in 1937 were, in the same order, 104.4, 107.0, and 96.5. In 1938, however in contrast with the experience of industry generally, the indexes for both The Peoples Gas Light and Coke Company and Commonwealth Edison Company reached their highest levels for the entire period 1929-1938, being 106.8 and 112.4, respectively. In contrast,, telephone revenues fell off slightly in 1938.

That completes the detail concerning the charts and schedules of Exhibit 185.

1486 I think it would be helpful to summarize my testimony, and in doing that it may be said that the period since 1929 has been attended by severe economic depression, and that this period has been characterized by declines in interest rates and return on money to about the lowest levels witnessed in this country since 1900.

The improvement in economic conditions during 1937 was followed by a recession in 1938. However, despite the gradual upturn in business which now appears to be in progress, interest rates and yields on investments have continued to decline and in August, 1939, were down to 1936 levels and even lower in some instances.

During the period since 1929, earnings of public utilities have shown a greater degree of stability than those of industrial and railroad corporations, which is an indication that public utilities, in general, are less subject to the risks confronting other forms of business enterprises.

And, finally, while there appears to be some lag in improvement in economic conditions in the Chicago industrial area and adjacent territory as reflected by indexes of factory employment and payrolls, as compared with the country as a whole, nevertheless, other indexes, such as department store sales and average factory weekly earnings, seem to indicate that, in these respects, conditions are on about a par with the rest of the country. And, as has been shown, operating revenues of the gas, electric and telephone utilities serving the City of Chicago have reflected consistent improvement since 1933 to the extent that in 1938, although telephone revenues were slightly below the 1929-1931 average, revenues for the gas and electric utilities serving the City of Chicago were substantially in excess of their 1929-1931 averages.

Questions by the Examiner.

You ask what the social-economic significance of the department store index is. I would simply say department stores, of course, handle a great many varieties of merchandise, and any indexes relating to department store sales would naturally reflect a much wider scope of business activity and manufacturing, and would have greater implications than sales of just one variety of merchandise, such as paint, clothing, or something of that sort.

A department store index has wider applications than that of any single store whose variety of merchandise is very limited. I do not know that you can make that generalization that a department store index is a little more sensitive than the food, clothing and shelter indices. I think each one of those things is sensitive in itself, but by taking department store sales you get a variety. All of these sensitive figures are concentrated into one index largely.

Cross-Examination Interposed by Mr. Booth.

With respect to Schedule No. 24, under the caption "Commonwealth Edison Company" for the year 1938, 1487 the revenues are shown to be $92,926,649. I believe that includes revenues for the Super-Power Company of Illinois, which was taken over by the Edison Company and incorporated as part of its physical property either in that year or the previous year.

I might say here, though, that the figures for the Peoples Gas Light and Coke Company and the Commonwealth Edison Company are figures of the companies alone, without their subsidiaries, to the extent that figures in that direction were available, and if any figure for Super-Power Company is included in Commonwealth Edison it is only because there was no breakdown by which you could determine what the figures for the Super-Power Company were.

Cross-Examination Interposed by Mr. Morgan.

I prepared Exhibit No. 185. In some instances, of course, the actual work was done under my direct supervision. I kept up with it even though I utilized the services of my staff. There weree several employees whose assistance I obtained.

You ask why I started with 1929 instead of 1930. In making up these last several tables, they range from 1929 to 1939, inclusive, ordinarily. Speaking specifically of those last two schedules, 22 and 23, I think an examination of those schedules will indicate that 1929, as we all know, was the most prosperous year, at least from the standpoint of national income, that the country had experienced. Now it seemed to me that in building, and selecting the period to use as a base period, that if I had taken 1930 and 1931, or 1930, 1931 and 1932 as a base, the result would have been to make the indexes currently much more favorable than they actually are if we include 1929.

I meant to say we would be criticized for selecting indexes of this kind, two years of which were not very good years for business—the indexes here indicate that for 1930 and 1931 the index for the United States on factory employment, for example, was 100.2 and 84.7. Now if we had used 1930 and 1931 as an index, we would have arrived, in 1938 and 1939, at indexes much higher than 94 or 101, and I do not think that we should have used those years, because they did not include a sufficient period of time. It would seem to me to be fair that you should use a period which has some prosperity and some depression in it in order to try to get some normal basis upon which to build your indexes. No, we haven't any boom period in these last three years comparable to 1929.

While the pipeline under investigation happened to be built commencing in the middle of 1930, these indexes covered a period of time which is about the lowest length of time you can use in constructing an index. A 10-year period is considered to be about the minimum period which should be covered in an index. I think you have misunderstood me when I said that we would have gotten more favorable results by omitting the 1929 index in our calculations. I did not mean more favorable from the standpoint of one side of this case or another. I mean if we had omitted 1929 from our indexes here, in the base period, that our indexes in 1937 and 1938 would have been much higher in per cent of the base period than they now are. It is just mathematical results.

Direct Examination by Mr. Slaff Resumed.

1488 Taking the Chicago industrial area column on Schedule 22 for 1931, we show an index figure of 82.1. For the 12 months ending August 31, 1939, we show an index figure of 82. If we had taken 1931 as 100, the 12 months ending August 31, 1939 would have been 100. So if we compare the index figures which we show for 1931 and the present time, we get the relative comparison, or the relative relationship that exists. If instead of taking 1931 as 100, I had taken 1931 as 1000, then the 12-months period ending August 31, 1939 would have been 1000. I do show, therefore, the relationship here between individual years, one with another. And the significance of those averages is not hidden. The figures are shown here for each of the years involved. If we took 1913 or 1915, or any year as the base period, and constructed an index from that point upon it, the relationship between given years would appear.

Questions by the Examiner.

If I were to recompute this table on the basis of, say, 1931, or, say, 1930, and just forget 1929, I do not see why it would not be possible to get the same relationship between years from those indices which I have there by scaling all of them up proportionately. The figure for each year would bear the same relation to any other year, no matter what year or period of years you take as a base period. In other words, the proportion of difference in the indexes between years does not change as the result of changing the base period. I have seen the 1929 base used in other instances. However, we find that commodity prices are on, as I recall it, a 1926 base, I think, and labor statistics are usually on a 1923 to 1925 base.

When I use the National Industrial Conference Board figures in this Schedule 23, that is not presented as the

National Industrial Conference Board setup. That has been revised. The National Industrial Conference Board revision date is mentioned in the footnote. I think I have the figure here. That Board's original figures are based on the three-year period 1927-1929. I know it is published, and I just merely have neglected to put it down.

(EXHIBIT 185 was offered and received in evidence without objection.)

Direct Examination by Mr. Slaff Resumed.

I have seen Exhibit 167 in this case, which is Exhibit 49 previously introduced by Mr. James A, Emery in the Chicago District *vs.* Lindheimer case on July 31, 1934. I have made a certain study in connection with that exhibit at Mr. Slaff's request. I attempted to bring that exhibit up to date. (Objection by Company Counsel overruled.) In bringing forward the issues listed in that exhibit, a search was made first in Moody's or Poor's Current Investment Manual, in order to determine whether the issues listed were still outstanding. This was followed by examination of successively earlier editions of the Investment Manuals until complete information was obtained, insofar as possible, with respect to the ultimate disposition of each of the issues shown in that exhibit, that is, whether the issue was permanently retired either through payment, reorganization, and so forth, or whether it was replaced by new issues as the result of refunding operations,
1489 or as the result of consolidations or mergers.

Having proceeded to the point I have just described, information was then obtained concerning new bond debenture and note financing by natural gas production and transmission companies, or by transmission and distribution companies, or by fully integrated companies during the period from January 1, 1933 to August 31, 1939, in order to project the data contained in Exhibit 167 forward into 1939. Care was taken to see that no duplication of issues was permitted to occur, inasmuch as certain issues replacing those contained in Exhibit 167 also, of course, appeared in the compilation of new issues during the period 1933 to 1939.

Exhibit No. 167 indicates that the overall weighted average yield to maturity to purchasers in 1934, on the basis of market prices at June 30, 1934, of the issues listed in Exhibit 167, was 9.7 per cent. This weighted average is indicated as having been computed on the basis of adopting 15 per cent as the maximum yield to maturity on any individual issue.

Using the list of issues contained in Exhibit 167 projected into 1939 by the method previously described, the yield to maturity approximated to the nearest price quotation based on the average of bid and asked prices as of August 31, 1939, was computed for the individual issues. The overall weighted average of these yields was then computed as of August 31, 1939, based on the most recently available data as to principal amounts outstanding.

That over-all weighted average yield to maturity as of August 31, 1939, the closest date thereto, comes to 5.5 per cent as compared with the 9.7 per cent shown in Exhibit 167.

In that connection, I also took the issues of similar companies which were privately sold during the years 1933 to 1939 and added them in. I added those into the weighted average and got a new weighted average figure. Taking those new issues during the period 1933 to 1939 privately sold, and adding the yields to maturity based on offering price to purchasers, and weighting those issues in with the ones previously described, the resulting overall weighted average yield to maturity was determined to be 5.08 per cent.

At Mr. Slaff's request I also made some studies in connection with Exhibit 150, introduced in this case by Mr. Gilman. I determined the weighted average yield to maturity for all mortgage bonds of domestic electric and gas utility companies traded on the New York Curb September 15, 1939, as shown on pages 3 and 4 of Exhibit 150. That weighted average yield came to 4.69 per cent, as compared with the simple average yield of 5.12 per cent shown in Exhibit 150.

I also made a study of the mortgage bonds of domestic electric and gas utilities traded on the New York Stock Exchange on September 15, 1939. I obtained the weighted average yield to maturity of those bonds. On September 15, at September 15 prices, the weighted average yield to maturity of all electric and gas utility mortgage bonds traded in on the New York Stock Exchange was 3.63 per cent.

1490 The principal amount outstanding of the issues traded in on the New York Stock Exchange, as of

September 15, was $1,974,700,000. The comparable figure for the bonds shown on pages 3 and 4 of Mr. Gilman's Exhibit 150, was $1,299,410,000. The Stock Exchange list contains approximately 60 issues:

I then proceeded to weight the weighted average figure of 4.69, arrived at for the Curb bonds, with the weighted average figure of 3.63 which I arrived at for the Stock Exchange bonds, and the over-all weighted figure was 4.05 per cent.

At Mr. Slaff's request, I then eliminated from the Stock Exchange list of those companies having more than one issue outstanding, all issues except the one showing the highest yield. With that elimination the over-all weighted average of bonds traded on the New York Stock Exchange was 3.69 per cent. I then weighted that result with the weighted average of 4.69 for Curb bonds and got an over-all weighted average of 4.16 per cent.

I next made a compilation of preferred stocks of electric and gas companies listed on the New York Stock Exchange and traded in on September 15, 1939, of the same character dealt with on page 5 of Mr. Gilman's exhibit for the preferred stocks listed on the New York Curb Exchange. The weighted average yield for the preferred stocks shown on page 5 of Exhibit 150 came to 5.93 per cent as compared with the simple average of 6.4 per cent shown in Exhibit 150. The weighted average yield for the preferred stocks of electric and gas companies traded in on the New York Stock Exchange on the date last mentioned was 4.77 per cent. The combined weighted average yield for preferred stocks shown on page 5 of Exhibit 150 and those shown on the New York Stock Exchange list was 5.43 per cent. The total market price of the outstanding shares on the issues of preferred stock traded in on the New York Stock Exchange on September 15, 1939 was $510,346,144. The corresponding figure for preferred stocks traded in on the New York Curb Exchange shown on page 5 of Mr. Gilman's exhibit, was $672,213,463.

I have the working papers in connection with my testimony here and these working papers will be made available to counsel for the companies and for the Illinois Commerce Commission. These working papers do not show what the issues were as such; but they can be related to the various exhibits by a key system.

Cross-Examination by Mr. Morgan.

My working papers will be made available to Mr. Gilman in case he wants to check them. I have done no more with reference to this check on Exhibit 167 than I have testified to here. I have made no comparison to show the relationship between the percentage of total securities represented by bonds, preferred stocks and common stocks at the prsent time as compared with 1934.

I am not prepared to say what percentage of the total outstanding securities of natural gas companies at the present time is represented by bonds. I do not know the percentage with reference to the seven companies which the witness Emery testified about in connection with his Exhibit 167.

1491 I do not know whether the yields of preferred stock as compared with bonds, and the yields of common stock as compared with bonds, are in the same ratio as in 1934. I have made no study to determine that.

I have testified in only one other rate case. That is in the matter of Safe Harbor Water Power Corporation, Docket No. IT-5494, which was a hearing before the Federal Power Commission, conducted within the past month. I had never testified in any rate case prior to that time. I have had no articles published.

1492 CHARLES W. SMITH, a witness for the Federal Power Commission, testified:

(November 7, 1939.)

Direct Examination by Mr. Slaff.

My name is Charles W. Smith. I live at Halethorpe, Maryland. I am Chief of the Bureau of Accounts, Finance and Rates of the Federal Power Commission. On July 1, 1936, I became Chief of the Commission's Bureau of Finance and Accounts, and on February 2, 1938, the Division of Rates and Statistics was transferred to my jurisdiction and the name of the Bureau changed to that just indicated.

I have a B. S. degree in Finance and Business Administration and an LL.B. degree. I am a Certified Public Accountant of North Carolina and of Maryland, both by examination, the first being obtained about 17 years ago.

I am a past president of the Maryland Association of Certified Public Accountants, a member of the American Institute of Accountants, the American Accounting Association and the American Economic Association. I am also a member of the Maryland Bar. In addition, I am a member of the Committee on Public Utility Statistics and Accounts and the Special Committee on Depreciation of the National Association of Railroad and Utilities Commissioners. The latter association is composed of members of railroad public utility regulatory agencies.

As to experience, after working a few years in various capacities such as copy-boy for a newspaper, clerk and bookkeeper, I became, in 1920, an auditor in the Income Tax Unit of the U. S. Treasury Department, leaving that organization in 1929. About one-half of this time I was an office auditor specializing in consolidated returns, that is, joint returns of two or more companies, usually large companies, including public utilities. The remaining part of the time I was with the Income Tax Unit I was a field auditor and, in this capacity, I examined the books of practically every kind of business institution in Maryland, again including public utilities.

In 1929, as the result of obtaining the highest mark in a competitive examination, I was appointed Chief Auditor of the Public Service Commission of Maryland, which position I held until I accepted my present position. As Chief Auditor of the Public Service Commission of Maryland, I had all the experiences devolving upon the chief financial officer of an active regulatory commission. In that capacity I prepared many financial, accounting, economic, and rate studies and testified relative thereto before the Commission and occasionally before courts. My work with the Federal Power Commission is similar to that while with the Maryland Commission, except, of course, it is now on a national instead of a local scale.

I taught accounting in evening schools for about 10 years. During this time, I covered most accounting subjects. For eight years I taught accounting systems, and for two concurrent years, cost accounting at Johns Hopkins University. I have delivered a good many lectures and have written, somewhat, on financial accounting and economic subjects.

I have testified before relative to the rate of return of a public utility company.

1493 While I was with the Maryland Public Service

Commission, all matters appertaining to fair rate of return were under my supervision and I testified before the Commission in all cases in which rate of return was involved, and, in addition, I testified before the three judge court which heard the case of *C. & P. Telephone Company of Maryland v. West, et al.,* constituting the Public Service Commission.

Since I joined the staff of the Federal Power Commission, I have had supervision of matters appertaining to rate of return and have testified in two cases before the Commission. I have supervised the preparation of exhibits in all cases in which rate of return was involved since I joined the staff of the Federal Power Commission.

I supervised the preparation of a report entitled "Rate of Return Study, Part II," in Dockets G-109 and G-112, which you have just handed me.

(At this point, counsel for the Commission requested that the document just referred to by the witness be marked for identification. At the direction of the Examiner, the document was marked Exhibit 186 for identification.)

Cross-Examination Interposed by Mr. Morgan.

Exhibit 186 was prepared by members of my staff under my direction. That is the usual way of preparing this sort of material. Of course, I participated more actively in some of the exhibits than I did in others. I outlined the entire scheme of the exhibit, I told them just exactly what I wanted and how it was to be prepared. In some instances I partake in the preparation much more than others. That is, my directions are followed out by men who have made similar studies in the past. I rely on those working under me to obtain the facts and for mathematical accuracy particularly.

Direct Examination by Mr. Slaff Resumed.

In broad outline, the report is divided into two sections: the first section comprising Schedules 1 to 4 and Charts 1 to 3, inclusive, is designed to give a statistical picture of the natural gas industry in the United States, particularly by showing the volume of transactions during the last several years; the second section consisting of related Schedules 5, 5-A, 5-B, 5-C, 5-D, 5-E, 5-F, 5-G, 6, 7 and 8 and Chart 4, deals with certain financial aspects of natural gas companies, particularly matters relating to the securities of such companies.

Schedule No. 1 shows certain revenue and customer statistics for the years 1929 to 1938, inclusive. The schedule is divided into three sections, the upper section dealing with revenues, the middle section relating to cubic feet of gas sold, and the lower section relating to customers.

It will be seen by scrutinizing the upper section that total revenues increased from $376,000,000, in round figures, in 1929 to $419,000,000, in round figures, in 1938, a substantial increase. During the depression years, the revenues from sales of gas were off, the low point being reached in 1933; then a general recovery set in and total sales in 1938 were the highest in the period portrayed,
1494 except for the year 1937. The year 1937 was generally a better business year than 1938, so that the decrease in sales in 1938 from 1937 conformed substantially to the general business trend.

The latest figures released by the American Gas Association show total revenues of $253,700,000, in round figures, for the six months ended June 30, 1939. This amount was 8.3 per cent above total revenues for the first six months of 1938, and 2.5 per cent above the like period of 1937.

The revenues from sales to domestic customers amounted to $223,000,000 in 1929 and $244,000,000 in 1938—again a substantial increase. The domestic sales followed the trend of total sales quite generally. Commercial sales, unlike domestic and total sales, did not decrease during the depth of the depression but instead steadily increased except for a rather minor decline in 1938. The total commercial sales were, in round figures, $32,000,000 in 1929 and $47,000,000 in 1938. As was to be expected, industrial sales fluctuated a great deal with the change in economic conditions. The sales of $117,800,000, in round figures, in 1929, decreased to a low of $74,100,000, in round figures, in 1932. There was a recovery, however, the high point being reached in 1937 when such sales amounted to $143,800,000. In 1938, industrial sales amounted to $125,000,000, being off from 1937 and slightly under the sales of 1936. Miscellaneous sales, I believe, need no explanation.

It will be noted that the annual revenue per thousand cubic feet of gas sales amounted to 38 cents in 1929 and 34.9 cents in 1938. The revenues per thousand cubic feet have varied somewhat from a high point of 41.1 cents in 1932 to a low of 33.7 cents in 1937. Under the heading

"Domestic," it will be seen that the average revenue per thousand cubic feet in 1929 amounted to 66.7 cents whereas in 1938, the corresponding revenue was 70 cents. The revenue per thousand cubic feet of gas sold under the category of commercial sales has generally declined from 1929 to 1938—the average revenue per thousand cubic feet was 55.5 cents in 1929, whereas the pertinent figure for 1938 was 47.6 cents. Industrial sales have varied from a high point of 20.1 cents in 1929 to 16 cents in 1934; the 1938 figure being 17 cents.

The middle section of that Schedule No. 1 shows the quantity of gas sold. The total sales in thousands of cubic feet for 1929 amounted to 991,000,000, the low point being reached in 1932 when 834,000,000 M. cubic feet were sold.

Thereafter, increased sales were reflected, the high point being reached in 1937, when 1,316,000,000 M. cubic feet were sold. The sales for 1938 amounted to 1,200,607,000 M.C.F. The sales to domestic consumers in 1929 amounted to 335,400,000 M.C.F. The low point for the period, 1933, reflected 300,200,000 M.C.F., after which the sales increased, reaching a high figure in 1937 of 360,200,000 M.C.F. The figure for 1938 was 349,200,000 M.C.F. The sales to commercial customers have increased very substantially in the period under review, the sales being 58,600,000 M.C.F. in 1929, 103,300,000 M.C.F. in 1937, and 99,800,000 M.C.F. in 1938. The sales to industrial customers amounted to 585,000,000 M.C.F. in 1929, after which they declined, reaching a low point of 427,000,000 M.C.F. in 1932, a high point of 836,000,000 M.C.F. in 1937, and 736,000,000 M.C.F. in 1938.

1495 The total sales per customer were 173.7 M.C.F. in 1929 and 170.7 M.C.F. in 1938—a slight decrease. During the interim, the sales decreased and then increased, reaching a high point in 1937 when the annual sales per customer were 191.9 M.C.F. The sales to domestic customers per customer generally declined from 1929 to 1938, although there was a slight increase from the low point of 52.4 M.C.F. in 1934 to 53.6 M.C.F. in 1938. The sales per commercial customer were 184.8 M.C.F. in 1929 and outside of a slight decline for 1930 and 1931 have increased, reaching a high point of 222.0 M.C.F. in 1937 and dropping off to 207.6 M.C.F. in 1938. The average annual sales per industrial customer in terms of volume have varied rather considerably, as would be expected. The sales amounted to 30,642.5 M.C.F. in 1929, reaching a low of 17,393.9 M.C.F.

in 1932, a recovery to 24,592 M.C.F. in 1936 and with average annual sales of 19,846 M.C.F. per industrial customer in 1938.

The lower section of the schedule contains statistics appertaining to average number of customers during each year of the period under review. The total number of customers has generally trended upward from 1929 to 1938, the number being 5,703,000 in 1929 and 7,033,700 in 1938. The average number of domestic customers has increased, the figure being 5,300,000 in 1929 and 6,500,000 in 1938. The number of commercial customers has followed the trend of the total and of domestic customers, the average being 317,000 in 1929 and 481,000 in 1938. The average number of industrial customers has likewise increased during the period from the low of 19,000 in 1929 to 37,000 in 1938. That is almost double.

The average annual revenue per customer for all customers for the year 1929 amounted to $65.97 and in 1938, $59.64, somewhat of a decrease. For domestic customers, the pertinent figure for 1929 was $41.65 and for 1938, $37.52, the 1938 figure still being under the 1929 amount. The average revenue per commercial customer was $102.64 in 1929 and $98.93 in 1938, a slight decrease. This slight decrease took place while the sales to commercial customers increased substantially in volume and, as shown in the top section of the schedule, was accompanied by a decrease in average revenue per M.C.F. The revenue per industrial customer has quite naturally fluctuated considerably, the figure being $6,170.00 in 1929 and $3,372.00 in 1938. Thus, while industrial sales have increased substantially in volume, there has likewise been a substantial increase in the number of customers, although, at the same time, the average revenue per M.C.F. for industrial customers has fallen from 20 cents in 1929 to 17 cents in 1938.

Cross-Examination Interposed by Mr. Morgan.

No, I do not realize that practically none of the gas that is sold by defendants was included in those figures. You are correct. The exhibit does not include the figures of companies who sell mixed gas. It is confined to companies which sell natural gas only.

Direct Examination by Mr. Slaff Resumed.

1496 I would like to state that the source of the information is generally given at the bottom of each schedule.

Schedule 2 shows the condensed income accounts of the natural gas industry for the years 1931 to 1937, inclusive. The revenues from sales to customers for each of the years from 1931 to 1937 are somewhat lower than the totals shown on Schedule 1, from which I would surmise that statistics for a few companies included in Schedule 1 are not included in Schedule 2. The differences, I might say, are relatively minor and do not affect the comparisons which are shown in Schedule 2.

I would like to call attention to items on Schedule 2. The first is net operating income which amounted to $111,264,000 in 1937, $109,108,000 in 1936, $93,050,000 in 1935, $71,029,000 in 1934, $64,840,000 in 1933, $76,092,000 in 1932 and $83,588,000 in 1931. It will be seen that the operating income in 1937 is higher than for any previous year shown in the schedule and is substantially higher than net operating income for 1931. The other item to which I would like to call attention is income available for dividends and surplus. Such income was $74,623,000 in 1937, $68,866,000 in 1936, $55,981,000 in 1935, $31,337,000 in 1934, $26,796,000 in 1933, $43,873,000 in 1932 and $50,816,000 in 1931. Again it will be seen that the net income available for dividends and surplus was substantially higher in 1937 than in 1931, and that 1937 was higher than any other year portrayed in the schedule. The amount of fixed capital is given for the years 1934 to 1937, inclusive, and it will be seen that the fixed capital increased about $83,000,000 between those years.

I would like to state that I do not have figures for years prior to 1931, and that is the reason I did not include them in this report. For fixed capital the figures that I have available go back only to 1934.

Both of these pages of the exhibit have to do with retail sales of distribution companies. The fixed capital figure is a figure for gross fixed capital.

Chart 1 shows in graphic form the monthly sales and revenues of the gas industry. The top lines on the left-hand side of the sheet show total revenues from both manufactured and natural gas industries by months for the years 1929, 1937 and 1938. The 1938 line is an unbroken line. The 1937 line is a dotted line. The 1929 line is a dashed line.

It will be seen that the revenues for the three years mentioned clearly approximate each other. In the lower section on the same chart, revenues from the sale of manufactured gas for 1929, 1937 and 1938 are indicated. On the chart to the right are sales of natural gas in billions of cubic feet. Thereunder, the revenues for the natural gas industry are portrayed for the years 1929, 1937 and 1938. It will be seen that the business of natural gas companies is somewhat more seasonal than that of the manufactured gas companies and it will also be seen that the revenues from the natural gas business are somewhat higher than revenues from the sale of manufactured gas.

1497 Chart 2 has to do with distribution companies. In this first section you have to consider the charts together in order to get a proper picture of the natural gas industry. You see you do not have quite the volume of statistics in the natural gas industry that I would like to have, chiefly because we haven't had the regulation of the interstate movement of natural gas. In a couple of years I am sure we will supply that need. I think you must consider all these charts together in order to get the proper picture. Chart 2 has been included in the exhibit for the purpose of giving some information as to the trend of sales in 1939. That chart shows the monthly revenues for 1938 broken down into classifications of total, domestic, industrial and commercial. The revenues up to July, 1939, are shown by the same classifications. It will be seen that the revenues for 1939 are higher than those for the year 1938.

Chart 3, which is taken from the Annual Statistics of The Natural Gas Industry in 1937, issued by the American Gas Association, compares natural gas sales with manufactured gas sales and industrial activity. The line portraying industrial activity is taken from the Standard Statistics index of industrial activity. All of the lines on the graph are chained together in 1926 which is taken as 100. It will be seen that the sales of natural gas have exceeded sales of manufactured gas since that date and that both the sales of natural gas and manufactured gas have not been accompanied by as great a decline as experienced by the industry in general during the depression years.

The caption on the chart, "Stability of the Gas Industry compared with General Industrial Activity," is the American Gas Association's caption.

I took that chart from the statistics for the year 1937 and carried it down to 1938. I would like to add that we have added the year 1938 in ink on the chart. It does not show it separately, but it has been added in ink from the publications of the American Gas Association. This chart is shown on page 4 of Exhibit 179, which is Statistical Bulletin No. 37, issued in October, 1939, by the American Gas Association.

It is my understanding that Charts 2 and 3 also have to do with gas distribution.

Schedule 3 shows natural gas production, consumption and transportation in the entire United States for the years 1926 to 1937, inclusive. On this schedule, column (b) shows the production; column (c) shows the consumption, which is exclusive of the gas used for field operations and manufacture of carbon black; column (d) shows the amount of gas transported in interstate commerce; column (e) shows the percentage of total consumption, transported in interstate commerce; and the final two columns show the total number of states in which gas was produced and consumed.

Here I am dealing with production and transmission of natural gas and not with distribution, as heretofore.

It will be seen from Schedule 3 that in 1937 approximately 48 per cent of the total natural gas consumed
1498 was transported in interstate commerce. Heretofore such transactions in interstate commerce have generally not been subject to regulation, but since the passage of the Natural Gas Act, this condition has been changed. The schedule shows very clearly the importance of natural gas as a commodity of interstate commerce.

I show the sources of the data at the bottom of the schedule.

I do not know offhand which two states in 1931 quit producing gas. There were 26 producing in 1929 and 1930 and since then only 24 have been producing gas.

Schedule 4 has been compiled for the purpose of showing the natural gas transported into the State of Illinois from other states. It shows that no gas was transported into the State of Illinois from other states in the year 1928; a relatively small amount from the State of Louisiana in 1929 and a substantial amount from Louisiana in

1930; in 1931 substantial amounts of gas were imported into Illinois from Texas and Louisiana; and in 1937, of a total of 77,610,000 M.C.F., 56,957,000 M.C.F. came from Texas, 17,367,000 M.C.F. from Louisiana, 2,973,000 M.C.F. from Kansas, and 313,000 M.C.F. from other states than those mentioned.

The sources of the data shown in Schedule 4 are given in the footnote.

Beginning with Schedule 5 of Exhibit 186, we show data relative to security issues of certain natural gas companies. The companies included in Schedule 5 were all the companies I could find which had the following characteristics:

(1) Were engaged in the production and transmission of natural gas; or

(2) Were engaged in the transmission of natural gas; and

(3) Had operating revenues in 1938 of $2,500,000 or more.

In taking those companies which had $2,500,000 revenue or more, my general purpose was to try to get companies which were somewhat comparable with the companies involved in the present proceeding, and the companies with annual revenues of less than $2,500,000 would not, in my opinion, be comparable. We did not pick and chose among the companies with revenues of $2,500,000 or more. We took all the companies which I could find which had the characteristics I have just mentioned. I mean they had to be engaged in production and transmission, or transmission by itself. They had to have those characteristics. They could have distribution, but they had to have transmission. They could have production as well.

I have not made any calculation as to the number of companies shown on this list which have more securities outstanding than Natural Gas Pipeline Company of America. I will do that before I return for cross-examination.

On Schedule 5 there are shown for each of the 31 companies having the characteristics previously described, the total amount of securities outstanding and the amount of those securities held respectively by the public, by institutions and by affiliates. By institutions, I mean
1499 banks, insurance companies, universities, etc. The information as to securities outstanding is as of the latest dates for which we could obtain the pertinent in-

formation. Some of the information is as of a recent time, some as of December 31, 1938, and, in a few instances, as of December 31, 1937.

On Schedule 5-A, there is given certain information relative to bonds, debentures and notes of the companies held by the public.

On Schedule 5-B are shown the holdings of bonds, debentures and notes of the companies by institutions.

On Schedule 5-C, the holdings of bonds, debentures and notes by affiliated interests are set forth.

On Schedule 5-D, certain information relative to public holdings of preferred stock of the companies is portrayed. That schedule will be explained subsequently.

Schedule 5-E shows the holdings of preferred stocks by affiliates.

Schedule 5-F shows market value and other data relative to common stocks held by the public, whereas Schedule 5-G shows the common stocks held by affiliates.

I would like to state that Schedules 5-A to 5-G, inclusive, are tied in with and, in a sense, support Schedule No. 5. As to Schedule No. 5 itself, the sources of information are not disclosed, because the sources were varied. We have work papers supporting the information, which will be gladly made available.

(EXHIBIT 156 for identification, received in evidence, subject to counsel for complainant supplying a properly certified copy in lieu of the document admitted. Motions to strike Exhibits 141 and 142 by Commission counsel denied.)

(EXHIBIT 184 for identification, offered and received in evidence.)

I have prepared in narrative form a statement with respect to each of the companies shown in Schedule 5 and have handed that statement to the reporter with the request that it be incorporated in the record as my statement with respect to that schedule.

(At this point the Examiner directed the reporter to copy into the record, from the typewritten document handed the latter by the witness, pages 15 to 30, inclusive, and the first half of page 31. The statement follows:)

1500 The Arkansas-Louisiana Gas Company is engaged in the production, transmission and distribution of natural gas. Its sources of supply are Monroe, Richland and Elm Grove fields in Louisiana and certain other fields in Texas and Arkansas.

The company supplies natural gas to a larger number of communities in Arkansas, Louisiana, and Texas. The principal communities served at retail are Little Rock, Arkansas, Shreveport, Louisiana, and Texarkana, Texas. Gas is sold at wholesale to, among others, Consumers Gas Company for distribution in the City of Hot Springs, Arkansas, and to other companies for distribution in two smaller communities in Arkansas.

The company has 1,371 miles of transmission lines and has about 10 compressor stations with an aggregate rated capacity of 26,390 h.p. The First Mortgage, 2¾% 1940-1944 bonds in the amount of $3,300,000 were held, it is indicated by page 1 of Schedule 5, by institutions. Referring to page 1 of Schedule 5-B, it will be seen that the $3,300,000 First Mortgage bonds just mentioned are held by the Guaranty Trust Company of New York and by the Central Hanover Bank & Trust Company, the former owning $2,800,000 of the bonds and the latter, $500,000 thereof. The First Mortgage, 3½% 1945-1954 bonds in the amount of $9,700,000 were also owned by institutions, as is indicated by Schedule 5, and Schedule 5-B shows that the entire issue was owned by the following institutions in the amounts indicated:

Equitable Life Assurance Society of U. S.	$4,850,000
Metropolitan Life Insurance Company	3,550,000
Massachusetts Mutual Life Ins. Company	400,000
Sun Life Assurance Co. of Canada	350,000
Teachers Ins. & Annuity Assoc. of America	300,000
Provident Mutual Ins. Co. of Philadelphia	250,000
	$9,700,000

The $6,500,000 of Debentures shown on Schedule 5 were all held by the Arkansas Natural Gas Corporation as is shown on page 1 of Schedule 5-C. Common stock of the company outstanding was 298,988 shares of a par value of $50 each or an aggregate book amount of $14,949,400. All of the common stock was held by affiliates and Schedule 5-G indicates that the entire issue in question was owned by the Arkansas Natural Gas Corporation.

The next company is the Canadian River Gas Company. That company is engaged in the production and transmission of natural gas. Its source of supply is the Texas Panhandle field, and its main line extends from that field to a point near Clayton, New Mexico. As has been shown by testimony in this proceeding, the Canadian River Gas

Company supplies 25% of the gas requirements of the Natural Gas Pipeline Company of America. The company owned 98 miles of trunk lines of various sizes at the end of 1938. The first Mortgage 6% Bonds in the amount of $6,244,000 of the Canadian River Gas Company are all owned by the Colorado Interstate Gas Company, as shown by page 1 of Schedule 5-C. The entire common stock of the company, having book amount of one dollar, was owned by the Southwestern Development Company, as is shown by Schedule 5-G.

1501 Chicago District Pipeline Company. This company is engaged in the purchase, transmission and sale of natural gas. Its gas transmission system appears to consist of approximately 43 miles of 24-inch pipeline from Joliet, Illinois, to a point of connection with one of the Peoples Gas Light & Coke Company's transmission mains on the southern limits of the City of Chicago; approximately 1.3 miles of 20-inch pipeline from the company's 24-inch system to a point on the Illinois-Indiana State line; approximately 31 miles of 24-inch pipeline and 4 miles of 20-inch pipeline forming a connection with one of the Peoples Gas Light & Coke Company's transmission mains on the western limits of the City of Chicago. I believe it has been shown by testimony in this proceeding that the Chicago District Pipeline Company purchases its gas requirements from the Natural Gas Pipeline Company of America. The largest sales by the Chicago District Pipeline Company are to the Peoples Gas Light & Coke Company. The notes payable of the company in the amount of $2,769,897 were owned by the Natural Gas Investment Company, as shown by Schedule 5-C. The common stock, consisting of 1,000 shares of no par value, with book amount of $10,000, was all held by the Natural Gas Investment Company, as indicated by Schedule 5-G.

Cities Service Gas Company. This company is engaged in the production and transmission of natural gas. It obtains its gas from a number of fields in Texas, Oklahoma, and Kansas, including particularly, the Panhandle field in Texas and the Oklahoma City and Seminole fields in Oklahoma. The company's system consists of 4,273 miles of pipeline and 29 compressor stations. Gas is sold at wholesale to distributing companies serving 229 communities, including Kansas City, St. Joseph, Springfield, and Independence, Missouri; Bartlesville, Oklahoma, and Kansas City, Leavenworth, Topeka and Wichita, Kansas.

The company has outstanding First Mortgage 3¼% and 3¾% bonds due 1940-1954 in the amount of $35,000,000 all of which bonds are held by institutions, as shown on page 1 of Schedule 5-B. $20,000,000, consisting of 3¾% bonds, are owned outright by four banks and two insurance companies, and the remaining $15,000,000, 3¼% bonds, are held as collateral for loans. The $8,000,000, Debentures, 5½%, 1956, are held by the Cities Service Company and subsidiaries, as shown by Schedule 5-C. The common stock of the company consisting of 300,000 shares of no par value is all held by the Empire Gas & Fuel Company, as shown by Schedule 5-G. The Empire Gas & Fuel Company, I might state, is owned 100% by Cities Service Company and certain of its subsidiaries.

Colorado Interstate Gas Company: The Colorado Interstate Gas Company is engaged in the transmission of natural gas. The main transmission system of the company extends from a point near Clayton, New Mexico, to Denver, Colorado, a distance of 254 miles. The company also has 165 miles of branch lines connecting with the main system at different points along the line. The company acquires its gas from the Canadian River Gas Company, described heretofore. The First and Collateral Trust, 3½%'s, 1948, in the amount of $10,898,000 were held partly by institutions and partly by affiliates. As shown on Schedule 5-B, the Mutual Life Insurance Company of New York owned $4,865,000 of such bonds and, as shown on Schedule 5-C, the Imperial Oil Ltd. and Standard Oil Company of New Jersey owned $6,033,000 of the bonds outstanding. Of the preferred stock of the company consisting of 6% par value $100, $2,000,000 in amount, the entire issue was owned by the Standard Oil Company
of New Jersey and Consolidated Oil Corporation in
1502 equal amounts, as is shown by Schedule 5-E. The
common stock of the company consisting of 1,250,000 shares of no par value was owned by the following companies in the proportions indicated, as is shown by Schedule 5-G:

Southwestern Development Company	42½%
Standard Oil Company of New Jersey	42½%
Public Service Company of Colorado	15%

East Ohio Gas Company. This company is engaged in the production, purchase, transmission and distribution of natural gas. The company supplies the gas requirements in Cleveland and in many other cities and towns in eastern and northern Ohio. It has over 6,000 miles of pipeline. The preferred stock of the East Ohio Gas Company is owned by the Standard Oil Company of New Jersey, as is shown by Schedule 5-E, and the common stock is all owned by the same company, as is indicated by Schedule 5-G.

The El Paso Natural Gas Company is an operating and holding company. It purchases gas from producers in southeastern New Mexico. The company and its subsidiaries are engaged in the business of purchasing natural gas from producers in New Mexico, transmitting it through a pipeline system and selling it at wholesale to public utility and industrial customers located principally in or near El Paso, Texas; Hurley, New Mexico; Phoenix, Arizona; etc. The pipelines of the company and its subsidiaries consist of 1,331 miles, including duplicate lines, branch lines and gathering lines. The First Mortgage, 3½% bonds of the company in the amount of $6,000,000 are held by the following institutions, as is shown by page 1 of Schedule 5-B.

Sun Life Assurance Co. of Canada	$ 891,102
Equitable Life Assurance Society of U. S.	2,250,000
Massachusetts Mutual Life Ins. Co.	275,000
Metropolitan Life Ins. Co.	2,000,000
Mutual Life Ins. Co. of New York	475,000
	108,898
	$6,000,000

The serial notes in the amount of $3,480,000 were all owned by The Chase National Bank, likewise as is shown by Schedule 5-B. All of the preferred stock of the company, consisting of 7% Cumulative, par value $100, was owned by the public and the common stock of the company was likewise held by the public.

Equitable Gas Company. This company is engaged in the production, purchase, transmission and distribution of natural gas. The company's production properties are in western Pennsylvania, but the major portion of its natural gas is obtained from the parent company, Pittsburgh & West Virginia Gas Company, which in turn obtains gas from West Virginia and eastern Kentucky. The company produces, transports, and distributes natural gas in the western part of Pennsylvania, including particularly Pittsburgh and cities in the vicinity. The notes of the company outstanding in the amount of $13,540,408 are all held by affiliated companies. The common stock of the company was held by Pittsburgh & West Virginia Gas Company.

The Hope Natural Gas Company is engaged in the production, purchase, transmission and distribution of natural gas. It is one of the oldest and most important 1503 gas subsidiaries of the Standard Oil Company of New Jersey in the Appalachian field. The company's operations are confined to the State of West Virginia, but its main outlet are sales to the East Ohio Gas Company which operates in the State of Ohio, and to the Peoples Natural Gas Company which operates in the State of Pennsylvania, both of which companies are likewise subsidiaries of the Standard Oil Company of New Jersey. The only security outstanding of the Hope Natural Gas Company was common stock, all of which was owned by the Standard Oil Company of New Jersey.

The Houston Gulf Gas Company is engaged in the production, purchase, transmission and wholesale distribution of natural gas. The principal producing properties of the company are located in south Texas. The main pipelines extend from the field in south Texas to Houston, Texas, and industrial areas in that vicinity. Pipelines of the company aggregate 482 miles. The company sells at wholesale substantially all requirements of about 18 communities in southern Texas. The company is also engaged in the production, transportation and sale of a limited amount of crude oil. The bonds and debentures of the company, as shown by Schedule 5, were largely held by the public. The notes were held by an affiliate, United Gas Pipe Line Company, as shown by Schedule 5-C. The preferred stocks were largely held by an affiliate, United Gas Corporation. Most of the common stock of the company was held by the United Gas Pipe Line Company, as shown by Schedule 5-G.

The Indian Territory Illuminating Oil Company is engaged in the production of oil and natural gas and the transmission of natural gas, and is an operating as well as a holding company. The transmission lines of the company connect with other subsidiaries of the Cities Service Company. Its outstanding notes were held by affiliates and by a bank, and some of its common stock was held by the public, although the majority was held by Cities Service Company, and Empire Gas & Fuel Company, as shown by Schedule 5-G.

The next company is Interstate Natural Gas Company, Inc., whose securities outstanding consisted of common stock, some of which was held by the public but most of which, however, was held by Standard Oil Company of New Jersey and the Columbian Carbon Company, as indicated by Schedule 5-G. The Interstate Natural Gas Company, Inc., owns 170 miles of main pipeline, 22 inches in diameter, running from the Monroe gas field in northern Louisiana to Baton Rouge, Louisiana. It serves at wholesale companies supplying natural gas to Natchez and Baton Rouge, and it connects at Baton Rouge with a pipeline of the United Gas Pipe Line Company, which supplies gas to the City of New Orleans.

The Iroquois Gas Corporation is engaged in the production, purchase, transportation and distribution of natural gas and manufactured gas. The company's operations are confined to the western part of New York State. The company's outstanding securities, consisting wholly of common stock, were all held by National Fuel Gas Company, as is shown by Schedule 5-G.

The Lone Star Gas Company is engaged in the production, purchase, and distribution of natural gas and also, somewhat, in the production of crude oil. Its transmission lines are in two service groups—(1) a main group extending from the southeastern extremity of the Texas Pan-
1504 handle to Fort Worth and Dallas, where it connects
with transmission and distribution lines which extend through the central part of Texas and southern Oklahoma. The company distributes gas directly in Fort Worth. (2) The secondary groups extends in a southwesterly direction from Brownwood, Texas, to San Angelo, Texas, etc. The company owns 4,384 miles of mains and field lines and 21 compressor stations. The company has outstanding mortgage notes in the amount of $214,100, all of which were held by the public, and 4½% notes, 1953, in the amount of $19,600,000 which were held by the Lone Star Gas Corporation, parent company, as shown by Schedule 5-C. All of the company's outstanding common stock was held by the same parent company, as indicated by Schedule 5-G.

The Manufacturers Light and Heat Company is engaged in the production, purchase, transmission and distribution of natural gas. The company distributes gas in western Pennsylvania, northern West Virginia, and eastern Ohio. Important cities in which the company distributes gas include Pittsburgh, New Castle and Washington, Pennsylvania; Steubenville and East Liverpool, Ohio; and Moundsville, West Virginia. It obtains its supply in southwestern Pennsylvania, West Virginia and Ohio. The company's notes payable of $360,000 and practically all of the common stock having a book value of $22,530,400 is held by Columbia Gas & Electric Corporation.

The Memphis Natural Gas Company is engaged in the purchase and transmission of natural gas. The company's main pipeline extends from the Monroe field in Louisiana to Memphis, Tennessee, a distance of 402 miles. All of the notes of the company were held by institutions and somewhat more than half of the common stock of the company was held by the public while the remainder was held by affiliates.

Unless there is some objection, or unless some question arises concerning a particular company, from now on I will not describe the institutional or the affiliated holders of the securities of the various companies. Such information is shown in detail in Schedules 5-B, 5-C, 5-E and 5-G.

The Mississippi River Fuel Corporation is engaged in the transmission of natural gas. The company owns and operates 450 miles of main pipeline from Louisiana to St. Louis, Missouri, together with main compressor stations and branch pipelines incidental to the delivery of natural gas to industrial consumers and to distributors to communities along the route. All of the first mortgage bonds of the company were held by institutions. The 6%, 1940, notes were held by affiliates and all the common stock was held by affiliates.

The Mountain Fuel Supply Company is engaged in the production, transmission and sale of natural gas. The company's sources of supply are chiefly in Colorado, Utah and Wyoming, and it has 530 miles of transmission lines. Principal cities served by the company are Salt Lake City and Ogden, Utah. The common stock of the company outstanding was of the book amount of $19,899,025, $15,090,455 of which was owned by the public and the balance by affiliates.

The Natural Gas Pipeline Company of America is one of the companies involved in the present proceeding, and I believe an adequate description of its facilities is included in the record; suffice it to say at this time that the company's bonds and stocks are all owned by affiliates.

1505 The Northern Natural Gas Company is engaged in the production, purchase, transmission and distribution of natural gas. The company and subsidiaries own and operate approximately 2,200 miles of natural gas transmission lines, extending from the Texas Panhandle and Hugoton, Kansas, fields to South Dakota and Minnesota. The main transmission lines are largely 24 inches in diameter. Natural gas is sold principally at wholesale in Iowa, Kansas, Nebraska, South Dakota, and Minnesota. Cities supplied at wholesale include Omaha and Lincoln, Nebraska; Council Bluffs, Des Moines, Sioux City, Mason City and Fort Dodge, Iowa; Sioux Falls, South Dakota; and Minneapolis and Rochester, Minnesota. The First Mortgage, 3¼%, 1954, bonds of the company were all held by institutions. The bonds were sold to the institutions in August of this year. The common stock of the company was all held by three affiliates.

The Ohio Fuel Gas Company is engaged in the production, transmission and distribution of natural gas. The company has the most extensive gathering, transmission and distribution system in the State of Ohio. It supplies some 300 cities and towns in that State. The 4% notes, 1940-1946, were held by institutions and other notes aggregating $6,734,363 were held by affiliates. All of the common stock of the company was likewise held by an affiliate, Columbia Gas & Electric Corporation.

The Oklahoma Natural Gas Company is engaged in the production, transmission and distribution of natural gas. The company has 2,182 miles of pipeline. It obtains its supply of gas in Oklahoma, and ⅓ of the business of the company in terms of volume of gas sold is in Tulsa and vicinity and another ⅓ in Oklahoma City and vicinity. The First Mortgage 3¾%, 1955, bonds of the company were all held by the public and were issued in August of this year. There were also outstanding bank loans in the amount of $8,000,000, which were held by institutions. The two issues of preferred stock were held by the public and the common stock was likewise held by the public. The stock of the company was formerly owned by the Gas Utilities Company, which company was dissolved in 1936, and the common stock of the Oklahoma Natural Gas Company was distributed to approximately 2,500 stockholders of the Gas Utilities Company.

The Panhandle Eastern Pipe Line Company is engaged in the production, transmission and distribution of natural gas. The company owns a natural gas transmission system extending from the Amarillo gas field in the Texas Panhandle through Oklahoma, Kansas, Missouri and Illinois to a point near Dana, Indiana, adjacent to the Illinois-Indiana State line. The major portion of the gas transmitted is sold at wholesale to other gas transmission and distributing companies, the balance is sold to industrial consumers. The principal distributing company served is the Michigan Consolidated Gas Company which supplies gas to customers in Detroit, Michigan, and vicinity. The company's transmission system consists of approximately 2,100 miles of pipeline. The First Mortgage, 4%, 1952, bonds of the company are owned in part by the public, but largely by institutions. The bonds were issued in March, 1937. There was outstanding bank loans in the amount of $2,000,000. The preferred stock, both Series A and Series B, was all held by the Columbia Oil & Gasoline Corporation, and the common stock was held by the Columbia Oil & Gasoline Corporation and by the Missouri-Kansas Pipe Line Company.

1506 The South Penn Oil Company is engaged in the production of oil and natural gas. The chief sources of supply are Pennsylvania, New York, West Virginia and Kentucky. The only securities outstanding consisted of common stock, book amount of $25,000,000, of which $20,681,425 was owned by the public and the balance by affiliates.

The Southern California Gas Company is engaged in the purchasing, transmission and distribution of natural gas. The company purchases natural gas in California and transports and distributes natural gas to various customers in Los Angeles, San Bernardino, Fresno and other counties in California. The major part of the company's revenue is derived from the distribution and sale of natural gas to domestic customers. About ⅔ of the First Mortgage, 4% 1965, and First Mortgage, 4½%, 1961, bonds of the company outstanding, were held by the public and ⅓ of each issue held by institutions. About ¾ of the 6% preferred stock, par value $25, was held by the public and ¼ by affiliates, whereas all of the 6%, Series A, par value $25, was held by the public. The common stock was all held by the Pacific Lighting Corporation.

The Southern Counties Gas Company of California is engaged in the transmission and distribution of natural gas. The company purchases its gas in California and distributes gas to about 98 cities and towns in that state. The company has about 230 miles of transmission line. Of the First Mortgage, 4½%, 1968, bonds outstanding, $9,432,860 were in the hands of the public, whereas $2,067,140 are held by institutions. All of the common stock was held by the Pacific Lighting Corporation.

The Southern Natural Gas Company is engaged in the transmission of natural gas. The company purchases gas under long term contract from the Monroe and Richland fields in Louisiana and transports gas from those fields to markets in Mississippi, Alabama and Georgia. The main line extends eastward to Atlanta, Georgia, approximately 504 miles. Gas is sold chiefly to 12 distributing companies. The First Mortgage, 4½%, 1951, bonds were held almost equally by the public and by institutions. The First Mortgage, 4½% 1952, bonds were all held by institutions. The Adjustment Mortgage bonds of 1960 were held by the public and affiliates and notes in the amount of $1,475,000 were held by banks. Of the common stock of the book amount of $5,189,776, $2,698,667 was in the hands of the public and the balance owned by affiliates. The Adjustment Mortgage bonds were issued in 1936, pursuant to a reorganization plan to holders of predecessor company's convertible 6% debentures, 1944, and to holders of filed and allowed claims on the basis of $500 of the new adjustment bonds, plus 48 shares of new Class A stock, for each $1,000 principal amount of old debentures and each $1,030 of claims. The Class A stock together with Class B stock was subsequently converted into the presently outstanding common stock.

The Texoma Natural Gas Company is one of the companies involved in the present proceeding and all of the securities of the company, as already shown in the record, are owned by affiliates.

1507 The United Fuel Gas Company is engaged in the production, transmission and distribution of natural gas. The company's production operations are carried on in West Virginia and it supplies natural gas to many communities in that state as well as in southeastern Ohio. The 4% notes of the company, 1940-1946, in the amount of $5,250,000 were all held by institutions and other notes aggregating slightly in excess of $13,000,000 were held by the Columbia Gas & Electric Corporation and all of the common stock was held by the same company.

The United Gas Pipe Line Company is engaged in the purchase, and transmission of natural gas. Gas is purchased principally at the wells in Texas, Louisiana and Mississippi, and is gathered and transported for sale to distributing systems of United Gas Corporation, to industrial corporations, and to others. The company owns 4,743 miles of pipeline in Texas, Louisiana, Mississippi, Alabama and Florida. The company, therefore, has long pipelines serving a very wide territory. All of the outstanding securities of the company were held by affiliates, the debentures and common stock being owned by the United Gas Corporation, and the bonds being held by Electric Bond & Share Company.

The United Natural Gas Company obtains its supply from northwestern Pennsylvania and supplies gas to several towns in Pennsylvania and a large quantity of gas is sold to Iroquois Gas Corporation, an affiliated company, for distribution in western New York. The only security the company had outstanding was common stock, all of which was held by the National Fuel Gas Company.

The summary on page 6 of Schedule 5 discloses that of a total of $418,882,597 of bonds, debentures and notes outstanding of the 31 companies which I have just described, $65,668,459 was in the hands of the public, $153,572,164 was owned by institutions, and the balance, $199,641,974, was owned by affiliates.

The preferred stock outstanding was $60,713,200, of which $34,381,900 was owned by the public, and the balance by affiliates. Of the common stock outstanding, somewhat less than 10%, namely, $54,848,338, was held by the public, and the balance, $503,806,766, was held by affiliates. Of the total securities outstanding, aggregating a book amount of $1,038,250,901, $154,898,697 was in the hands of the public, $153,572,164 owned by institutions, and $729,780,040 owned by affiliates.

The outstanding characteristic of security issues is the large amount of securities owned by affiliated companies in comparison with the small amount owned by the public and institutions. This leads, naturally, to the conclusion that great care must be exercised in selecting samples for the purpose of disclosing what is proper cost of money to any natural gas company in connection with rate of return studies. It will be seen from the summary of Schedule 5 that a fair sample of bonds outstanding can probably be had. Preferred stock outstanding, however, is very minor in amount, being approximately 6% of the total of outstanding securities, and only one-half of this amount is held by the public. When it comes to common stock, the amount outstanding in the hands of the public is so small that erroneous conclusions may easily be drawn from a study of such a meager sample. I would like to reiterate, that the companies included in the study are not handpicked but are all the companies I could find with the characteristics which I have previously mentioned.

By "affiliates" as I used that term on page 6, Schedule 5, I mean corporate stockholders. Of course, some of the bonds held by institutions are held by corporate stockholders, but I mean a broader sense than that. I mean what we ordinarily have in mind by affiliated companies. Affiliated companies is not a term which can be exactly defined. It is defined differently in many statutes but I use the term in the broad sense of being an affiliated company.

I assumed that Columbian Carbon Company, for instance, was an affiliate of Natural Gas Pipeline Company. Columbian Carbon Company owns 2 percent of the stock in the Pipeline Company and also owns a million dollars of bonds of the Pipeline Company. When you consider the historical development of the Pipeline Company, I think you would naturally conclude that Columbian Carbon Company is an affiliated company.

Your suggestion that whenever I find another company owning part of the stock of the company under consideration I have called it an affiliate, is not altogether accurate. Generally, they are gas companies and, generally, if they own a sufficient amount I would consider them affiliated companies. Some of the institutions are likewise corporations but we would not classify those as affiliates. The term "affiliates" is not necessarily confined to gas companies. I think the reading of the list will pretty well explain for itself the list of affiliated companies. One of the reasons we set forth the security holdings in great detail was for the very purpose of showing the degree of affiliation. For instance, Colorado Interstate Gas Company which is shown in Schedule 5-E, the preferred stocks were held 50 percent by Standard Oil Company of New Jersey.

Direct Examination by Mr. Slaff Resumed.

I show in detail the name of each company which I set out as an affiliate with respect to the bonds, debentures and notes of natural gas companies, and the preferred and common stocks of natural gas companies. Those are more specifically shown in detail in Schedules 5-C, 5-E, and 5-G.

In 5-G we also show percentages of ownership of outstanding stocks. Now, you will find in many cases that the percent of ownership is very large, 100 percent in a great many cases. I will repeat, I have used the term in a general sense and not with any exact definition in mind.

Cross-Examination Interposed by Mr. Morgan.

I have had a good deal of experience in trying to define the word "affiliates." When the system of accounts was being drafted I spent days in trying to get a definition which would meet the views of many state accountants. The job was so difficult that we finally defined associated companies and did away with affiliated companies. I am using this term in a broad sense in this report. I realize the difficulties of trying to have an exact definition of what is meant by affiliated companies.

Question by the Examiner.

1509 No, I do not show the dates on which the issues were floated in connection with the holdings by affiliates and the public of preferred and common stock. I do not know how we could get that information. It is difficult to get proper information for the natural gas industry. We have been able to obtain holdings of securities by the public, institutions, and what I term affiliates, from public sources, but you will find by reference to the footnotes in the various schedules that the public sources are varied. You can't find the information at any one place.

Direct Examination Resumed by Mr. Slaff.

Schedule 5-A gives certain financial information relative to the bonds, debentures and notes shown on page 6 of Schedule 5, which securities were held by the public. There are given in that schedule the name of the issuing company, description of the issue, total amount of issue outstanding, amount held by the public, and the total of the amount held by the public will agree with the pertinent figure on page 6 of Schedule 5,—the ratings of Moody's and of Poor's, the times fixed charges earned for 1938, percent of funded debt, to total fixed capital as of December 31, 1938, the high and low quotations for 1937 and 1938, together with the closing price of the latest date available when the schedule was prepared, and, finally, the yield to maturity on the basis of the last quotation, which is contained in the last column on the page.

It will be seen—referring now to the figures in the last column—that the Houston Gulf Gas Company's First and Collateral, 6%'s, were selling on a basis of 5.13% yield to maturity. It should be noted that the quotation was 103½ although the call price was 101½ on September 30, 1939, and it is well known that under such circumstances, the yield to maturity is not a correct portrayal of the proper yield. In other words, when the call price is higher than market, it is well established that the call price is probably holding down the market value.

The Houston Gulf Gas Company's debentures, 6½%, 1943, were selling on a basis of 5.90 as of September 30, 1939. Here again the quotation was 102 whereas the call price was 101½.

No information is available as to the market quotation of the Lone Star Gas Company's mortgage note.

The Oklahoma Natural Gas Company's First Mortgage 3¾%, 1955, was selling on a 3.55% basis to maturity as of September 30, 1939. Incidentally, this issue was sold in August of this year.

The Panhandle Eastern Pipe Line Company's First Mortgage, 4½%, was selling on a basis of 3.63% as of September 30, 1939, and here again the quotation of 103⅞ exceeded the call price of 102½.

The Southern California Gas Company's First Mortgage, 4%'s, 1965, were selling on a basis of 3.70% as of September 30, 1939, and the Southern California Gas Company's First Mortgage, 4½%'s, 1961, were selling on a basis of 4.00% as of the same date. The difference between the yield to maturity on the 4's and 4½'s of the Southern California Gas Company is clearly attributable to the call provisions of the respective issues. The 4's were selling at 105⅝ whereas the call price was 107½, while on the other hand, the 4½'s were selling at 107½ whereas the call price was 104.

1510 The Southern Counties Gas Company of California's First Mortgage, 4½%'s were selling at 4.20% as of October 3, 1939. Once more the market price of 104⅜ exceeded the call price of 101½.

The Southern Natural Gas Company's First Mortgage, 4½%, 1951, bonds were selling at 3.90% and the market price and the call price were equal at 105. The Southern Natural Gas Company's Adjustment Mortgage, 6% bonds, 1960, were selling on October 3 at a yield to maturity of 6.35%.

The weighted average yield on those bonds for which a figure is given in the last column, that is to say the column headed "Approximate Yield to Maturity," was 4.02%. These bonds which I have discussed and which are shown in Schedule 5-A, are the bonds in the amount of $65,668,459 set out on page 6, Schedule 5, that is the bonds, debentures and notes, stated there to be held by the public.

I have explained Schedules 5-B and 5-C in my earlier statement with respect to this exhibit.

Schedule 5-D supports Schedule 5 in that it shows certain information relative to preferred stocks of natural gas companies listed on Schedule 5, and which preferred stocks are held by the public.

Schedule 5-D shows the issuing company, a description of the issue, total amount of each issue outstanding, amount held by the public, Poor's rating, the times dividend requirements earned, the times fixed charges and dividends earned in 1938, the high and low quotations in 1937 and 1938, the latest available quotation we could get at the time the schedule was prepared, and the current yield based upon such 1939 quotations.

While all the information on Schedule 5-D is of interest, I would like to discuss particularly the current yields, that is, the figures in the last column.

The El Paso Natural Gas Company's 7% cumulative preferred stock, par $100, had a yield on September 30, 1939, of 6.48%. We could obtain no market quotations on the two issues of preferred stock of the Houston Gulf Gas Company. Only a very small amount of that stock was held by the public.

The Oklahoma Natural Gas Company's $5.50 preferred stock had a yield on September 30 of 5.26%, whereas the same company's $3.00 preferred stock had a yield on September 30, 1939, of 7.10%.

I would like to call attention to the fact that the Oklahoma Natural Gas Company has a very large amount of funded debt and preferred outstanding, so that the second preferred, the $3.00 preferred, ranks more in the class of common stock than the genuine preferred stock. The total securities of that company are shown on page 4 of Schedule 5.

I believe the bonds, debentures, notes and preferred stock, aggregate 70 per cent of the company's capitalization; that is, the prior preferred stock.

1511 The Southern California Gas Company's 6% cumulative preferred stock had a yield based on market price of September 30, 1939, of 5.00%, whereas the 6% cumulative preferred, Series A, had a yield of 4.96% as of the same date. It will be seen that the weighted average yield on the securities for which a yield is given in the last column, that is to say, the column headed "Current Yield" is 5.35%.

I have previously discussed Schedule 5-E, which shows the holdings by affiliated companies of preferred stocks.

In Schedule 5-F, there is given certain pertinent information relative to the common stock issues of 10 of the 31 companies heretofore mentioned. The stocks of these 10 companies are held in whole or part by the public. The schedule shows the name of the issuing company, the shares and book amount of stock outstanding, total number of shares and respective amounts held by the public, the par value of each issue or designation of no par where that is a fact, earnings per share based on 1938 figures, per share dividends paid in 1938, Poor's rating, high and low market quotations for 1937 and 1938, latest quotations in 1939 which we could obtain at the time the schedule was prepared, and the per cent of 1938 earnings to the latest quotation. I might quote the percentage earnings.

El Paso Natural Gas Company, 8.12%; Houston Gulf Gas Company, no quotation available; Indian Territory Illuminating Oil Company did not have any earnings for its two classes of preferred stock in 1938, although there was a small bid price for each in 1939.

Interstate Natural Gas Company, 9.06%; Manufacturers Light & Heat Company, quotation not available; Memphis Natural Gas Company, 11.89%; Mountain Fuel Supply Company, 8.22%; Oklahoma Natural Gas Company, 10.71%; South Penn Oil Company, 3.69%; Southern Natural Gas Company, 10.15%.

The weighted average of figures shown in the last column, is 7.33%, ignoring, however, the two figures included in parentheses, which figures are negative in character.

I have a little difficulty with South Penn Oil Company. That is a large oil company and it appears to be a large natural gas company; in fact, Standard Statistics Service classifies it as one of the largest natural gas companies east of the Mississippi River, but I have not been able to obtain sufficient information to classify it as a producing and transmission company purely. I have included it and at the same time I will give an average exclusive of the stock of that company. The weighted average is 7.33 per cent including South Penn, and 9.14 if South Penn is excluded. I do not include the Houston Gulf and Manufacturers Light and Heat Company in the average.

I have already explained Schedule 5-G, which shows holdings by affiliates of the common stock of the natural gas companies listed in Schedule 5.

In Schedule 6 we show recent issues of bonds by natural gas companies; by recent issues I mean issues since 1935. The issues are shown by Moody's ratings. For instance, Southern California Gas Company in July,
1512 1935, issued first and refunding mortgage 4% bonds
due 1965, with a rating of Aaa in the amount of $15,000,000.

The net cost to the company was 4.11%. The yield to the public was 3.91% as shown in the last column.

Incidentally, the last quotation we had for that security showed that it was selling on a basis of 3.70% to maturity and was selling above call.

The Arkansas-Louisiana Gas Company issued in 1936, $10,000,000 of bonds with a rating of "A," with a yield to the public of 4.18%. That security was refunded in 1939 as shown by the table when $3,000,000 first mortgage 2¾% bonds and $9,700,000 first mortgage 3½% bonds were issued at 2.75% and 3.50%, respectively. Those refunding issues are shown down towards the bottom of the page.

The Panhandle Eastern Pipe Line Company in March, 1937, issued $24,000,000 of bonds with a rating of "A," and a yield of 4.23% to the public, and those securities were selling on a 3.55% basis, on the latest date for which we could get a quotation, and the market price at that time was above call.

The Oklahoma Natural Gas Company in June, 1936, issued $20,000,000 of bonds with the rating of "Baa," at a yield to the public of 4.64%. In 1939 the same company issued $17,000,000 of first mortgage 3¼% bonds for refunding purposes, at a yield to maturity of 3.46%.

The Southern Natural Gas Company in 1936 issued principal amount of bonds of $15,000,000, rating "Baa," at a yield to the public at maturity of 4.50%. Those bonds were selling at the last quotation we could get, on the basis of 3.90%.

The El Paso Natural Gas Company, in June, 1936, issued bonds in the principal amount of $7,500,000, with the rating of "Ba," at a yield to the public at maturity of 4.6%. Those were refunded in December, 1938, as shown in the lower section of the schedule, by an issue of other bonds yielding 4.20 and 3.59. There were two issues.

The Northern Oklahoma Gas Company—and that is a company which I probably should not have included in this schedule because it has earnings of less than two and a half million dollars, but it was included through an oversight—issued a million dollars of bonds in 1936 at a yield to maturity of 5%.

In the final section of the schedule are shown issues of bonds for natural gas companies, which issues were sold privately and for which we could not get ratings.

Thus, the Mississippi River Fuel Corporation in February, 1937, sold bonds in the principal amount of $10,000,000 at a yield of 4%.

The Southern Natural Gas Company in October, 1937, issued a small amount of bonds, $650,000, at a yield of 4.71%.

1513 The El Paso Natural Gas Company issues have already been described.

The Cities Service Gas Company in December, 1938, issued mortgage bonds in the principal amount of $20,000,000, on the basis of 3.75%.

I have already described the issues of the Arkansas-Louisiana Gas Company in 1939, yielding 2.75 and 3.50%.

The Northern Natural Gas Company, in August, 1939, issued $16,000,000 of first mortgage 3¼% bonds, at a yield to maturity of 3.25%. The average yield of those bonds sold privately, for which no ratings are assigned, was 3.59%.

I did not show the over-all per cent cost to the company for the "A" bonds, the "Baa" bonds, and the "Ba" bonds, similar to the per cent yield to the public. It would vary, of course, but it would be pretty close to the average between the two. It would not be much different. It probably should have been given.

Question by the Examiner.

The time element is an important factor in explaining why the "Baa" Oklahoma Natural Gas Company bonds should yield 3.46 while they have a lower rating than some of the others. You can't compare that issue with "A's" and "Aaa's" because they were prior years. The Oklahome Natural bonds were issued in a very favorable market in August 1939.

Direct Examination by Mr. Slaff Resumed.

Passing now to Schedule 7, we could only find two issues of preferred stock of natural gas companies sold during the period from January 1, 1935, to September 30, 1939, and these were issues of the same company. The Oklahoma Natural Gas Company in October, 1936, issued prior preferred stock at a yield of 6%. In 1939 it issued 5¼ preferred stock to yield 5.29%.

I would like to explain Chart 4 headed "Companies Affiliated (Directly and Indirectly) with Natural Gas Pipeline Company of America and Texoma Natural Gas Company," starting with the bottom, to show at the bottom on the left the Natural Gas Pipeline Company of America, and on the right the Texoma Natural Gas Company. The Columbian Carbon Company owned 2.5298% of the stock of both companies. It also owned over a million and a half of bonds of Natural Gas Pipeline Company. The bonds are in the same percentage.

The Texas Corporation owned 17.5832% of the stock of each of the companies, and owned bonds of the Pipeline Company in the same percentage.

The Standard Oil Company of New Jersey owned 13.3145% of the stock of the Natural Gas Pipeline Company, and the same percentage of bonds of that company.

The Southwestern Development Company owned 13.3145% of the stock of the Natural Gas Pipeline Company, and the same percentage of the bonds of that company, and owned 26.629% of the stock of the Texoma

Natural Gas Company. The Southwestern Development Company owned 100% of the Canadian River Gas Company.

It owned 42½% of Colorado Interstate Gas Company.
1514 And the Standard Oil Company of New Jersey owned 42½% of the stock of the same company, and the Public Service of Colorado owned 15% of the stock of the Colorado Interstate Gas Company.

The Mission Oil Company owned 47.28% of the stock of the Southwestern Development Company, and Consolidated Oil Company owned 51% of the stock of Southwestern.

The Cities Service Company owned 26.629% of the stock of Natural Gas Pipeline Company as well as the same percentage of bonds of that company, and it owned a similar percentage of the stock of the Texoma Natural Gas Company. Cities Service Company also owned 100 per cent of Cities Service Power & Light Company, which in turn owns 100 per cent of Public Service of Colorado. When the term "owns 100%" is used in that connection, I mean 100% of the voting stock.

The Natural Gas Investment Company owned 26.629 per cent of the stock of the Natural Gas Pipeline Company of America, and the same percentage of the bonds of that company, and owned the same percentage of the stock of the Texoma Natural Gas Company.

79.54% of the stock of the Natural Gas Investment Company is owned by the Peoples Gas Subsidiary Corporation, and that company was controlled 100% by the Peoples Gas Light and Coke Company.

14.05% of the stock of the Natural Gas Investment Company was owned by the Public Service Company of Northern Illinois; 99% of the stock of Public Service Company of Northern Illinois was owned by Commonwealth Edison Company, which company owned 100% of the Commonwealth Subsidiary Corporation, and the latter company in turn owning 63% of the Western United Gas and Electric Company, and this last company owned 6.41% of the stock of the Natural Gas Investment Company. The Natural Gas Investment Company also owned 100% of the stock of the Chicago District Pipeline Company.

Schedule 8, as indicated in the heading, shows recent financing by certain affiliates of the two companies involved in this proceeding.

One of the companies, the Standard Oil Company of New Jersey, in May, 1936, issued $30,000,000 of 3% debentures, 1961, at a yield to purchasers of 3.12%. I might state that the figures in parentheses to the far right in the schedule refer to the sources of the information contained in the schedule, and the footnotes are explained on page 2 of Schedule 8.

The same company in May, 1936, issued $55,000,000 of 3% debentures, 1961. Private sale to Rockefeller Foundation at 3.12%. The company, likewise, in July, 1938, issued $50,000,000 of 2¾% 1953 debentures at a yield of 2.83%. In the same month the company issued $31,000,000 of serial notes to yield 2.50%.

The Texas Corporation, in June, 1936, issued $60,000,000 of 3½% debentures, at a yield of 3.50%, and the company in April, 1939, issued $40,000,000 of 3% debentures, at a yield of 2.93%.

1515 The Consolidated Oil Company in June, 1936, issued $50,000,000 of 3½% debentures at 3.67%, and in August, 1938, issued $25,000,000 of debentures at a yield of 3.38%.

The Public Service Company of Northern Illinois, in October, 1938, issued $80,000,000 first mortgage bonds at a yield of 3.34%.

The Commonwealth Edison Company, in June, 1938, issued $33,000,000, 3½% bonds, at a yield to purchasers to maturity of 3.38%. In August, 1938, it issued $33,000,000, 3½% bonds, at a yield of 3.31%. In November, 1938, it issued $34,000,000, 3½% bonds, 3.29%. In June, 1938, it issued $39,083,195 3½% debentures at a yield of 3.50%. In August, 1938, it issued $39,250,000, 3½% debentures at a yield of 3.50%. In December 1938, it issued $24,896,900 of debentures, 3½%, at a yield of 3.50%. In May 1939, the Commonwealth Edison Company issued $114,500,000, 3¼% bonds, to fourteen insurance companies, the bonds selling at 102. The latter issue is not shown on this schedule.

The Peoples Gas Light and Coke Company, in May, 1936, issued $22,000,000 first and refunding mortgage bonds, at a yield of 4.16%.

I would not classify any of the bonds shown on pages 1 and 2 of Schedule 8, as natural gas company securities.

(A[illegible] this point EXHIBIT 186 was offered and received in evidence without objection.)

Generally speaking, I am familiar with the operations of defendants. I have studied the financial reports relative to the transactions, the financial positions of the companies.

I have read considerable testimony in this present case; and in addition I have had a staff of accountants investigating the books and records of the two companies, and that staff has made preliminary reports to me. I have also read summaries of the contracts on file with the Commission by the companies.

Both companies have undoubtedly bad financial structures, although due to the fact that all their outstanding securities are held by affiliates, the problem is not important from the investigator's viewpoint.

Thus, the Texoma Company had outstanding on December 31, 1938, capital stock in the amount of $500,000, and bonds in the amount of $19,650,000.

The Pipeline Company had outstanding as of the same date, capital stock in the amount of $3,000,000, and funded debt in the amount of $46,500,000.

Both financial structures are obviously top-heavy with bonds.

Cross-Examination Interposed by Mr. Morgan.

No, I do not mean that if an investor desires to go into business and use his own money, he is using a bad financial structure. I mean that viewed as a study in financial structures, the financial structures are bad from the viewpoint of corporate entity. If you ignore the corporate en-
1516 tity and go to the fact that all the securities are held by affiliates, then it does not become important. If you look at the Natural Gas Pipeline Company as an operating company, an independent company, its financial structure is bad, but if you look at it as being an ownership by an affiliated company then, of course, the picture changes.

If the owners of that company had issued common stock to themselves, it would not be poorly financed. I mean, particularly, that the company's structure is such that the company could never hope to finance publicly with such a structure. It just couldn't do it. It wouldn't try to do it.

Direct Examination by Mr. Slaff Resumed.

The companies would have no difficulty in financing at a low cost if they restricted their securities to a proper amount with a reasonable ratio of bonds, preferred and common stock. I have not the least doubt that the companies could finance on as favorable, if not a more favorable, basis than any natural gas producing and transmission company in the United States.

Cross-Examination by Mr. Morgan.

I am basing my statement on my experience in making rate of return studies, and all the qualifications I have given here.

I have testified in other rate of return cases. From 1929 to 1936 I testified before the Maryland Commission in all rate cases which the Commission had. I might mention the large ones, the Potomac Edison Company, the Conowingo Power Company, the C. & P. Telephone Company, a couple of cases involving transportation of milk to the City of Baltimore, and the water utility.

I have also testified in the court case involving the C. & P. Telephone Company versus the Public Service Commission of Maryland, tried properly in 1933 before a statutory court in Baltimore, Maryland.

I have testified before the Federal Power Commission in the Albany Lighting Company case, in the Interstate Power Company case, and I have been responsible for the testimony given by members of my staff in the Safe Harbor Water Power Corporation case which was recently heard by the Federal Power Commission.

I do not have any working papers by which I have undertaken to compare the two companies here involved with other natural gas pipeline companies as to financial items. All the financial information was contained in the report. However, as to other facts, we do have information. I have two volumes of information in my office dealing with natural gas companies. One of them is an immense volume which shows all natural gas companies which have responded to one of the orders of the Commission, Order 51 or 53, I forget which, in which we analyze the transactions of the company, give its business, its transmission lines, wholesale and retail sales, et cetera. That information will be available for examination by representatives of defendants.

1517 FRED KLEINMAN, a witness for complainant, testified:

(November 7, 1939)

Direct Examination by Mr. Booth.

My name is Fred Kleinman, I am Chief of Accounts and Finance of the Illinois Commerce Commission.

(At this point the witness handed the reporter a document consisting of a statement of qualifications of the witness which the Examiner directed the reporter to incorporate in the record. The statement follows:)

I graduated from Cornell University, Ithaca, New York, with the degree of Bachelor of Arts in 1913.

Very shortly thereafter I was engaged in the capacity of clerk by the Brooklyn Union Gas Company, in Brooklyn, New York, which company then operated and still operates one of the largest manufactured gas companies in the United States. At that time it had four subsidiary operating gas companies and one subsidiary operating electric company.

During the period of approximately four years that I was with the Brooklyn Union Gas Company I served in various capacities, in the branch offices, and in the general office, and finally became the man responsible for the final clerical approval on the monthly statements prepared by the accounting department for the use of the management, and the annual statements prepared by the company on their various properties, and the annual reports to the Public Service Commission.

In the course of the work I handled routine investigations of many phases of accounting for these utilities and worked on the rate cases then pending, under the supervision of the general auditor.

As part of my duties there I made a regular audit of the main company and its subsidiaries—an internal audit, of course—as to the results of reporting by the various departments which furnish information to the general accounting office, from which data the final accounts are compiled.

In 1917 I left the company and took a position with the National Aniline and Chemical Company. That company was then a recent merger of six of the largest dye stuffs and chemical specialty companies in the United States.

They were doing a gross business in excess of $100,000,000 a year. I was the assistant to Mr. George W. Yates, who had been comptroller of the American Tobacco Company, and who was then engaged by the officers of National Aniline in the installation of a complete accounting and cost accounting system.

As Mr. Yates' principal assistant, I was very thoroughly familiar with the entire procedure of the installation of this new system, as well as investigating the results of the system then being replaced.

At the end of a year Mr. Yates' engagement terminated and there was a change in the officers; I was called to military duty and I left.

1518 Immediately after the War I took a position with the Emergency Fleet Corporation. I was originally assistant local auditor and afterwards the local auditor of the Newark Bay Shipyard of the Submarine Boat Corporation. This was the second largest shipping Board contract in the United States, the largest being the so-called Hog Island plant. I was the responsible accounting official in charge of the work at that yard; I signed checks for all disbursements subject to a counter sign, collected the receipts and handled the accounting. These disbursements ran into hundreds of millions of dollars. The principal work that I was engaged on was a re-analysis of the records of the company leading toward the ultimate settlement of this contract between the Submarine Board Corporation and the Emergency Fleet Corporation, which represented the United States Government. There were, of course, many differences of opinion and many claims and counterclaims arising out of the sudden cessation of this large contract for building 150 vessels and a shipyard to build them, when the entire ship-building program ceased with the termination of the War.

I remained there until the settlement contract was drawn and the work practically abandoned.

I then accepted a position with the firm of Barrow, Wade, Guthrie & Company, public accountants. Barrow, Wade, Guthrie & Company had been the auditors for National Aniline during the period of my engagement there. I knew several of the partners, and some of the men very well, and when I contacted one of the partners for a position with that firm I was immediately engaged.

The firm was engaged in the general accounting practice and had many offices all over the United States, and connections in foreign countries.

While I was employed by that firm I worked on a variety of accounting work, but from about 1925 on I specialized in utility work and principally in the investigation of utilities prior to the purchase of the utility, either as property or as a company, by some banker or some holding company.

The type of utilities covered were manufactured gas, natural gas, electric, telephone, water, street railways—every imaginable type—and the examinations covered companies large and small, and some with well-kept accounting systems, others with very poor accounting systems.

I was with Barrow, Wade, Guthrie & Company continuously for a period of twelve and a half years, that is, until April, 1933.

In April, 1933 I felt that it was advisable to make a change and secured a position with S. D. Leidesdorf & Company, public accountants, in their Chicago office, with the principal activity to advise and consult with the Illinois Commerce Commission, principally again with regard to the electric rate case of the Public Service Company of Northern Illinois which was then pending.

After working for Leidesdorf on Illinois Commerce Commission work until February, 1934, the Illinois Commerce Commission asked that I be transferred to their staff, and I became a member of the staff of the Commerce Commission. In November, 1934, I became Chief Accountant of the Illinois Commerce Commission.

1519 I testified somewhat briefly in the electric rate case of the Public Service Company of Northern Illinois, and at length on operating results in the electric rate case of the Commonwealth Edison Company, the gas rate case of Peoples Gas Light & Coke Company, as well as in other cases of less importance. In the last two cases mentioned, I made an investigation of the operating expenses of those companies for rate-making purposes.

I was also engaged in the investigation initiated by the joint resolution of Congress into the affairs and activities of the telephone industry, my particular part of that investigation being an investigation of the Western Electric, a manufacturing organization which the American Telephone and Telegraph Company owns and controls, and which supplies the Bell Telephone companies with a very substantial part of materials and equipment for operations and for plant construction. That is the investigation conducted by the Federal Communications Commission.

With the Illinois Commerce Commission I am in charge of all accounting work. This includes investigations for rate negotiation purposes as distinguished from formal rate cases. Also, I have made investigations for the Commission on the subject of impairment of capital by payment of dividends, on the cost of property, and on the accounting methods of Illinois utilities. The annual reports filed by utilities are forwarded to my department for review. We have established a detailed audit program and check certain items every year and also every class of report is checked in detail for every company once every few years. This detailed audit reveals inconsistencies which are forwarded to the utility and whenever errors of accounting or reporting are found they are corrected. Certain basic information is compiled by my department and furnished to the Commission or one of its staff.

The Commission has promulgated revised Systems of Accounts on my sponsorship for electric and gas companies. I have been a member of the Committee on Statistics and Accounts for Utility Companies of the National Association of Railroad and Utilities Commissioners since 1935. This Committee, which is a cooperating committee between state and federal agencies, has compiled accounting regulations for gas, electric, telephone and water companies which have been recommended by the Association to the state commissions for adoption and have been widely adopted; Illinois being one of the states.

For the period 1925 to 1933, I was almost continuously in touch with the financing of corporations. Many of the prepurchase investigations led to purchase, and securities were sold. It was part of my regular duties to prepare various pro forma balance sheets reflecting alternative plans for financing. These financings were sometimes of new corporations, sometimes additional issues, sometimes mergers, or reorganizations, and, during the later part of the period, bankruptcy reorganizations. My experience was sufficiently continuous and detailed to permit of critical judgment on the various plans under consideration.

As to my duties relative to finance with the Illinois Commerce Commission, when a company files an applica-

tion with the Commission for permission to issue securities, it is my function, sometimes delegated to my assistant, Mr. Tholin, to hear the case as examiner and ob-
1520 tain full and complete information on the pertinent factors which the Commission will be called upon to consider in passing on the application, and to report to the Commission concerning those matters. These factors are principally and briefly: (1) Are the statutory requirements as to security issues complied with; (2) After the issuance of the proposed securities, will the company have a satisfactory financial structure; (3) If the securities proposed to be issued are fixed return obligations, is the effective rate of interest, determined by the coupon rate and the discount or premium on the bond, reasonably in line with current money market conditions; and in the case of common stock, is the price asked a reasonable one under the circumstances; (4) In the case of acquisitions and mergers involving exchange of securities, or a recapitalization involving an exchange of one type of security for another, is the basis upon which the exchange is supposed to be made reasonable from the point of view of the consumer, the company, and the investors.

The number of financial cases I have handled is quite large, well over one hundred. The amount of securities involved exceeds $500,000,000. The companies are of all types and sizes; the securities are issued by subscription, by exchange, by private sale and by sale to underwriters. In this connection I must keep informed as to the financings of other companies and the trend of money market rates. In connection with my duties on behalf of the Illinois Commerce Commission, involving the issues of securities presented to that Commission for its approval, I determine, on the basis of investigations my staff and I make, whether or not the cost of money to those companies is considered by me to be fair and proper. The cases before the Illinois Commerce Commission involving the issuance of securities and the approval thereof by the Illinois Commerce Commission are referred to me or my assistant as hearing examiners and the Illinois Commerce Commission has at no time recently found it necessary to require bids. Instead they place the burden on the hearing examiner to determine whether in accordance with the evidence presented by the company and his own knowledge of the cost of money under current market conditions, the proposition of financing proposed by the company presents a reasonable cost of money to that company. That investigation is generally conducted either by me directly or under my supervision, in view of my duties as chief of the Accounts and Finance Division of the Commission.

During the course of my accounting and business experience I have had to give consideration to the factors which constitute risk in business. During the periods when I was working for a company, the Brooklyn Union Gas Company, and the National Aniline and Chemical Company, I had excellent opportunities to become familiar with the business process and the way profits and losses come into play. Later when I was auditing or investigating companies, the risks of business became an integral part of my work. The operating results and the risks undertaken by a company must be considered in order to approach the work intelligently even to the extent of contingencies which require the setting up of special reserves or the notation of contingent liabilities appearing as footnotes on the balance sheet.

In finance the questions of risks become especially important because of the implication inherent in financing that the past earnings of a company are an evidence of future expected earnings. The duty of the accountant certifying past earnings is to reveal so-called non-recurring profits and this duty demands a thorough consideration of risks both past and future. For more than 20 years, in connection with these and other problems, I have been giving consideration to risks in business.

1521 I have testified once on the subject of rate of return. That was in the gas rate case involving Peoples Gas Light & Coke Company before the Illinois Commerce Commission. The accounting department of the Commission under my general supervision has for the past year or two been engaged in making an investigation of the books and records, operating income and expenses, fixed capital account and other matters of defendants. I have obtained the earnings of the two companies up to August 31, 1939. I have prepared an exhibit setting forth the condensed comparative statement of combined profit and loss for eight months ended August 31, 1939, and 1938.

(At this point counsel for complainant requested that the document referred to by the witness, entitled "Comparative Statement of Combined Profit and Loss for 8 Months Ended August 31, 1939 and 1938," be marked for identification. At the direction of the Examiner the document was marked Exhibit 187.)

The figures in Exhibit 187 have been obtained from the books and records of the two companies and have been combined with proper eliminations of inter-company transactions by a member of my staff. The gross earnings from operations shown on line 1 for the 8 months ending August 31, 1939, are somewhat in excess of $1,000,000 more than the gross earnings from operations for the 8 months ended August 31, 1938.

The net earnings from operations for the two periods show an increase of $802,518.70. The net earnings available for dividends for the two periods show an increase of $1,228,984.42.

The operating expenses which are used to determine the net earnings from operations by deduction from gross earnings from operations and shown on line 2, are per the books and records of the company.

My examination reveals that during this period the amount of expense which the company has set up for regulatory commission expense is probably subject to future charges as the amount of that expense does not appear to contain all of the bills for regulatory commission expense which the company has incurred during the 8 months. However, the increase of $201,000 in expenses can be summarized as arising to the extent of approximately $175,000 due to the increased cost of gas purchased. Pipeline expense, compressor station expense, telephone expense, and other production expenses, as well as new business expense, are substantially offsetting. General and miscellaneous expense has increased approximately $150,000. The gas used by the company has increased approximately $45,000 and that expense is an offset item. In other words, an increase in the gas used by the company results in a decrease in the total expenses of the company.

The increase of general and miscellaneous expense is accounted for to the extent of $100,000 by an increase in income tax on the increased earnings, approximately $27,000 increase in other taxes, and approximately $12,000 increase in legal expenses. The regulatory commission expense on which I have just commented, has decreased by $59,000 and a new expense, the employees' retirement plan expense, amounting to $59,532.40, appears in the 1939 accounts without any item for that expense in the 1938 accounts.

During the first 8 months of 1938 the Natural Gas Pipeline Company of America paid dividends amounting to $1,687,000. During the first 8 months of 1939 the dividends amounted to $1,500,000. That is the way those dividends
1522 were declared. I think the rest of the exhibit speaks for itself.

(EXHIBIT 187 was offered and received in evidence without objection.)

A risk in business arises out of a decision which must be made by a management and which, when made, will affect the subsequent profits realized by the business.

In a discussion of risks in business it is necessary, in my opinion, to distinguish between the continuous actions of conditions surrounding an industry and the continuous risking of money by the companies in the industry. The first set of factors, in general, determines whether the industry will be profitable as a whole. The second set of factors determines the relative prosperity of the companies within an industry. The risks arising out of the continuing commitment of money in a business are much more important than the risks arising out of the conditions surrounding an industry. The latter are slower and can be met over a period of years. The former are immediate and cannot be escaped. They can only be turned into a profit or loss. The risks surrounding an industry slowly affect the profitableness of the investment in the fixed assets, that is the plant, the business itself; the other factors affect the profit and loss for a given period, and its cash and credit standing.

One of the continuing risks that faces industries other than the utility industry is the conversion of cash into inventory. The size of inventories varies with the industry and with the company, but, in general, constitutes a major portion of the invested capital of an industrial company. Furthermore, in most industries this sum is risked several times during the same year—so-called turnover of capital. Beginning with the pre-season planning, industry is compelled to make provisions for a supply of the raw materials and piece parts which go into its manufacture, or of merchandise to be sold. Whether the management decides to contract in advance at a fixed price or to pay the current market price prevailing when the materials are required, there is no way of escaping the inventory problem.

The fluctuations in the price of materials which a concern consumes or sells will go on from day to day. If a business man contracts today to sell at a fixed price, he must decide whether he will buy his raw materials at today's prices or at some future price. Whether he chooses the one or the other, he has assumed a business risk which will inevitably be a major factor in determining the size of the profit or loss his year's business will produce. If, as some businessmen do, the risk is shifted to the purchaser of the goods or the vendor of the raw and semi-finished materials, profits are drastically curtailed, but, of course, so are losses.

From the point of view of the investor the mere showing of handsome profits in one year by a company cannot be taken as a measure of the desirability of investment. A manufacturer might finish the year with a very handsome profit arrived at entirely through advance in price of one of the raw materials which he uses and of which he had a large stock or contract, and all of his sales may have been made at an actual operating loss if the price level of materials used is considered.

1523 This type of profit cannot be relied on and is, of course, hazardous in the extreme. A year such as 1937 found financial writers emphasizing this type of risk. Prices of raw material and indexes of production had been rising quite steadily over a period. But the end of summer in 1937 found most industries with well-stocked shelves at what proved later to be high prices. The manufacturer who during the first seven or eight months of the year had been manufacturing for sale and not for stock and had stored up no supplies of raw materials could show a much more substantial profit, all other conditions being equal, than one who manufactured for stock or had contracts outstanding for his raw materials.

However, during 1936 the opposite condition had in general been true and the man who had contracted in advance for stocks of raw and semi-finished materials showed a larger profit than did the man who merely manufactured or purchased for sale. Every accountant knows the importance of this risk—he must carefully examine the inventory pricing. The almost universal valuation of inventories at cost or market, whichever is lower, for reporting to stockholders and for income tax purposes, without the valuation at market if market is higher than cost, is indicative of the importance of the risk.

Only public utilities and those few manufacturers whose raw materials and products are so specialized that there is no competitive market, escape this risk. The two companies we are considering have a very small percentage of capital in inventories, and the fluctuation in price is too small not to permit the recoupment of full cost through operations.

Another type of risk arises out of the labor situation. Whenever a manufacturer contracts to deliver his products at some future date at today's prices he must face the risk inherent in the labor situation. It must be kept in mind that in manufacturing industries the element of wages is a much more important part of sales value than it is in the utility industry and particularly in a case of the two companies. The census of manufacturers, for example, shows for 1937 that 1/6 of the value of products of all industries is accounted for by wages, whereas in the Natural Gas Pipeline Company and Texoma the wages paid are a substantially smaller proportion of the sales value of the gas.

Further, their workmen are not collected in one location, a condition which removes to a very great extent the risk of strikes and other labor disturbances. The principal substitute of gas, coal, is an example of the labor risk; natural gas has no substantial risk in this respect.

Another type of risk arises out of the overhead expense connected with business, that is, the expenses of operations other than productive wages and consumed materials. To a certain extent these expenses go on even if a factory is shut down completely; to a greater extent these expenses accumulate if the business is operating but at an unprofitable capacity. In the first place, the cubic foot sales of the Pipeline Company do not measure its revenue.

Even if the Pipeline Company sold not one cubic foot of gas, it would collect a demand charge from its principal customer, Chicago District Pipeline Company, sufficient to pay all of its expenses, including its present interest. Any business that has its complete overhead paid for

regardless of business conditions need not worry
1524 about risk. This one factor removes the Pipeline Company from the plane of ordinary industry into that of a guaranteed industry.

Another risk from which Natural Gas Pipeline Company escapes is the credit risk. It is true that many manufacturers take out credit insurance in order to escape this risk, but general industry will not pay prices which will support such insurance. It requires too much carrying charge per dollar of sales to make it economically feasible.

Natural Gas Pipeline Company has very few customers and its one large customer that takes 90% of its sales has not only its own credit standing to rely on but its payments are guaranteed by three Chicago area utilities, which guaranty would satisfy any credit man. Utilities have a very small credit risk, compared to industry in general, the two companies have substantially none.

Another type of risk which the Pipeline Company does not face arises out of competition between rival concerns for the same market with the same product. It is true that natural gas has competition with coal and oil, although it should be borne in mind that natural gas is the new competitor threatening coal and oil and not the old line established concern being threatened by a new substitute product, and that the competition is practically limited to sales to industrial concerns, not the highly profitable sales to the Chicago area utilities for resale to residential and commercial customers.

The type of competition which natural gas is called upon to meet, in general is slow in its effect on the companies' profits and small in amount. It is entirely different from the competition between rival concerns for the same market with the same product, as, for example, the rivalry between Ford, Chevrolet and Plymouth for the Chicago market for low priced automobiles, which rivalry is immediate and violent in its effects. Were one of these three manufacturers to fall behind in public favor, the result reflected in the profit and loss account for that year would be noteworthy.

This type of competition causes heavy expense for advertising and selling, an outlay which can only be recouped if the product meets with public favor. This form of competition hinges around price for quality comparisons, the development of styles and the introduction of minor changes. A price for quality competition arises out of many varieties of the same product graded in price and in quality, so that the customer can decide his own price level and then shop for the best buy at that level. This type of competition necessarily means low profits.

The development of new styles introduces a risk which falls unevenly among competitors, permitting one to make substantial amounts of money and causing another to lose substantial amounts of money. The development of minor changes especially if covered by patents, might lose a market for a manufacturer or gain it.

It is often necessary for manufacturers to buy up or obtain rights to minor changes which are covered by patents, even though they doubt the usefulness or desirability, because they must have control over its use if it meets with public favor. The two companies have no competition from a better gas or a cheaper gas produced by a rival natural gas company.

1525 Still another type of risk arises out of varying demands for a product. This type of risk must not be confused with the demand for a particular manufacturer's product which I just discussed. In general, the risk of varying demand for a general product cannot be overcome by any manufacturer. For example, when the demand for steel falls off a manufacturer may obtain increased sales at the expense of his competitors, but he, nevertheless, has been facing the risk inherent in change in demand. The experience of the Natural Gas Company has shown the pressure of this type of risk, but it takes a microscopic examination to find its effect in the profit and loss account. Its sales to industry during 1938 fell off substantially from the peak in 1937, but the effect on profits was hardly noticeable and could be determined only with a very detailed study.

The effects of change in demand for industries other than the utility industry are much more violent and are promptly reflected in the profit and loss account for the year, and even in the stock market. The last decline in demand was sufficiently noteworthy and widespread to be known to everyone by name—the recession. Right today if the war were to stop immediately or were not to lead to the sales industry expects, I think we will find a new name for its effects. That risk, an example of risk in change of demand, is today of vital importance to industry.

If all goes as industry expects, certain companies, not all, may realize substantial profits. But if it does not, I am of the opinion that the effect on industry, barring public utilities, and barring a few other lines of business, will be staggering. Its adverse effect on the two companies will not be noteworthy.

I examined the direct testimony of the witnesses Floyd C. Brown, Delafield, Dorau, Gilman and Emery dealing with the subject of risk.

The type of risk which arises out of technological changes has several aspects. In most lines of industry there is a need for expending substantial sums of money in research on the products to be sold. In our case, the product, natural gas, needs no such research expense and its sales cannot be affected by the research expense of any competitor which results in an improvement in the quality of its gas.

It is true that change in utilization appliances may put coal or oil in an improved competitive position (all industry finds itself faced with that type of risk), but the effect would be slow to appear and small in amount. The effect of changes in a product, in this case, natural gas, due to research within an industry, acts more rapidly and with greater intensity than does the effect of changes due to research which bring forward a substitute product.

Another type of technological change is brought about by research in manufacturing methods and devices. Here, again, no technological change in the drilling of wells or in the building of pipe lines can have a substantial effect on the business done by Natural Gas Pipeline Company. Its pipe line is built and is estimated by the company to be useful only until 1954. Until that date this pipe line is the best and it is inconceivable that another pipe line could be built to take its place. This is not true in industry in general.

1526 A steel mill might be the last word today, but if a competitor obtains either a price or a quality advantage due to a new type of mill, the older type must be replaced or content itself with substantially reduced profits.

In many lines of industry the manufacturer makes no attempt to control his ultimate market. For that reason I fail to see very much point in the testimony of experts for the company that Natural Gas Pipeline Company has a risk which should be given consideration in the rate of return due to the fact that it does not control the market. Most manufacturers prefer to be relieved of the risk of selling and credits in return for relinquishing a margin of profit. The entire jobbing industry is indicative of this fact.

Sales agencies, such as the motor industry has established, are another example. Retail selling is divorced from manufacture more than the retail distribution of gas is divorced from production and transmission in our case. Furthermore, it must be kept in mind that to a substantial extent the Pipeline Company does control the entire Chicago area market much more than does any manufacturer and at no cost to itself.

In the first place, the Chicago area utilities have guaranteed a demand charge payable by Chicago District Pipeline Company to Natural Gas Pipeline Company which, once paid, makes it impossible for them to obtain their requirement of high B.t.u. gas from any other source in large amounts economically. In the second place, they made an investment of approximately $5,600,000 in addition to their investment in the Natural Gas Pipeline Company and Texoma.

These Chicago area utilities incur the selling expense which is substantial. I am well acquainted with the operations of all three and it is to the interest of these Chicago area utilities to sell all the gas they can. It must be remembered that at the present time the only gas that they can sell to the consumer is either natural gas or mixed gas containing a very high percentage of natural gas.

Questions by the Examiner.

You ask what is the percentage of natural gas in the mixed gas sold by the Chicago utilities. This mixed gas is an 800 B.t.u. gas. I think the artificial gas formerly sold was 530 or 565 in Chicago. The cost of the natural gas is more than half the cost of the total gas which is mixed. The $5,600,000 investment to which I referred, consists of a $3,000,000 investment in the Chicago District Pipeline Company, and approximately $1,662,000 investment by

The Peoples Gas Light & Coke Company in the conversion of its own system to take care of this high-powered gas, and approximately $800,000 expended by the Public Service for the conversion of its distribution system, and approximately $150,000 expended by Western United Gas and Electric Company for the conversion of its distribution system. The total of those is somewhat in excess of $5,600,000. I have not included in my computation the other expenses which were expended by the three Chicago area companies for such things as house heating equipment, and special expenditures of that type which they are amortizing over a period of years because it is rather difficult to find out what the total is, and $5,600,000, I think, is enough to show that these companies have a very substantial interest in seeing that they obtain a supply of the high B.t.u. content natural gas.

1527 *Direct Examination by Mr. Booth Resumed.*

These Chicago utilities do a reasonably good job of selling their commodity. The Peoples Gas Light & Coke Company, the largest of the three, recently won a national contest among gas companies for the effectiveness of its advertising. It receives favorable notices as often as any other gas company does, commenting on its selling activities.

The record of FHA houses in the Chicago area shows that in general the range and the refrigerator is a gas utilizing installation in about the proportions that are to be expected. In my opinion it would require substantial factual proof, and it cannot be based on an assumption, for anyone to predicate risk on the theory that Natural Gas Pipeline Company could sell more gas in the Chicago area market if it were allowed to control such market directly, instead of indirectly by its arrangement with the three Chicago area utilities.

Cross-Examination Interposed by Mr. Slaff.

You ask if I know anything about how the moving picture production industry fared in its attempt to control the retail market for its product. They are up before the Federal Trade Commission right now. As a matter of fact, I think an attempt to control the market by an industry or by an individual company leads to trouble with the Federal Trade Commission or with other regulatory bodies. The only way to control a market which is legitimate is to sell the best product at the lowest price.

Direct Examination by Mr. Booth Resumed.

I have studied the exhibits and testimony presented on behalf of defendants dealing with their future operating results and future investment in plant. I have put the results of my study in the form of an exhibit entitled "Proforma Comparative Balance Sheets Annually at December 31, From 1939 to 1954 and After Liquidation."

(At this point counsel for complainant requested that the exhibit just referred to by the witness be marked for identification. At the direction of the Examiner the document was marked Exhibit 188.)

In studying the exhibits dealing with future investment and future earnings presented by the company in this case, I found it desirable to put down on paper, as an accountant or even a bookkeeper would, what these things really mean. The exhibits I will refer to, used in compiling my exhibit, were Exhibits 116, 117, 137 and 141. I will refer to those as I go along. We find that in 1939, in accordance with line 14 on page 2 of Exhibit 141, the company will spend $106,530 as a capital expenditure for replacements. Now, bookkeeping-wise, to an accountant, that means that cash will be reduced by $106,530, and that the property will be increased by $106,530. In the next line we have the cost of retiring capital replaced, $8,692. To an accountant that means that $8,692 of cash is to be expended, and the cash will be reduced by that amount, and that will be charged against the reserve for depreciation and depletion.

The next line shows salvage value of retirements, $50,832. That means that out of the property that has been replaced the company will get, either in cash or in materials, $50,832 which will be credited to the depreciation and depletion reserve.

1528 I have set down in my exhibit the information contained in Exhibits 116, 117, 137 and 141, in the way that they would affect the accounts year by year, in order to get the picture as to what would the balance sheet of these companies be at the end of each year, and what would it be after liquidation.

No, my exhibit does not show the earnings. It shows the balance sheet, what is the position of this company at the end of each year, what are its assets, what are its liabilities, and how much are each of them.

A proforma balance sheet is an accounting device that is very widely used. Whenever it is desirable to see the effect of certain future transactions on a company, they put them down in exactly the same way as they would be recorded when they actually do occur. Of course, you assume that your information is correct and from that information you build up the balance sheet in exactly the same way as if you were recording actual transactions. Because they are not actual, they are called proforma. I accepted the figures set forth in the four exhibits and am using them to see what the balance sheet would be on the basis of these four exhibits at the end of each year and after liquidation. I have said that my proforma sheet is a balance sheet based on certain assumptions. In this case it is based upon the four exhibits.

This exhibit which I have prepared is all-inclusive. In other words, it is all of the working papers that there are. It shows exactly how I built up this exhibit. You can turn to any page after page 4 and you will find listed there two types of items at the bottom of the sheet, the source, by which I mean something which the company has in the record, and the data, by which I mean something I have compiled and the source of which I show exactly.

My summary sheets are sheets 2, 3, 4, and 5, which are Schedules 1, 2, 3, 4. I think that for the purpose of explaining the exhibit that I would like to point out one of the supporting sheets; for example, take Schedule 5 which is shown on sheet 6.

Now, here on this schedule in column "(b)", I give the cost of additional property, and you will see from "Source" that it comes from Exhibit 141, page 2, line 22. The way the exhibit was prepared was finding the cost of additional property in a company exhibit, we took that and listed it down year by year. Next to it, in column "(c)", we put capital expenditures for replacements, which comes from Exhibit 141, page 2, line 14. Next in column "(d)", we have the total additional capital investment which, while it is the total of columns "(b)" and "(c)", can also be obtained from Exhibit 117, page 1, line 3, direct from the company, so that I took the precaution to see that these four exhibits that I am using seemed to be made up on one and the same basis and that it is proper to use the four of them at one time.

Now, in column "(e)" we have the book cost of property retired, and that comes from Exhibit 117, page 1, line 6. The difference between column "(d)" and column "e)" is the net change for each year in the capital assets, and by adding or deducting the net change to the balance at the end of the previous year, you get the balance at the end of the year as shown by footnote "B."

1529 The figure at the bottom of column "(g)", $69,179,314, is the balance which will be in the capital accounts of the two companies as of December 31, 1954, at which time these two companies will be ready for liquidation. That figure is based upon exhibits presented by the company and admitted into evidence as Exhibits 116, 117, 137, and 141.

While, in general, I found all of the information which was needed to compile this exhibit, I did find it necessary to make certain assumptions. Page 1 shows the four most important assumptions. The first assumption was as to dividends. The company had made no estimate as to what future dividends were to be. The dividends which I have allowed for the purposes of this statement are cash dividends to be paid each year, 25 per cent of the stated value of the capital stock of Natural Gas Pipeline Company of America, outstanding January 1, 1939.

No dividends are to be paid on the capital stock of Texoma Natural Gas Company until liquidation.

The next assumption I made dealt with other net current assets. This caption reflects, as you will find from the sheet bearing that title, quite a number of accounts, but the ones that we are principally interested in were the changes in taxes accrued resulting from the payment of Federal and State income tax in the year following accrual because they vary in substantial amounts, and changes in interest payable, based on the assumption of borrowings and repayments. Changes in current assets other than cash and changes in current liabilities other than taxes accrued and interest payable, have been assumed to be offsetting.

I think that assumption is a proper one to make because in all events the principal item of your current assets will be the accounts receivable of these companies from the Chicago District Pipeline Company, and that amount remains substantially the same according to the earnings statement submitted in Exhibit 141, and at all times the company will have a sufficient amount of cash, in accordance with the other assumptions that I have made, to pay all of their bills at the end of the year or as they become due.

The third assumption I made was in reference to the item of salvage. I assumed this item to represent either cash value realized, or materials reused during the year for which the salvage was estimated. There may be some slight delay, but the amount involved is so small that if I am in error in that assumption, the net effect on the exhibit as a whole will be negligible.

The fourth major assumption that I made was with respect to borrowings in those cases where I found it would be necessary for the company to borrow money. I assume that the borrowings would be made 15 days in advance of the date on which the company is obligated to make its sinking fund payments to retire bonds. The interest is assumed to be six per cent. So that, in effect, the bonds due to be retired under the provisions of the company's mortgage will be extended by the holders thereof for the additional period required until there is sufficient cash in the company to pay the amount up.

Interest on borrowings are assumed to be payable
1530 every six months and repayments of borrowings are
assumed to be made on a semi-annual date at which the recurring six months' interest becomes due. In my opinion those assumptions are sufficiently liberal that I think they cannot be criticised.

Based on the four exhibits reflecting the information necessary to arrive at balance sheets at the end of the year with the assumptions which I have just referred to, I find that the balance sheet at the end of each year would be as shown on sheet 2, with amortization of capital assets on an arbitrary straight-line basis. The accounts which I show are in column "(b)", the capital assets, and column "(c)", the cash.

In column "(d)" are other net current assets; column "(e)", bond discount, with the total assets shown in "(f)"; column "(g)" shows debt obligations; column "(h)" is reserves for amortization of capital assets; column "(i)" is the capital stock; column "(j)" is surplus, and "(k)" is total liabilities and net worth. Columns "(k)" and "(f)" are the same, as they must be.

In lines 1 to 16 we have the balance sheet for the date

December 31, years as noted. Line 17 is the balance sheet after liquidation. That is based upon the assumption which the company has made in this case, namely, that it would be compelled to go out of business at the end of 1954 due to the exhaustion of the supply of natural gas in the Panhandle field. The figure $47,537,862 shown in column "(c)" under the caption "Cash," line 17, is the cash that will be on hand after these properties have been liquidated to pay off the previously unpaid investors and consists of capital stock, $3,500,000.

That means that the company would have $47,537,862 in cash, and retirement of the bonds which are now outstanding or the retirement of such indebtedness, other than the capital stock, as the company might incur between now and the end of 1954, and the payment of 25 per cent cash dividends each year on the capital stock of Natural Gas Pipeline Company of America. In other words, I have assumed that the company would pay an average annual cash dividend of 25 per cent on the $3,000,000 common stock of Natural Gas Pipeline Company of America during each of the years 1939 to 1954, and have arrived at the conclusion on the basis of the company's own exhibits introduced in this case, that the company would have remaining $47,537,862 after the retirement of the company's bonded indebtedness.

That figure is also based upon the assumption that there be no rate reduction during that period. Of the $47,537,862 remaining, only $46,250,230 will be available on January 1, 1955. I presume that it will take some time to liquidate the company. The balance comes in after the disposition of the pipe line.

Page 3, as its heading indicates, is the same as page 2, that is, it is a comparative balance sheet at the end of each year and after liquidation, excepting that the reserve for amortization of capital assets is built up on an arbitrary sinking fund basis instead of on an arbitrary straight-line basis.

I would like to point out that the only difference between the two is the amount at the end of any one year which is in surplus, and the amount which is in reserve at the same time. The total of surplus and reserve is always the
1531 same because that is the total of the profits remaining
for depreciation, depletion, amortization of capital assets, and return, so that it doesn't make any difference which way you set up your amortization of capital assets,

or which way you depreciate and deplete, excepting as to the intervening surplus accounts.

The amount of cash at the end of each year is exactly the same. The amount of capital assets is exactly the same, the net current assets are exactly the same. Everything else remains exactly the same. Because this company is allowed to recover the value of its capital assets, which it will lose during its operation, at some time during the whole period, each person might have his own idea as to how much should go in in any one year. If he puts in more there is less left for surplus available for dividends. If he puts in less, there is more left for surplus and dividends, but over the whole period he can only get $69,105,182, which is a loss on the capital assets.

Cross-Examination Interposed by Mr. Morgan.

I get the figure $14,867,000-odd from Schedule 10-B. I start the amortization in 1939, but of course I bring forward the balance on the books of the company as shown in Exhibit 137, page 1, line 36, column 8. I haven't gone back of regulation or anything else. I have taken the balance sheet as shown in Exhibit 137. I have applied to it the information shown in the other exhibits which I have mentioned, and the results are these balance sheets which we have here.

The rate of interest I have used on my sinking fund is 6 per cent, as you can see from Schedule 14, on page 23. You see the only difference it would make if you take any other sinking fund interest, is that you would allocate more to the payment and less to the interest, and the only difference between straight-line basis and sinking fund basis is how much do you take in in each year. Some time or other out of the earnings of the company it is necessary to set aside a reserve sufficient to take care of the loss on its capital assets.

How that is set aside is only of interest if we are looking at this year's situation. If all we had before us were today's value of this property, no estimate as to what will happen in the future, and today's earnings, say, for two years past, and possibly an estimate for next year, and it is necessary for the Commission then to set a rate of depreciation or a method of depreciation, it becomes of vital importance as to how much is set aside for that particular factor. But, when we are dealing as I am with the entire future life, all I have to be interested in is that some time or other, during this company's history, it will get back all of its loss due to its investment in capital assets ultimately being of no value.

When I speak of the entire future life of the company, I am taking it as per the four exhibits. The 6 per cent interest comes from the company. Of course there isn't any sinking fund in sinking fund amortization. Sinking fund amortization is an accountant's method of computing amortization, but there is no sinking fund in it then. When the California Commission talked of sinking fund depreciation, they were not talking of any sinking fund being set aside; that is merely a method of getting at it. There is no sinking fund. It is merely as if there were a sinking fund. So far as the earnings coming from the outside, I am sorry to talk like this but it really did amuse me, because that just doesn't happen. There is no such thing.

1532 *Direct Examination by Mr. Booth Resumed.*

In the summary sheets 2 and 3, I show that the company will have $47,537,862 left to liquidate the common stock after the redemption of the company's bonds, debt obligations, and the payment of the 25 per cent cash dividend annually from 1939 to 1954, whether or not the amortization of the assets is being taken on a sinking fund or straight-line basis.

As to summary sheets 4 and 5, you ask if I assumed a rate reduction of $3,000,000 and demonstrate that also based upon those same company exhibits that the company would have $3,930,923 in cash to liquidate the same amount of capital stock after redemption of all the debt obligations and the payment of 25 per cent common stock dividend annually for each of the years 1939 to 1954, inclusive. That is correct except when you say that I assumed the rate reduction of $3,000,000 a year. I calculated the rate reduction which would leave the company with enough to pay off all of its investment and the dividends which I have stated and the odd money which in this case is $430,923.

That calculation shows that a reduction of $3,000,000 a year effective January 1, 1940, can be made and still leave the company with enough money to pay all its interest, pay out to all of its investors 25 per cent on the common stock of Natural Gas Pipeline Company, and $430,923 is the final liquidating bonus on $3,500,000 of stock.

Questions by the Examiner.

My calculations were made at a place indicated by these footnotes at the base of the column, and I think you will find as you follow those footnotes through, that I have included in the balance of my exhibit, that is from Schedule 5 on, everything. My desire was here to put in the complete story. The figures in line 17 that have been changed are $3,930,923 in column "(c)", $3,930,923 in column "(f)", $3,500,000 in column "(i)", $430,923 in column "(j)", and $3,930,923 in column "(k)".

Sheets 4 and 5 are the summary sheets where I made the calculations based on a $3,000,000 rate reduction effective January 1, 1940. Page 5 is the same as page 4. You ask if the corrections are the same. They are not corrections. They simply did not show up either in the girl's typing or in the dittoing, but it is merely again to illustrate the difference between the sinking fund basis and the straight-line basis because for this purpose it makes no difference which you use, or how much you use. Over the entire period they are entitled to recover a certain sum of money.

Direct Examination by Mr. Booth Resumed.

I don't think there are any working papers; but all of my working papers on this matter will be available to the company, their counsel and experts.

Based upon the study I have made of defendants' operations, upon my familiarity and knowledge of the money markets, upon the many years of study and analysis that I have given to business conditions, upon the experience I gained in handling the financing of utility corporations as Chief of the Illinois Commerce Commission's Accounts and Finance Department, I have given consideration to a rate of return which in my judgment should be reasonably sufficient to assure confidence in the financial soundness of the two companies and which would be adequate under
1533 efficient and economical management to maintain and support its credit and enable it to raise money necessary for the discharge of its contractual and public duties. In my opinion a fair rate of return which meets these tests is 6 per cent.

(At this point EXHIBIT 188 was offered and received in evidence without objection.)

Questions by the Examiner.

The list I gave of the cases in which I have testified is not complete or full, but they have all been before the Illinois Commerce Commission; and a great many of the cases are small and my testimony was minor. The important cases are listed.

(At this point counsel for the Federal Power Commission offered in evidence Article 4 of the Indenture between Texoma Natural Gas Company and The Chase National Bank of the City of New York, and Articles 4 and 5 of the Indenture between Natural Gas Pipeline Company of America and The Chase National Bank of the City of New York, and asked the privilege of withdrawing the originals, and substituting photostatic copies thereof. Counsel for defendants offered the remainder of each of the two indentures referred to in the event the articles offered were received in evidence. The Examiner announced that he would withhold his ruling until the next session of the hearing.

Mr. Booth: If the Examiner please, I now desire to present to the Examiner and to the Federal Power Commission a motion for an immediate order requesting the Federal Power Commission to reduce the rates charged by the Natural Gas Pipeline Company of America. This motion is a motion presented on behalf of the Illinois Commerce Commission by John E. Cassidy, Attorney General of the State, by myself as Assistant Attorney General, for the Illinois Commerce Commission, and it is joined in by Mr. George Slaff, and D. A. Myse, who are of counsel in this case, for the Federal Power Commission.

This motion is presented, I will say, after very serious consideration to the evidence that has been presented in this case on behalf of the company. It demonstrates that based upon the company's own evidence that the earnings of the Natural Gas Pipeline Company and the Texoma Company over and above either the investment or the original cost of the companies' property, after payment of all expenses, taxes, and providing for amortization, or based upon the companies' reduced costs evidenced that the earnings for this year and next year, 1941, vary from nearly $3,000,000 over and above either 6 or 6½ per cent return, upon either the investment or the reduction cost, to more than $4,000,000 over and above a 6 to 6½ per cent return upon those bases which I have suggested.

We recognize that if the Power Commission is to give consideration to the evidence that was submitted yesterday and today that the companies probably have a right to cross-examine the witnesses that were presented yesterday and today, but we believe that the case should be set down for cross-examination at the earliest possible time. The company may also present such evidence by redirect as a result of the cross-examination as conducted by the companies' witnesses on rate of return.

If the procedure is proper, I will hand to the Examiner now an original signed copy and 10 copies, and ask that they be received as part of the record in this case at this time.

I also hand to counsel for the company copies of the petition at this time.

Mr. Slaff: Mr. Examiner, as has been pointed out by Mr. Booth, I join in this motion and Mr. Myse, who is also of counsel for the Federal Power Commission, joins in this motion, and I want to add to what Mr. Booth has said, the suggestion that this motion be transmitted by the Examiner to the full Commission and that with the suggestion that argument of the motion be set down before the full Commission immediately upon completion of cross-examination of the witnesses on rate of return who have been presented by the Illinois Commission and the Federal Power Commission, and the completion of redirect testimony on the subject of rate of return by the companies.

This is, as you will observe, a motion for an immediate interim order, and the efficacy of such a motion, the efficacy of the rate regulatory process when such a motion is involved, depends upon expedition.

Mr. Morgan: Do I understand that counsel are resting their case?

Mr. Slaff: By no means.

Mr. Booth: No, we are asking, and we believe the Federal Power Commission has ample statutory authority to enter an interim order fixing fair and reasonable rates whenever it appears from the evidence in a case of this nature, as the evidence clearly discloses, that the rates of these companies are unjust, excessive and unreasonable, and contrary to the Natural Gas Act, under which the Power Commission is regulating these companies.

Mr. Slaff: May I add that such an excellent lawyer as Judge Morgan is thoroughly aware of what an interim order is in this proceeding and any other proceeding and counsel for the Federal Power Commission is by no means resting the case of the Federal Power Commission as it will be presented by counsel for the Federal Power Commission who have come to the conclusion that the Commission is now in a position to order a reduction in rates based upon the evidence which has already been presented, that the Commission has full power to do so, and that the Commission should do so, the presentation of cross-examination of other company witnesses will continue and the presentation of direct evidence by the Federal Power Commission will take place in due course.

The Trial Examiner: The motion will be received as a part of the record and will be given proper consideration by the Examiner..

Mr. Booth: I assume it will be transmitted immediately to the Commission.

The Trial Examiner: It will be given proper consideration, Mr. Booth.

Is there anything further at this time?

Mr. Slaff: Nothing except the setting of a place and date for the next hearing.

The Trial Examiner: Mr. Booth.

Mr. Booth: We have nothing else to offer at this time.

The Trial Examiner: Judge Morgan.

Mr. Morgan: Nothing else.

The Trial Examiner: There will be a five minutes recess.

Mr. Slaff: I take it the next hearing will be devoted to cross-examination of witnesses who have been presented by the Federal Power Commission and the Illinois Commission on the subject of rate of return and redirect testimony by the companies on the same subject.

Mr. Morgan: It depends on how long the hearing will last. We can say as to all of that if we know now how long it will last. It is going to take some time to cross-examine the witnesses.

The Trial Examiner: Yes, the hearing will be in recess for five minutes.

(Whereupon, a short recess was taken.)

After Recess.

The Trial Examiner: The hearing will be in order.

The first order of business at the next hearing session will be corrections.

In view of the motion that has been made, it behooves counsel to get the record completely cleared so that there will be no delay in forwarding the record along with the motion when the proper time comes.

Subject to the approval of the Commission, the Examiner sets for the date on which argument will be heard on the motion filed by counsel for the Illinois Commerce Commission and the Federal Power Commission for an immediate order reducing rates, Monday, December 11. The Commission may, of course, determine to hear argument itself. Counsel desiring to file briefs addressed to the motion will do so on or before Monday, December 11.

Mr. Morgan: Mr. Examiner, it will be absolutely impossible for us to write a brief between now and December 11 and do all that has been assigned to us with reference to cross and redirect examination of the witnesses who have already testified. It can't be done.

The Trial Examiner: If necessary the matter will be the subject of a motion at the conclusion of the next hearing session.

Mr. Morgan: I doubt if the next session will be over then.

The Trial Examiner: With respect to the next session, the Examiner sets as the date, Monday, November 27, and as the place, the Club Room on the Mezzanine Floor of the Sherman Hotel, Chicago, Illinois, and the hour 10:00 o'clock a. m.

Mr. Booth: I want to suggest right here that if the company asks for any more delay, and I think that they should be ready for cross-examination and redirect testimony on the 20th, that they file a stipulation with the Federal Power Commission to the effect that any order entered by the Federal Power Commission reducing the rates of their company be made retroactive if the order is sustained in the Courts.

Mr. Morgan: Mr. Examiner, is there going to be any requirement that we be furnished with briefs or the movants, or must be anticipate what they have to say in support of this motion?

Mr. Slaff: As far as the Federal Power Commission is concerned, or counsel to the Federal Power Commission in this case, the basis of the motion is set out in the motion papers. It is possible, I suppose, that the—I withdraw that.

Mr. Booth: Yes, the motion is in considerable detail.

The Trial Examiner: If there should be any question of setting a date for reply briefs, that will have to be considered.

Mr. Slaff: That, I presume, will be considered by the Examiner or by the Commission whichever hears the argument on the motion.

The Trial Examiner: After giving further consideration to the motion.

Mr. Booth: We will also consider the question.

The Trial Examiner: Now, with regard to setting the date for the 27th, the Examiner wishes to say that that was done after due deliberation and consultation with counsel.

Mr. Booth: I understand that counsel for the company have stated that they cannot be ready before that date and that that was the reason the date was fixed on the 27th.

Mr. Morgan: That is correct.

1534 (November 27, 1939.)

(Counsel for complainant produced a document described as a certified copy of Exhibit 156, which, he stated, was a copy of Exhibits 2 and 2-A in The Peoples Gas Light & Coke Company case, Docket No. 21170, taken before the Illinois Commerce Commission, and requested that it be substituted for the original document bearing that exhibit number. Exhibit 156 was received in evidence without objection in lieu of the previous document bearing that exhibit number.)

CHARLES W. KNAPP, a witness for the Federal Power Commission, recalled, testified:

Direct Examination by Mr. Slaff.

(At this point counsel for the Commission produced a document with the request that it be marked for identification. At the direction of the Examiner the document was marked Exhibit 191 for identification.)

Exhibit 191 is a revision of Chart No. 8 in my Exhibit 185. The revision in this chart was made by the United States Bureau of Labor Statistics, as announced in its August, 1939 issue of Employment and Payrolls, Serial No. R-1007.

It was explained that this revision referred to the figures from 1935. The data have been revised to conform with results obtained from a study of the 1937 census of manufacturers. The revisions affected only payrolls and employment as shown on Chart No. 8 of Exhibit 185, and the supporting schedules, which may be identified as Schedule No. 12, page 2, "Employment," and Schedule No. 12, page 3, "Payrolls." A comparison of this chart with the original chart contained in Exhibit 185 indicates that there has been no substantial change, except that the year 1938 shows a somewhat wider gap between employment and payrolls in the revised chart.

The changes, such as they are, in the figures can be seen by comparison of pages 2 and 3, Schedule 12, as contained in Exhibit 191, with pages 2 and 3 of Schedule 12 as contained originally in Exhibit 185. Of course, it should be pointed out that in Exhibit 191 the information contained in the chart and in the schedules has been brought up through September, 1939, whereas the previous chart and schedules carried through only the month of June, 1939.

Questions by the Examiner.

With regard to that exhibit, the corrections were made in a bulletin published August, 1939. It did not come to our attention until we were making a study in an attempt to bring some of these figures more nearly up to date, as we had been requested by counsel for the company. I discovered it after I testified before.

(EXHIBIT 191 was offered and received in evidence without objection.)

1535 (Counsel for the Commission handed the reporter a document and asked that it be marked Exhibit 192 for identification. At the direction of the Examiner the document was marked Exhibit 192.)

Direct Examination by Mr. Slaff Resumed.

Exhibit 192 is a revision of Chart No. 10 and supporting Schedule No. 14 of Exhibit No. 185, which was entitled "National Income Payments by Type of Payment." This revision was necessitated by reason of the fact that in attempting to bring these data up to date it was discovered that the United States Department of Commerce had made a complete revision of its estimates of national income payments for the period since 1929. It will be noted from Schedule No. 14 of Exhibit 192, in comparing that schedule with Schedule 14 of Exhibit No. 185, that, in general, the estimates of national income payments have been increased by amounts ranging from $300,000 to as much as $3,800,000,000 in various years. For example, in 1929, the original Schedule 14 showed total income payments for that year of $78,574,000,000. In Schedule 14 of Exhibit 192 the total income payments for 1929 are shown at $81,660,000,000. Those changes are brought about by adjustments affecting the types of payment designated as compensation of employees, entrepreneurial income and net rents and royalties, dividends and interest, social security benefits and direct and other relief.

In most instances the amounts shown for compensation of employees have been revised downward. However, for the year 1930 an increase of some $200,000,000 appears to be involved; for 1929 an increase of some $900,000,000 and in 1936 an increase of some $100,000,000.

The changes in entrepreneurial income and net rents and royalties are understood to have been brought about primarily by the inclusion of what is designated as business savings for agriculture in the total amount of income shown, business savings being the amount of income in excess of annual withdrawals. That change was with respect to agriculture but not with respect to any of the other types of income.

In the case of dividends and interest there have been upward revisions in every year varying from $200,000,000 in 1929 to as much as $700,000,000 in 1936.

It will also be noted that the last two columns of original Schedule 14 have been combined in Schedule 14 of Exhibit 192 and the increase in this type of payment in the new Schedule 14 is occasioned primarily by the inclusion of pensions by private corporations which had not been previously included in the estimates of national income payments.

(At this point Exhibit 192 was offered in evidence.)

Exhibit 192 is substituted for Chart No. 8 and Schedule No. 12. My explanation of that change is the discovery of the corrected figures, the same as in the case of Exhibit 191.

(EXHIBIT 192 was received in evidence without objection.

Counsel for the Commission then handed the reporter a document with the request that it be marked for identification. At the direction of the Examiner the document was marked Exhibit 193.)

1536 Exhibit No. 193 for identification consists of Chart No. 11 and supporting Schedule No. 15, which are being substituted for the same chart and schedule number of Exhibit No. 185.

At this point I should like to direct your attention to Chart No. 11 of Exhibit No. 185 and point to an error discovered in the curve for national income payments at the 1929 prices for the year 1932, to which the arrow points. It was subsequently discovered after previous testimony that the figure in Schedule No. 15, column (d), for 1932, should have been 81.0 instead of 93.8, and the new Chart 11 will indicate that had this correction been made there would have been a continuous decline in that curve from 1929 to 1933. The reason for the revision of Chart No. 11 was primarily to record the changes produced in the index of national income payments by reason of the changes already described in connection with Chart No. 10 and Schedule No. 14 of Exhibit 192. The revision of the Department of Commerce brought the figure of $78,574,000,000 in 1929, up to $81,660,000,000. For 1932, of course, the figure shown here in column (d) of Exhibit 193 is 77.7, which is in the vicinity of the 81.0 revision that we mentioned before but is not identical because of the difference in the actual basic figure.

(At this point EXHIBIT 193 was offered and received in evidence without objection.)

You ask if there are any changes to be noted with respect to any of the other schedules or charts in Exhibit 185 as the result of revisions or changes embodied in Exhibits 191, 192, and 193. The answer is, only with respect to changes in Exhibit No. 191 with respect to employment and payrolls. I haven't prepared a revised schedule in this instance, but by reference to Schedule No. 22 of Exhibit No. 185 it will be noted index figures are shown for factory employment and factory payrolls for the United States in the first column of index figures, and due to the revision of index figures from 1935 forward, the figure of 106.1 for 1936 on the factory employment becomes 107.4; the figure for 1937 becomes 117.8 instead of 114.8; and for 1938 the figure becomes 97.3 instead of 94.1. There was no change in the figure for the twelve months ended August 31, 1939. Under factory payrolls for the year 1936 the figure becomes 96.2 in place of 96.0; for 1937 it becomes 114.9 instead of 114.3; and for 1938 it becomes 87.3 instead of 86.9, with no change in the figure for the twelve months ended August 31, 1939.

That is another one of the indices I brought down to date. I can give you them for the twelve months ended September 30th, all three columns if you would like. Under United States factory employment for the twelve months ended September 30, 1939, 112.1; under State of Illinois, 88.8; under Chicago industrial area, 82.7. Under factory payrolls, United States, for the twelve months ended September 30, 1939, 97.0; under State of Illinois, 85.2; under Chicago industrial area, 74.6.

I have read over my testimony and have handed Mr. Slaff certain corrections which I made in my testimony. All of my indices have been brought down to date so far as I have been able to do so with these amendments, Exhibits 191, 192, and 193.

1537 I have brought the Labor Bureau index down to date. In every instance the figures shown in all the charts and schedules have been brought down to date as nearly as possible and in many instances, if current figures are desired, sometimes I have weekly figures.

Cross-Examination by Mr. Morgan.

The changes to which I have not called express attention, but which have been handed to Mr. Slaff, go to typographical errors and things of that sort and not to the substance of the testimony. I have found there were errors, typographical errors, or errors produced by misunderstanding of my language which would ordinarily arise from attempting to transcribe what you hear. Otherwise, I stand on my exhibit and my testimony as I offered it in Washington.

I obtained my degree from the University of Vermont in the year 1931. I became a certified public accountant in the State of New York in 1934. During the interim I was engaged in public accounting work solely. I was employed by two different accounting firms, giving my entire time to the matter of accounting. During that part of the year 1938 in which I stated I was engaged in private practice in and about New York, I engaged in the practice of public accounting. I was offering my services to the general public as auditor or accountant. I don't know that there is any difference between an auditor and an accountant in the accounting field. The two terms are often used interchangeably. The general understanding is that an accountant does not keep accounts but merely checks the accounts kept by others. Such procedure is practically synonymous with auditing those accounts. The accounting department in a business is the department that keeps the accounts.

I stated in my testimony that prior to joining Allen R. Smart & Company I was employed by the Federal Communications Commission as an accounting expert on its investigation of the American Telephone & Telegraph Company. That was not work on that report which was exhibited in the hearing room at Washington, known as the "Federal Communications Commission, Telephone Rate and Research Department, Telephone Investigation," having to do with the problem of rate of return. I had no part in the preparation of that report. The term "accounting expert" is the designation or classification under which I was employed by the Federal Communications Commission. I can't say whether that designation means an employee who hasn't qualified under the Civil Service. I had not taken my examination at the time as an accountant and had not qualified and received my appointment under the Civil Service. If I understand the question thoroughly, the appointment was approved by the Civil Service Commission. Of course, the appointment was not on the basis of competitive examining. I am not an expert on Civil Service law or procedure. I have told you that I was hired as an "accounting expert." That was my designation. What that implies ordinarily would be one who is versed and skilled in the subject of accounting.

While with the Federal Communications Commission I made a study of the principles and methods of consolidation employed by the Bell system in the preparation of its consolidated financial statements. I did not refer to the books of the companies. I was furnished with all of the accounting detail which was used by the company
1538 in the preparation of its consolidated financial
statements, and from that ascertained the principles and methods by which the consolidated statements were prepared. I mean the accounting principles and methods that they employed in that connection. Another part of my work consisted of preparation of reports based on accounting and research performed by others of the investments of the American Telephone and Telegraph Company and four of its associated telephone companies, those researches extending back to the origin of each of the companies.

Another task was in connection with the Western Electric Company, where, on the basis of accounting work and research on the part of the staff, I was engaged to prepare a report on the financial history of the Western Electric Company, extending back to its origin, and also during that investigation I assisted in the preparation of studies, economic studies of one sort or another, such as the scope of the Bell system in the telephone industry. That is one title. Banking relations of the Bell system; interlocking directorates—I forget the exact title of that. Various other studies. These latter studies were not primarily of an auditing or an accounting nature. They were somewhat on the order of statistics. Bearing in mind that the information had to be requested, it is appropriate to say that it was taken from the figures that were available to me and put in my possession. In other words, I had to form some knowledge of the subject, and on the basis of that make inquiry for the type of information I thought possibly might be available. I called for the figures and such explanation of them as I required.

In my service with Arthur Andersen & Company and Peat, Marwick, Mitchell & Company, I was performing the same general accounting duties as those I have already described in connection with Allen Smart & Company. I would say that with the Peat, Marwick, Mitchell firm I was, you might say, a beginner.

My present title with the Federal Power Commission is Principal Examiner of Accounts. I have had no other experience in the business or financial field than that I have described here in connection with my direct and cross-examination. I believe the record contains a full explanation of my experience.

I have never had any experience in the matter of issuing securities because I have never had occasion to perform that type of work for any private company. I have never had anything to do with the sale of securities nor with the conduct of negotiations for the sale of securities. I have never had anything to do with the purchase of securities or negotiations for the purchase of securities in the capacity of one conducting such negotiations.

I have made studies relating to or going to the relation between bond yields and equity yields in connection with my studies with the Federal Power Commission. I don't believe that the relationship between bond yields and equity yields is altogether completely covered in these exhibits. I have data on bond yields and data on preferred stock yields, but common stock or so-called equity yields, are not shown as such in this study.

There is nothing contained in this study as yet pertaining to the subject of common stock. Now, when I
1539 said "this study" I am referring to Exhibit 185. I
prepared that exhibit. I exercised my own judgment as to what was to go into it. You ask why I left out of the study anything at all concerning the yields and cost of financing from and through common stock. It was not so much that they were left out, as you phrased it. I felt that the subject of common stock would be adequately covered in so far as this case was concerned by Exhibit 186.

Exhibit 186 deals with common stocks of natural gas companies. I could not say that I did not think it was pertinent to go into common stocks except as to those natural gas companies, and that that was the reason why I did not go further with my Exhibit 185 and include studies of common stock. As a matter of fact, there is no information included in this report directly as to yield on preferred stocks, as based on market prices. We have no issues of preferred stocks showing cost to company and yield to purchasers. Except in so far as that gives you an indication of market prices; we have no data in here on yields on preferred stocks as such. Yes, of course, I think that yields on common stocks and the costs of financing through common stocks are just as pertinent as the costs and yields on preferred stocks and bonds. As a matter of fact, the record does contain information on yields on common stock and yields on preferred stock, although it happens that they were presented in the record by witnesses for the company.

You are aware, of course, that I have testified concerning certain studies we had made of testimony presented by company witnesses.

In the two exhibits here I undertook to cover the field of general financing, and Mr. Smith confined his studies to the subject of natural gas financing. In my study on general financing I confined it to bond yields and to certain preferred stock yields, and gave no information on common stock yields or the cost of financing through common stock. It is certainly my view that the yields on the 120 rated bonds charted in this Chart No. 1 of Exhibit 185, and based on Moody's thirty bonds of four different ratings, have something to do with arriving at a proper rate of return for natural gas companies. You ask me to explain why the yield on common stock of the same character of companies as those included in those Moody curves would not also have something to do with the proper rate of return to natural gas companies. In the first place, I still hold to my reply to your previous question that Chart No. 1 has something to do with the rate of return for a natural gas company. Of course, as has been testified and as presented in this exhibit as Chart No. 4, it is my feeling that Chart No. 4 is more specifically related to the discussion of rate of return for natural gas companies. Chart No. 4 would have more to do with it than Chart No. 1 because the former, as you will see by the title, is based on bonds of forty public utilities, according to ratings, and in examining bond yields, in a discussion of public utilities' rate of return, you would naturally be primarily interested in knowing the status of public utility securities. In the statement I just made I am assuming that a natural gas pipeline company, such as defendants, is a public utility.

No, I have not put in preferred stock yields and common stock yields based on market prices, as such, although, as I have mentioned, we have in here something that very closely resembles what such a study would indicate in the case of preferred stock. I made no attempt
1540 in here to show common stock yields, that is true. I have made since the time of my last testimony a study of yields on preferred stocks and common stocks, and it might be desirable to present them as testimony at this time. I haven't offered it yet. It was not prepared at the time I testified. This study might be considered as an extensive picture of the securities market with this one exception of common stocks. Now, with respect to common stocks, you are undoubtedly aware that the market for common stocks in the last several years has been practically non-existent, and it is my recollection that we made an attempt to compile new common stock issues, and my recollection is that we found no representative issues. Had we found them we would have inserted those in this study.

You ask why there have been comparatively few common stock issues in the last few years. Well, there has been little expansion, of course; and, further, investors have been primarily concerned in recent years with the safety and security of their investment, which would naturally lead them into bonds. I think it would be a fair statement for the last few years to say they have been running away from risk in the making of their investments. I recognize from my study of these statistics that it has been very difficult to raise money by the issuance and disposition of common stock. I do not think that will necessarily continue. There were some issues of equity securities just about the time war broke out, or slightly afterwards, because at that time the prices of common stocks increased in some cases substantially. If that condition should continue to hold, it might be reasonable to expect that companies will attempt to obtain funds through common stock financing.

I can't tell you, without having made the necessary search, which companies have issued common stock securities and offered them recently. I just mentioned that I had read this general comment. Not having studied it, I do not know whether there is any basis for that comment, but the comment appearing in a well-known business magazine, I suppose that it could be relied upon generally.

Questions by the Examiner.

Market yields on issues which were previously issued prior to the time when I was making my study of yields could be used as well as yields on new issues. I am not saying they could not be, but I was merely commenting on the fact that we had shown preferred stock issues and not yields on market prices; and I was commenting on the fact that in attempting to do the same thing for common, we were stopped by the lack of data. I am referring to new issues. The data on outstanding issues can be used.

Redirect Examination Interposed by Mr. Slaff.

It is a considerably more difficult task in that, when we are attempting to get bond yields, we have a fixed interest rate to which to relate market prices. With respect to preferred stock, we would have essentially the same thing as in the case of bonds, that is, the preferred rate. With respect to common stock, we would have to get our earnings for given periods from the published company records, and then relate those to market prices. The earnings, instead of being fixed as in the case of bonds where the interest is fixed, and preferred stocks where the dividends are fixed, would vary considerably from time to time.

Cross-Examination by Mr. Morgan Resumed.

I am not going to take the position that it is not highly important in arriving at a proper rate of return to know the cost of financing through common stock. I believe the record does contain evidence of common stock yields of certain gas companies and electric companies.
1541 Exhibit 185 is a type of exhibit that could be used in any proceeding similar to this one. I had that in

mind in preparing it. I think it is pertinent to the question of what is a reasonable and proper return for these two pipelines. We have here two kinds of information, financial information and economic information; and it certainly seems most important to anyone who is considering the subject of rate of return to know what the course of financial and economic conditions was, and, as such, it is to be used in forming a background on which some judgements concerning the subject of rate of return can be based. Largely, orientation is its purpose. It is to provide a background of information regarding general financial and economic conditions. I would have difficulty in relating the material contained in this exhibit to the specific situation of defendant in so far as the question of natural gas securities is concerned, because I have not covered that in Exhibit 185, it being understood, as I previously testified, that Exhibit 186 would cover that field. I think the two exhibits are definitely related, as an attempt to depict, first, general economic and financial conditions and, second, the financial status and outstanding securities and issuance of securities for natural gas companies. In other words, the two studies as a whole are related in that way, that you need both studies to get a rounded picture.

You ask me what Exhibit 186 discloses or shows that it would not show if I did not have Exhibit 185 in here at all. It is somewhat similar, as I gather the question's meaning. I would put it this way. That in attempting to consider what is a rate of return that is proper, your mental processes are apt to be somewhat similar to those which you would experience if you were attempting to arrange for, let us say, the flotation of an issue of securities, refunding or otherwise.

I have already testified that I have had no direct experience in connection with negotiations for the purchase and sale of securities. At the same time, I do have an opinion on some of the things that I would do if I were so engaged.

I would want to know what current financial conditions were, in general, for public utilities and for natural gas companies, and I would like to know something about economic conditions and I would like to know something about the securities of natural gas companies and issues of natural gas companies' securities over a period, and interest. All of those things I think, would enter into a determination of the rate of return, just the same as they would enter into any consideration of what should be done in connection with the arrangement for the issuance of securities.

I would not agree that this material could be used "merely" for orientation. I think it is a very important matter. I recognize that in arriving at a proper rate of return for these companies there is involved the return to the common stock as well as the bonds.

You ask me to tell the relationship between the material in Exhibit 185 and the proper rate of return for defendants. I have already stated, I believe, what this relationship is and how it is to be construed. I don't know how I can make myself any clearer on it. Bear in mind, of course, that I have not attempted to use Exhibit 186. I have not made a study of that exhibit. I did not prepare that exhibit and there may be a few things about that exhibit that I do not recall. But if it has in it what I think
it has, it has the information on common stock earn-
1542 ings—price, ratios, preferred stock yields and bond
yields of natural gas companies, which, taken in conjunction with the general economic and financial data contained in Exhibit 185, should afford a basis upon which it should be possible for the Commission to arrive at what it considers to be a fair rate of return.

That is as far as I can go in stating specifically what the relationship is. I have given you a general answer. I cannot give you details, because I am not as fully acquainted with Exhibit 186 as I should be in order to answer your question.

You ask whether I think that the yields on bonds and the cost of money raised through bonds of natural gas pipeline companies are just as usable without the bond yields of industry in general and business in general as the information concerning common stock of natural gas companies is usable in the absence of any information concerning the financing through common stocks of business in general. I think it is necessary to bear in mind, in answer to that question, that at least, so far as I am aware, there are no published statistics currently in use from which it is possible to derive common stock earnings—price, ratios, and preferred stock yields in the same manner as it is possible to determine or obtain yields on bonds. Now, in the absence of statistics covering a period of time, the only alternative would be a prohibitive one, and that would be to compile your own statistics.

You ask me if the bond yields shown in Exhibit 186 are more usable in arriving at a proper rate of return for defendants because of the yields shown in Exhibit 185. In answer to that question, it would appear to me from merely glancing at page 6 of Schedule No. 5 of Exhibit 186, that out of one billion dollars of natural gas companies' securities outstanding, comprising the group of companies which are listed, a mere 15 per cent is held by the public, which would appear to indicate that perhaps the study of natural gas company securities as such, would not be a sufficient basis alone upon which to determine a proper rate of return for a natural gas company. Therefore, the yields shown there must be related to the bond yields of the companies shown in Exhibit 185.

It would appear that bond yields of other companies such as are shown in Exhibit 185 are important in appraising the bond yields of natural gas companies when the latter are used in connection with a study looking to the proper rate of return for defendants. You ask if it is any less important that the yields on common stocks and the cost of financing through common stocks of the same companies whose bond yields are dealt with in Exhibit 185, be also available when we go to appraise the financing through the sale of common stock of natural gas companies. It would be necessary to bear in mind, I think, that when you say the same companies it is quite possible the common stocks of each of those companies is not held by the public, for one thing, but held by holding companies. As I stated there are no published figures concerning common stock and preferred stock yields similar to those for bond yields and it would require a compilation based on research to obtain such figures. Now, it can be done and in my opinion it would be possible to get compilations for earning—price ratios on common stocks for a month or two months or three months which would probably serve as a fair indication of what the market was for common stocks of electric utilities or public utilities in general, at least, during 1543 a fairly recent period. The period would not necessarily have to be contemporaneous with the period which the study of bond yields covered; it might be interesting and it might be helpful if it were developed in that manner. Of course, financial information on yields and such, the reason for giving that over a period of time, as I have previously stated, is to form a background of information. In stating that it might be interesting and it might be helpful, I do not mean to express doubt as to whether it would be of any value. It probably would be of value. I mean it might not be necessary to go back, say, to 1919 and construct a series of common stock earnings-price ratios in order to determine what might be a proper and fair rate of return today. It would be just as logical to go back to that point for yields on common stocks as on bonds, but I still don't feel that it would be essential.

Redirect Examination Interposed by Mr. Slaff.

I have already stated before that it was my opinion and belief that in many instances the common stocks of the companies represented here would not be held by the public. Whether I have the basis of that detailed information with me I can't say without making a search. I am primarily speaking of the present rather than the time covered by these Moody curves which I have brought in here. The Southwestern Bell, Illinois Bell, and Pacific Tel. and Tel. are among those whose bonds are listed in the list of ten Aaa bonds used by Moody. My recollection is that Pacific Tel. has some common stock outstanding in the public hands. The common stock of the other two companies, I am fairly positive, is held by the holding company.

Cross-Examination by Mr. Morgan Resumed.

Those may not necessarily be the bonds that go clear back to the year 1920. They are changed from time to time to reflect changes in outstanding securities. I would be inclined to think in the case of a telephone company you would always find some of those in the Aaa group that had stock in the hands of the public from which a similar curve and index could be worked out; and the same thing would apply to these companies all the way back. With respect to the utilities it is a little more doubtful, because my recollection is since 1919 quite a good number of public utility holding company systems have come into being. While the bonds or stocks may formerly have been held by the public, they may subsequently have been held by holding companies after the formation of the system. In the fairly recent past and today I recognize, as I have already stated, that there is a great deal more difficulty in financing through common stock than there is through bonds, particularly high-grade bonds.

You ask me whether the bonds outstanding in the natural gas business aggregate only approximately 20 per cent of the total capitalization. I attempted to see whether that relationship existed on page 6, Schedule 5, of Exhibit 186. It does not appear to do so. I have made no study of any compilations or composite balance sheets of the natural gas industry, so I don't think I could answer that question. It would appear that more than one-half of the total outstanding securities of natural gas companies is represented by common stock in the group of companies listed on page 6, Schedule 5, of Exhibit 186, previously mentioned. Whether that would be true for the industry is another thing, but at least it would be true of companies of some size; and it would have to be borne in mind that the figure would be only an average and that individual instances may vary widely from it. That would be the over-all percentage. The common stock would be over-all somewhat in excess of 50 per cent on that basis.

1544 Yes, I know that the prices of the bonds which determine the bond yields depend largely upon the earnings of the company and the property coverage. I don't know that I can quite follow you in the suggestion that with reference to any particular company, it might be able to get money for a certain small per cent of its total capitalization at a very low rate of interest and yet find a great deal of difficulty in financing its common stock. It would seem to me, if you could get a very low interest on the bonds, the assumption would be it would be possible to obtain the remaining capital by other means. I did not say anything about cost. It would depend, of course, on many things in a situation. It would presumably depend largely on the risk. I could not compute the cost of financing through common stock by reference to the cost of financing through bonds for a comparatively small percentage of the total investment value. (Objection of counsel for the two commissions to the scope of the cross-examination overruled.)

I have made a study of certain decisions of courts and commissions from which have been derived certain elements or principles which surround the problem of the rate of return. Now, you ask me to state what elements or factors I think are important to study and develop in connection with arriving at a proper rate of return for these companies. My answer to that would be the elements that I have derived would apply to these two companies or to any company wherever rate of return is being considered. These factors are ten in number and I will read them in that order.

1. A proper return or rate of return is a flexible concept, and not a static rule.

2. What return is proper necessitates the exercise of an enlightened judgment in each case.

3. Current conditions are controlling and general conditions affecting all business should be considered.

4. The return should be sufficient to assure confidence in the financial soundness of the utility to maintain its credit and to attract the required capital.

5. The propriety of the allowed return depends largely upon the circumstances, locality and risk of the utility enterprise.

6. The return should be equal to that generally being made at the same time and in the general region on investment in other enterprises which have corresponding risks.

7. The historical cost of money to the utility and the current cost of money should be considered.

8. A utility's corporate structure, financial history and past operations should be considered.

9. The return should accomplish, among other things, due recognition of efficiency, or lack of efficiency in management.

10. The future prospects of the utility, its taxes, its development, the potential stimulation from reduced rates, and the character of the service should be considered.

I agree that those ten elements are important. They are taken verbatim from the June 1st issue of the Federal
1545 Communications Commission, Telephone Rate and Research Department study entitled "Factors Underlying Rate of Return in Public Utility Regulation as Disclosed in Court and Commission Decisions," page BII.

I have stated that Chart No. 1, Exhibit 185, is the chart which is issued by Moody to show the particular curves portrayed for the four classes of bonds rated Aaa, Aa, A, and Baa. I have stated that those bonds are not the same from 1920 on through to the point in 1939 when the curves stop. The identity of the bonds on which the yield is computed is changed from time to time. The number of the bonds is not intentionally changed. There was a change, if my memory serves me correctly, in 1928, since which time 120 bonds were used rather than the 60 previously used, and 120 would be used today if the number of issues was available. If there were 30 bonds of each rating available for use, they would use 120, or 30 in each classification or rating. I stated at page 7856 of the record that there are not always 120 corporations in the list, and there are not that number of corporations at this time, principally because of the difficulty of finding industrial bonds of the higher ratings. This is because there would not be very many of these bonds in existence which meet the specifications for those ratings. Most of the bonds fail to classify as Aaa and Aa bonds. They do not reduce the number of bonds in other ratings when they reduce the number of the higher class bonds. There are not 30 Aaa or Aa bonds listed at the present time. It seems there are 28 A bonds listed. It is not until we get to the rating Baa that we find the full quota of 30 bonds.

I deem this Chart No. 1 as being pertinent to some of the elements going to arriving at a proper rate of return for defendants. I would think Chart No. 1 is pertinent to elements Nos. 1, 2, 3, 4, 5, 6, and 7 of the ten elements enumerated a little while ago. You could include No. 8 as well. Undoubtedly No. 9 has a connection. Of course, it is difficult to see on just what elements these bond yields do not have some bearing. If you would get behind the statistics and examine the companies, you probably would get some indication of whether the company was efficient or inefficient in management. I think that this chart decidedly reflects facts of value with reference to the accomplishing of due recognition of efficiency or lack of efficiency in management. I think if the companies concerned were investigated that you would find companies having the high rating bonds to be companies who had efficient management. I would say the exhibit shows that in the sense that it gives you a basis or a point of start or beginning in any search for such an indication. I wouldn't say just because a bond was not included in the list of bonds shown here that that would reflect any indication that the company whose bonds were not included was not efficient. You say Moody's listing. Well, that is 120 bonds. There are other bond issues which carry Moody's Aaa rating and which are not included here. I would say that some of these securities were issued by companies which have very good management. I have not, as a matter of fact, made any study of the application of this chart to that particular element, except just the general observation that it takes good management, efficient management, to obtain low rates in obtaining capital--any kind of capital.

You ask whether I think that a bond with proper earnings times interest coverage and proper property coverage might sell for a lower yield than that of another company which had less earnings and property coverage, even though the latter were the better managed of the two. That is a
1546 pretty difficult question to answer. Management may
reflect itself in various ways. It takes efficiency of management from a financial point of view to obtain a low rate on bonds. It may take efficiency of operations for a company to make enough money so that on a larger proportion of bonds its earnings coverage would be equivalent. I mean there are too many factors involved there to give a simple answer, I believe. I think a fair statement of my view is that good management leads to a lower capital cost or cost of raising capital. Following that up, on the average I would say that a well managed company ought to have a lower rate of return, because it can get its capital at a lower cost. You ask if I think that element No. 9, "the return should accomplish, among other things, due recognition of efficiency or lack of efficiency in management," is to be recognized by reducing the rate of return for well managed companies, or whether it means exactly the opposite of that. My answer to that would be that the public is entitled to efficiency in management, and that if management is inefficient, a company would be penalized. The investor is entitled to good management, if you mean by that, we will say, an investor in a company is entitled to have that company operated under efficient management.

I haven't said that because an investor is entitled to efficiency in management he should be penalized. You ask if I think an investor should be penalized, if he has good management, by being allowed a lower rate of return on his investment. (Objection by commission counsel to above testimony overruled.)

I did not first state, I don't believe, or at least I don't recall having stated that a company should have a lower rate of return because it obtained its money at a low cost. Nevertheless, I will say that the return should be sufficient—going back to element No. 4—to assure confidence in the financial soundness of the utility to maintain its credit and to attract the required capital. Now, by the term "to attract the required capital," there is necessarily involved the subject of cost as applied to that capital. And I have already stated that the public is entitled to efficiency in management, and that if a company was not efficient in management the result would be to penalize that company as against the company which had efficient management. I hope I have answered your question.

You ask what I mean by "the result would be to penalize that company" as against one efficiently managed. Assume that a company is so inefficiently managed that its operating expenses are excessive beyond reasonable limits. In that case a company should be entitled to reasonable operating expenses, and if its operating expenses were unreasonable, it would be penalized to the extent that such unreasonable operating expenses would not be allowed.

I certainly subscribe to element No. 9, that the return should accomplish due recognition of the efficiency or lack of efficiency in management. You ask if that means that if a company is so managed that it earns special compensation and reward for itself by reason of that special management, recognition should be given that circumstance through the allowance of an added return. I think I have said what I consider to be the meaning of No. 9.

Questions by the Examiner.

Due recognition of efficiency would not be a bonus in that sense of the word. Probably it is conceivable that there may be circumstances involved, what might be considered a revolutionary departure from existing practice, which might entitle a company to some additional reward; but I think also that that would imply in the very statement that the public is entitled to a high degree of efficiency.

1547 You call my attention to a footnote to element No. 9 reading "See Chapter 8," and point out that Chapter 8 begins on page 46 of this study which has been referred to as the source of element No. 9, and that in the third paragraph an underscoring reads: "Mr. Justice Brandies suggests that the reasonable rate to be prescribed by a commission may allow an efficiently managed utility much more." The section you have just read is subject to the same deficiency as we have been discussing before. It purports to compare something, but does not give the thing with which the comparison is being made; when it says "may allow an efficiently managed utility much more," the question is, much more than what? If an argument should be made later in this case that there should be an element added to a certain rate of return to recognize efficient management, and it should be contested, and the Examiner should be persuaded that it should be allowed, I do not think he could find any index in Exhibit 185 for the amount of allowance that should be made. I think it is a matter of judgment in the final analysis. I don't think you can put it down in so many figures or such and such a percentage.

Exhibit 185, as I have explained before, is a general study that could apply to any similar proceeding. Now, if there is something unusual, so unusual as to be revolutionary in the efficiency of management of these two companies under discussion, I have made no such study as would give any indication of that one way or the other. I believe that possibly by this time the record must contain some discussion of the subject of efficiency of management of these two companies; but so far as that factor was concerned, I don't think that it is something that you can give recognition to in such and such percentage or so many dollars. As I have said before, I believe it is a matter of judgment. Each individual case would have to be judged on its own merits.

Cross-Examination by Mr. Morgan (Resumed).

You ask whether, if all the other elements would check out about equal and I was considering element No. 9 in particular, I would agree that if a company is well managed and if it is earning more money as a result of its good management than would be the case if it were characterized by the ordinary or conventional type of management, that it would be entitled to a higher rate of return. (Objection by counsel for the two commissions overruled.)

I have already stated my belief that the public is enitled to good management, and to service by a well managed company. Now, in view of that, I don't see how I can make any statement as to the so-called ordinary or conventional type of management which would have any effect upon the rate of return of the well managed company. You ask me whether, while I have enumerated No. 9 here, I, as a matter of fact, do not give it any effect when I get down to the question of the actual rate of return that ought to be allowed. (Objections by counsel for the two commissions overruled.)

My answer is that I haven't got down to the actual rate of return that ought to be allowed in this case. You ask what I mean by element No. 9, which I have said ought to be considered in arriving at a rate of return. (Objection by commission counsel to above testimony overruled.)

My answer will be again that if a company is efficiently managed, as the public has a right and is entitled to expect, there should be no particular award for efficiency. If a company is not as efficiently managed as the public is entitled to expect, the company in its assumed excess of operating expenses would be penalized to the extent that those expenses were unreasonable.

1548 That is my conception of what is meant by giving due recognition to efficiency in management in fixing a rate of return, except that I might add once more, in the event of this highly unusual, revolutionary departure from present practice, if it could be shown, they would be entitled perhaps to some recognition for that unusual type of management. It is probable that such a type of unusual efficient management would be among the pioneers of any industry. That is bound to be true.

Redirect Examination Interposed by Mr. Slaff.

No, I would not say that all pioneering in an industry was included within what I have called revolutionary management. The mere fact that there is such a thing as pioneering does not necessarily impute something altogether unusual in efficiency of management. It is to be assumed that under given circumstances efficient management will always try to do the thing in the best way which science knows about or has developed, or can be developed under the existing degree of efficiency of the art in general.

Cross-Examination by Mr. Morgan (Resumed).

I think I got that expression "revolutionary" as a result of study and thought about this subject and what might be considered a reasonable interpretation of element No. 9. I think if the facts show in a particular inquiry that the conventional type of management, regarded by the industry as good management as of a given time, would result in a certain earning, and that by reason of a departure in the direction of efficiency from that conventional type of management increased earnings resulted under those circumstances, the company which has departed from the conventional and through efficiency increased its earnings over what they would have been had they gone along the lines that were usually followed, would be entitled to a higher rate of return under a proper application of element No. 9.

Going back to Chart No. 1, at page 7860 of the record, I made a comparison between the low point in 1936 and the figures shown for August, 1939, in which I pointed out that Aaa bonds and Aa bonds reflected lower yields in August, 1939, than at the low point in 1936, while for A bonds and Baa bonds the reverse was true, with the exception that for A bonds there was only a slight increase in August, 1939, as compared with 1936, of three-one-hundredths of one per cent. There was a perceptible increase, however, between the latter part of 1936 and the middle of 1939 in the case of the Baa bonds. I would say about one-half of one per cent higher in August, 1939, for Baa bonds than in 1936.

I think I can give you the relationship of each of the rating groups in September, 1939, to their 1936 levels. For Aaa bonds of thirty domestic corporations, 1936, the low point was 3.10; September, 1939, 3.25. Aa bonds, 1936, 3.28; September, 1939, 3.49. A bonds, 1936, 3.77; September, 1939, 4.05. Baa bonds, 1936, 4.52 as compared with 5 per cent in September, 1939. I have also the figures for the month of October here, if you would like those. For the month of October we have 3.15 for Aaa bonds against 3.10 in 1936; for Aa bonds, 3.35 in October, 1939, against 3.28 in 1936; October for A bonds, 3.94, against 3.77 in 1936; Baa bonds, October, 1939, 4.88, as against 4.52 in 1936.

1549 The difference between the Aaa and the Aa bonds is described at page 6 of Schedule 1, where Aaa bonds are shown as representing bonds of the highest type of investment. With respect to these bonds, the principal and interest are protected by characteristically wide margins, the fluctuation in which is not at all likely to jeopardize the security, and among all rating groups Aaa bonds hold the best prospect of unchanging quality. Aa rank high by reason of asset and income protection, but they lack one characteristic or another of the highest type of bond investment. I don't know whether it is someone or another characteristic that distinguishes the two classes of bonds. I don't know that the language is quite as definite as that. It does say one characteristic or another, but I don't think you can be too literal about it. I don't know how you can measure the difference between Aaa and Aa bonds because if one characteristic or another is lacking in Aa bonds, certainly there is a difference which Moody's consider worth noting. I agree that these Aaa bonds and Aa bonds come more nearly moving along parallel lines in comparing those bonds with the curves representing the yields of the other two classes of bonds—A and Baa.

The spread between Aaa and Baa bonds at the end of 1936 was 1.42. In October, 1939, the spread is 1.73. There is a wider spread in October, 1939, between Aaa and Baa bonds than there was at the end of 1936. If we go back of the depression period and take a look at the figures for December, 1927, it develops that the figure for Aaa bonds is 4.46, for Baa bonds, 5.32, which is a spread of .86 of one per cent. The spread at the end of 1927, then, was less than it was at the end of 1936, and still less than it was in October, 1939. That indicates to me that the investor is demanding greater compensation for the risks he undertakes; or, to put it in different words, he is willing to accept a lower yield in order to secure safety of principal and income. He is demanding greater compensation for risks in 1939 than he was in 1936 or 1927.

You ask which of those curves there do I regard as being more indicative of the situation obtaining with reference to financing through preferred stock or common stock. It would appear that with respect to preferred stock the yields would be more in line with those on bonds of A or Baa rating. The lower ratings of bonds are more comparable to preferred stock than would be the higher ratings of bonds because the element of security is lacking. That is true when you get preferred stock that has bond issues behind it. That observation as to lack of security is more true of common stock as compared with bonds. If we apply the observation I have made as to what this chart indicates, to financing through common stock, there would be a wider spread between yields of Aaa bonds in 1939 and the yields on common stock that year than would have been demanded in 1936 or in 1927, if we apply that method of determining the matter. On the evidence I would say that that indicates the investor is demanding more security and less risks. In the line of what I have said about those common stocks it would necessarily follow that there would be more compensation required for the risk going with the common stock in 1939 than was true in 1936 or 1927.

As a matter of fact, the greater preponderance of the financing through bond issues in the past several years would appear to be within the three higher rating groups so far as I can determine.

1550 Chart 6 shows a line which indicates the trend of the composite of Moody's bond yield averages for 30 public utility bonds with Moody's bond ratings of Aaa, Aa and A, with a line showing the average price of new capital on utility bonds, and those lines very nearly conform to one another which indicates, to my mind, that the bulk of the financing was by bonds of the three highest Moody's rating groups.

Passing over to page 2 of Schedule 7, it appears that the total volume of Aaa and Aa electric utility bonds is approximately $2,486,000,000. In the other two classes, A and Baa combined, the amount was approximately $942,000,000. The A bonds exceed the Aaa by about $130,000,000. That is for the last four years, 1935, 1936, 1937, and 1938. That circumstance indicates that investors are leaning toward security and safety, as I have already stated, that they are running away from risks, and that they are demanding higher returns for risks these last few years and at the present time, than they did in former years.

Chart 2 shows interest rates charged by banks. The figures for both 4 to 6 months' commercial paper and 60 to 90 day time loans were obtained from averages computed by Standard Statistics Company which are to be found appearing in the Commercial and Financial Chronicle; and I consulted with the Federal Reserve people in order to get an explanation of these two rates, and my interpretation based on that conversation was that these were the rates charged by banks.

I stated before that I believe the information portrayed by Chart 2 is pertinent, that insofar as these particular figures are concerned they are pertinent not because they themselves show what should be considered a fair rate of return, but because they represent just one more phenomenon to show that what is true of interest rates for one type of security, in general is true for other types.

Redirect Examination Interposed by Mr. Slaff.

My recollection is that I did make that statement on direct examination at the top of page 7865, because I wanted to have clearly understood the purpose of putting that chart in the record. I testified on direct that Chart 2 and Chart 3 are merely to portray historically the movement of interest rates, as such, and are not an attempt to offer short term money rates or yields on treasury bonds as a measure of a proper rate of return.

Cross-Examination by Mr. Morgan Resumed.

I may or may not have said in that connection that this is just another indication of yield required in one type of financial transaction as indicating the tendencies in other financial transactions. You ask whether the lower rate of interest on this type of short term paper may indicate difficulty in over-all financing of such institutions as defendants. I don't quite see the connection to which you refer, unless it would be to assume that defendants were seasonal borrowers, or something of that sort, which is not the case. I don't quite see the direct connection between what this chart shows and the difficulties that defendans would have. I have already testified this was not put in here to indicate what should be a proper rate of return, and from that it can be deduced that it doesn't follow here rates are those that would be applicable to any type of security for a public utility company.

1551 You are approximately correct in summing up my statement at the bottom of page 7863 and the top of the following page to mean that there was a parallel movement in all types of interest and that Charts 2 and 3 were offered as evidence of the tendency in a downward direction. They do show the present time interest rates of all kinds are down to about the lowest levels.

Yes, by that I mean interest rates on borrowed money rather than yields on securities of corporations of the junior type. I am talking about debt capital and government securities and commercial paper. I don't quite see the connection between the prevailing low interest rates on 4 to 6 months' commercial paper and 60 to 90 day time loans and the amount of money available for the financing of natural gas companies. I stated, and I repeat, that this exhibit was offered to show a broader background of interest rates than would be obtained by merely examining figures showing bond yields. In other words, I am trying to broaden the financial picture so that the reader will be better informed as to just what conditions were generally in the money markets. I can't see any connection between 4 to 6 months' commercial paper and 60 to 90 day time loans, and such capital as a natural gas pipeline company would require. I think the answer that follows from my previous testimony is that this would have no direct connection with the type of capital that these companies require. I think it is important in getting a general background to see what other factors exist in the money market, and whether bond yields, as such, are isolated as an indication of financial conditions, or whether the indications shown by bond yield averages carry through to the whole field of the money market. We gave it some consideration and decided that would be desirable.

This index does not move in the same fashion as bond yields, but it does show, especially since 1933, that the rates are at the lowest level since 1920; and I have already indicated that the same thing is true of bond yields in general. That is down to the most recent figures shown on that chart. I am merely comparing the figures of 1933 with the latest available figures that I had, in making that statement. The interest rates on the paper portrayed in Chart 2 and the bond yields portrayed in Chart 1 have not travelled together even as between 1933 and 1939, but at the same time the changes since 1935 have not been anywhere near as great in bond yield averages as for the entire period prior to that time. I think I am justified in making a generalization based on what appears to be a fact, that the changes in proportion, the relative changes, have not been very great during that period.

I can't trace a movement of bond yields and of interest rates on the paper portrayed in Chart No. 2, movement for movement, day by day, and month by month. I don't think the fact that they do not travel together indicates a lack of relation. I think you have got a general pattern here. In 1929 we had the start in our bond yield averages of something that indicated a virtual collapse of the bond market. In 1929 the interest rates on both types of paper were very high. I don't mean, and I didn't mean when I made the statement, that you could take each one of these lines and follow it down month by month and day by day.

There is a great amount of idle resources which has not
been put to work, and that, of course, is one of the
1552 things, in my opinion, that is responsible for the low
interest rates that we see here. I do not know that I
would answer that it is the major thing, as there are other factors involved, such as the fact that the Federal Reserve Bank has been buying in government bonds in the last two months or so in order to support the market for treasury bonds. I mean there are a good many things that enter into it; but I think that a very important one, that idle re-

sources are bound to create cheap money. It is a fair statement to say that the banks are full of money belonging to depositors who are not willing to invest it in the light of compensation promised for the risk involved. That is a matter of common knowledge in this country. I do not know whether the banks refuse to loan it or whether business refuses to ask for the money. You have got to look at both sides of the picture, I think.

Whichever it is, there is a congestion of money which is available for the type of loan that is portrayed here in Chart No. 2, which has driven the interest rate down. That would be a fair assumption.

My understanding is, from my inquires, that the four to six months' commercial paper is paper of such borrowers as meat packing houses who need these funds for seasonal purposes, and the 60 to 90 day time loans are loans to brokers, New York Stock Exchange, which are collateralized by securities subject to substitution from time to time. I think it would be a fair assumption to say that they are the very highest kind of bank loans known to business. I don't believe the four to six months' paper has any tangible security in back of it other than the credit standing, and so forth, of the borrowers. That credit standing involves the earning capacity of the borrower. I do not know that I quite agree with your suggestion that the property which the borrower has would be subject to execution in the event that the debt was not paid, but in any case, that paper is only extended, say, to borrowers who can give reasonable assurance by their history and present position that the loans will be repaid on maturity. The borrower had to convince the bank that it is going to get its money back and that there is not any doubt about it.

Chart No. 3 has to do with the yield on U. S. Treasury bonds. I stated in my direct testimony at page 7867 that the bonds included are "bonds due or callable after 12 years, as computed by the U. S. Treasury Department for the period since 1920." I think you will find at the bottom of Schedule 3 that the bonds were not due or callable for 12 years or more beginning with January, 1926. It states that earlier figures are for treasury bonds not due or callable for 8 years or more, together with certain liberty loan issues, so that the type of bonds would not be identical for the entire period. I do not know why they used 8 years at one time and 12 years at another unless 8 years was ultimately considered to be too short a period for long-term money.

In my direct testimony, I stated that the yield on treasury bonds portrayed in Chart No. 3, like the interest rates reflected by Chart No. 2, as such are not indicative of a proper rate of return for defendants. On the whole, I think the comments I made in my direct and in response to cross-examination going to Chart No. 2, would apply to Chart No. 3. As a matter of fact, the same congestion of money in the banks and in the hands of depositors has entered into the
low yield on government or treasury bonds. In addi-
1553 tion to that, there has been a supported market for
treasury bonds in the last two months. I believe that it has been a supported market for some time.

I cannot say that I recall that the daily press carried a story that the Federal Reserve Bank would withdraw support for U. S. Treasury bonds about the early part of September, about the time the war broke out. I do know that there was quite a fall in the price of government bonds and an automatic rise in the yields of those bonds about the time the war broke out. Since that time, the yields have tended to go down and the prices to go up to where they were prior to the outbreak of the war, but they have not reached that point as yet to my knowledge. That has been due to the fact that there is a supported market for those securities.

I think it is largely a fact that much of the money which has heretofore been invested in government bonds was induced into that investment by the liquidity of bonds as a sort of standby investment. People consider that government bonds are safe as a medium of investment. They are liquid. People are willing to put their money into that type of bond with a very low yield because they can get their money any time something offering more comes along. When there was a spurt upward in the business conditions resulting from the outbreak of the war in Europe, there was an immediate rush on the part of those holding government bonds to sell those bonds and turn them into money for use in other things. That not only applied to government bonds but to other bonds as well, I understand. That turned out to be a mere temporary flash. The market has not quite recovered with respect to government bonds, but has largely done so with respect to corporate bonds.

Charts Nos. 2 and 3 are relevant to some of the elements I enumerated, because they are a part of the picture of the whole economy and as such they do have relevancy even though they cannot be applied specifically in constructing a rate of return.

I think judgment would have to be associated in applying Moody's bond yields, portrayed in Chart No. 1, to a proper rate of return, because I think that Moody's bond yield averages are a step nearer to the immediate problem than would be the yields on U. S. Treasury bonds. Naturally, you would have to exercise judgment in undertaking to orient the one to the other, because of the very nature of the data.

My statement on page 7867 was to the effect that "from the data presented in this section it is seen that money rates are now lower than at any time since 1920, and probably lower than at any time in the history of the country." The section referred to gives a general picture, and that would apply to all three charts, numbers 1, 2, and 3, because all were included in this section.

I think the use of the term "money rates" is justified even though all three of these charts deal with interest rates. Interest cost enters into the cost of money. I just can't see the line of distinction involved in your question.

You ask if I would make the statement that the money rate going into the cost of natural gas pipeline companies is lower than it has been in the history of the country. I
have not made a specific study of the rates for natural
1554 gas pipeline companies. When I made that summary
statement, I was, as a matter of fact, summing up the deductions I made from Charts 1, 2, and 3, referring to yields on interest-bearing securities; but I think that it follows, while you can't perhaps impute a direct percentage relationship except by making compilations for that purpose, yet if the cost of common stock money is low, and it is decidedly lower than heretofore, it might be that that fact would have an important bearing on the over-all cost of capital, and preferred stock money would very probably follow the trend of bond money. Common stock money might tend to even increase when the other two decreased. As we have already seen, that cost of equity capital is subject to greater risks than other forms of capital; so the cost of common stock money capital would tend to be higher than the cost of capital represented by interest-bearing securities.

I made no study and have made no computation of cost of common stock money over a period of years. Of course, we know that in 1929 the common stock prices in the market were probably way beyond what was reasonable; and that would tend to make a very low cost of money if you were selling common stock at that time. That is a matter of common knowledge. But aside from one or two general observations of that kind, I could not make a detailed comparison over a great period of years and give you any direct answer.

The fact is then that these two higher classes of bonds portrayed in Chart No. 1, and the interest rates on the type of commercial paper portrayed on Chart No. 2, and the interest rates on government bonds, or U. S. Treasury Bonds, are not necessarily an indication of the money rates for equity capital. That is, they are not indicative of the total cost of obtaining equity capital. It would be more accurate in my summation on page 7867 if I had said interest rates instead of money rates, except that I feel that as to a strong company, which is paying dividends on its common stock, the market prices of its securities would vary from the market price of preferred stock, let us say, by perhaps one and one-half to two per cent absolutely. I did not point that out in this exhibit here or in my direct testimony. That is part of what I would say is general knowledge. I made studies which give recent indications of cost of common stock capital, so far as you can derive a cost for that kind of capital from market prices of outstanding stocks.

Over a great period of time, I could arrive at a proper level or trend of levels for financing through an issue of common stock. Over a reasonable period of time, beginning with 1931, the year the pipeline was completed, for instance, I could do that by some such process as was followed by the Federal Communications Commission in its study on rate of return, that is, taking two dates from any years and making my computations on that basis. (Objection by commission counsel, overruled.)

Strictly speaking, it is or was my intention, as I consider the matter at this time, that the rates to which I was specifically referring were interest rates, and not rates such as you have in mind, which would cover the entire cost of capital as such; although I realize that within reasonable limits it would be possible to proceed on the basis of known relationships prevailing or existing among yields on various types of securities, and to at least make a fair approximation of rates on preferred stock and common stock under current conditions; not, however, over a period of time that had not been studied.

1555 I do not see why my statement that "money rates are now lower than at any time since 1920, and probably lower than at any time in the history of the country," is not true even as to interest rates. I mean, the studies I have made seem to bear that out; and I believe I can refer you to a similar statement made by Mr. Willkie of the Commonwealth and Southern in proceedings before the Securities and Exchange Commission. No, Exhibit 185 does not show that that statement is not true. Well, now getting back to these exhibits, I think if you will refer to Chart 2 you will have no difficulty in following the indication laid down in my statement. I think if you will refer to Chart 3 you will have as little difficulty. If you refer to Chart 1 I think you will find that the composite rate on 120 domestic corporations in August, 1939, was 3.67 and in 1936, in December, was also 3.67. So I think my statement is fully justified. Those are the lowest bond yields for those 120 domestic corporations shown in Schedule 1 since 1920.

I believe it was quite clear from my testimony I was not talking about interest rates for particular classes of bonds, as the testimony includes statements giving exact details with respect to comparisons between 1936 and 1939 on different classes or groups or qualities of bonds. I think my statement will stand analysis in view of the facts reflected by Chart No. 1, because, as I said before, I am speaking in general terms when I make the statement. When you make a general statement, as I did, you try to get some index that represents an over-all picture, and I think by using that composite rate I have done just that. If I would have taken Aa bonds, for example, or Aaa bonds, you would have found the yields on those bonds were much lower in August, 1939, than in 1936, yet I didn't quote those in making my general statement. I was talking about money rates in general. My composite curve is not weighted in any way so far as I can gather. It is simply an arithmetic average of all the bonds included in the group of 120 bonds.

I believe you have to allow a witness some leeway in the matter of timing. In making my testimony, quite obviously I had to work when information was available to me and in front of me, and I did so. I think it must be obvious to everyone I was basing my statement on what was in the exhibit. I made my statement based on the charts and schedules included in the section of Exhibit 185 on general interest rates and yields. My statement was just a summary of that section as I saw it, as evidenced from the data and curves shown on the chart. Of course, when I make a statement that rates are now lower than any time since 1920, and probably lower than any time in the history of the country, that last section of the statement is naturally based on general observation or information which was familiar to me, having to do with the same subject matter as reflected by these three charts. But the statement was not altogether reflected by information which only went back to the year 1920. I mean it was quite obviously so.

If my general summary statement be applied to bonds rated A by Moody's or to bonds rated Baa by Moody's, it is not a correct statement of the situation. I did not make that statement with respect to those. I did not intend the statement to apply to those two classes of bonds. You ask me whether or not my statement would apply to Ba bonds and B bonds as rated by Moody's. That seems to raise a fundamental question as to the desirability or nondesirability of including bonds in the four rating groups in an average. When you talk about interest rates, money rates, you don't go out and pick the poorest or the least efficient company in existence and say that is a basis of generalization. My summary statement obviously does not apply to bonds in those two classifications, because I based my conclusion on what is here. That is all I intended in that statement.

I have stated that Chart No. 4 portrays the yields on Moody's forty utility bonds, rated Aaa, Aa, A and Baa, from the year 1934 down to August, 1939. I put that chart in there because I was trying to get from the general to the specific. I was trying to get from a composite average and
quality ratings of bonds to something that was more
1556 specifically related to the regulation of public utili-
ties. I did not put the Moody curve for industrial bond yields in separately by rating groups. I thought it sufficient to put in the utility bonds because my understanding is pipeline companies conducting interstate transportation of natural gas are subject to regulation in certain respects. I won't go into all the features. And in that sense such companies partake of the nature of regulated utilities. In other words, I was using the terms "utility" and "regulated company" as being synonymous. Investors probably regard natural gas pipeline companies as utilities if they read Moody's at all, because Moody includes pipeline companies in its public utilities manual. It includes such companies as Natural Gas Pipeline Company of America. The bonds of the latter company are not rated. I didn't mean to imply that. It has never included the bonds of the Natural Gas Pipeline Company in any list of rated utility bonds be-

cause they are not publicly held. They are held by the participants.

You ask how investors classify natural gas pipeline company bonds. I am not acquainted with many investors personally. I have not seen any of their portfolio lists, but even if I had, I don't think I would be able to make an answer to your question from it. Undoubtedly Equitable Life Assurance Society of New York has many investments. I can assume that it is a large purchaser of securities because insurance companies are.

(At this point, counsel for defendants handed the witness a pamphlet entitled "Schedule of Securities Owned by the Equitable Life Assurance Society of the United States, 393 Seventh Avenue, New York, December 31, 1938—" Objection by commission counsel to testimony with respect to above document overruled.)

You ask me to turn over to the caption "Public Utilities," in the list of securities, and see how many natural gas company bonds I find in that list. I find that there are one or two companies in here with which I am not quite as familiar as I should be to answer the question. I think it may be possible either the Kansas City Gas Company or the LaClede Gas Light might possibly be natural gas companies, I am not sure, but I can't base any conclusion on a hurried examination of this.

I notice in the utility bond section—assuming that there were no natural gas company bonds in the public utility bond section—I feel that would be inadequate as evidence to support the fact these companies are not considered as public utility. On the other hand, glancing through the book here, I find included under "Industrial and Miscellaneous," Northern Natural Gas, El Paso Natural Gas, Mississippi River Fuel, Panhandle Eastern Pipe Line, and Cities Service Gas. I don't believe I could take this as an evidence of what an investor considers the securities of the companies to be. I believe there are nine pages of bonds listed here. They list these five natural gas pipeline bonds under "Industrial and Miscellaneous." Kansas City Gas Company and LaClede Gas probably would not be pipeline companies. I was thinking of natural gas. You did say that.

Coming back to Chart No. 4, you asked if I note whether there is the same characteristically wider spread between the yields of the Aaa bonds and the yields on Baa bonds in August, 1939, the date to which these curves are extended, than at the end of 1936. There is a slightly wider spread in

1939 than in 1936: For Aaa bonds, 3.07 in December, 1936, and in August, 1939, 2.83; for Baa bonds, the low point in January, 1937, 4.50, and in August, 1939, 4.39. Now, the spread in 1936 was a difference between 4.50 and 3.07, which is 1.43; and the spread in August, 1939, was the difference between 4.39 and 2.83, which is 1.56. The spread had not materially widened, although it is wider. It is wider in the case of utility bonds as in the case of all bonds portrayed in Chart No. 1.

1557 The companies listed on page 3 of Schedule No. 4 are the companies whose bond yields are reflected as of the present time in Chart No. 4. I do not see any companies in the list that I would recognize as natural gas pipeline companies. With the exception of Peoples Gas Light and Coke Company, they all appear to be primarily electric or telephone companies. Peoples Gas Light and Coke Company is a distributing company which distributes mixed gas. Its bonds are classified as Baa bonds in Moody's classification.

Chart No. 5 portrays bond yield averages for bonds of 40 industrials, 40 public utilities and 40 railroads, comprising all of the bonds included in Moody's list of 120 domestic corporation bonds, for which the composite average yield is shown in Chart No. 1 of Exhibit 185. The 120 bonds represented by the composite curve are the same as those which make up the other four curves, Aaa, Aa, A and Baa. It is just a classification by types of business rather than by bond ratings. I have made no comparison of the curves shown on Chart No. 5 with a curve showing the bond yields on natural gas bonds over the same period. It might be helpful in orientating the information conveyed by this chart to the natural gas pipeline companies' situation if such a curve were superimposed on that same chart. I believe, however, that the information as to natural gas company bonds has been introduced in evidence in another exhibit by one of the company witnesses, so that information is available for that purpose. I would have to make the observation, of course, that the bonds shown in Chart No. 5 are bonds which Moody's classifies as Aaa to Baa, and, therefore, it would be necessary to make some grouping of natural gas company bonds according to quality; and, furthermore, it would be necessary to determine for such natural gas company bonds the particular type of natural gas company represented. By that I mean whether it would be a pipeline company, producing company, distributing company or wholly integrated company. In this inquiry it would be proper to select bonds of those gas companies which had the business of producing and transmitting natural gas.

I don't know that it would be extremely difficult to find pipeline bonds that would classify under these four classes. Moody's investment manual gives a considerable amount of information concerning the nature of operations of natural gas companies. Moody has not done the classifying. The classifying would have to be done by the investigator. I just stated that Moody's does not classify these companies, so far as I know, according to their grouping to transmission or distribution or so on. I am talking about the classification according to operation which I understood was what you meant. It may be that it would be difficult to find natural gas pipeline bonds that would classify as to ratings so far as Aaa bonds or possible Aa bonds are concerned. That statement is probably less true with respect to A bonds or Baa, and, furthermore, there are a good many natural gas company bonds which are owned by holding companies and not outstanding in the hands of the public which, of course, would not be seen in Moody's rating.

You couldn't make up these curves if you didn't have comparable information concerning market prices of securities outstanding in the hands of the public. I don't think 1558 there would be difficulty in orienting this to the requirements of this particular proceeding. If certain conditions as to capital structure and earnings are met, it certainly seems that one could impute from these facts some judgment which could be applied to natural gas company bonds. Before I would undertake to relate these curves to a particular situation I would first be faced with the necessity of including only those bonds which have a public market. Secondly, it would be necessary to obtain Moody ratings for each of the bonds which are outstanding in the hands of the public, and then it would be necessary to obtain market prices, daily average market prices, for each of the bonds. It would then be necessary to compute yields to maturity for each of the bonds. In other words, it would be practically a prohibitive task to make such a compilation which would be directly related to Chart No. 5 or Chart No. 1. That is not to say it could not be done, but it would not be a practical matter to attempt. I don't think it would be necessary to go through all of those motions before Charts No. 5 and No. 1 could be related to a proper rate of return, because, while information concerning bond yields over a period of years provides a good background of information, it can be assumed that bond yields in general for securities of this type would follow the pattern exhibits in Chart No. 5, and that if you were to obtain bond yields of reasonably current data you would have a basis of comparison which would be reasonably accurate.

Your question was directed to me concerning natural gas company bonds, if I am not mistaken; and I was attempting to explain how this chart could be used as a basis for drawing some conclusions concerning any type of bond which bore the characteristics of these bonds as to quality. I have already stated that it would not be necessary to chart the yields for natural gas companies. You ask if it is necessary to relate Chart No. 5 to the curves representing yields on natural gas company bonds. I believe I have already answered that question, describing the manner in which this chart could be used. Since you state that you have not followed me if I have stated how I am going to use this chart in relation to the rate of return for natural gas pipeline companies, I will repeat my statement. This chart reveals a pattern of bond yield averages of bonds carrying Moody's ratings, ranging from Aaa to Baa for 40 industrials, 40 public utilities and 40 railroads. Bonds exhibiting the characteristics of bonds classified by those Moody's ratings would follow the trends indicated in Chart No. 5, and that would be true for all kinds of corporate bonds. Therefore, if we know something about current market prices, current yields on natural gas company bonds exhibiting the characteristics of the bonds as to quality, I believe that the chart certainly speaks for itself as to what might be considered the course of the bond market for natural gas company bonds. I don't believe that I intended to imply that railroads, as such, had the same characteristics as natural gas companies; but I do believe, if you take my statement as applying to public utilities, that with that correction the statement can stand.

I didn't make the statement that all we have to do is look at the utility curve and then fix the rate for natural gas pipelines. I said you would have to consider, in relation to the pattern followed by the public utilities, the current conditions with respect to market price and yield on natural gas company bonds of the type under consideration. I

mean of the type as to rating. No, you couldn't take
1559 the two lower curves, the ones called 40 industrials and 40 public utility bonds, and from those chart the trend or the course of the yield on railroad bonds. The trends are naturally dissimilar. I think you will notice if you examine this chart carefully that it has only been since the latter part of 1937 that the curves for these various types of securities have exhibited a marked divergence from one another.

You ask me whether in the early part of 1937 I could have safely used the curves showing the yield on 40 public utility and 40 industrial bonds as an index to what a railroad yield would have to be. I would have to say that you have to go from Chart No. 5 and make a rather complete study in order to determine which of the 40 railroad bonds could be grouped under the various rating groups, and get some determination in that way. I think it would be necessary, in any case, to have some knowledge of exactly how many railroad bonds were included, and the proportion of the number in each group to the nominal number in each group; that is to say, whether there were 4 railroad bonds available for inclusion in a group of 10 required or not. Then you could get some idea. You would have to study the situation in order to determine what the status of railroad bonds was and you couldn't safely rely on a curve of this kind for that purpose, in my opinion. You would have to go behind the curve. We have already done that in connection with arriving at a rate of return for natural gas pipeline companies, not on this chart, but right in this connection in Chart No. 4.

Redirect Examination Interposed by Mr. Slaff.

It is not possible to get the whole story on rate of return from any single chart in Exhibit 185 or Exhibit 186.

Cross-Examination by Mr. Morgan (Resumed).

Exhibit 185 is not intended to be a complete story from which you could make a deduction for natural gas companies. You have to use both of the exhibits, 185 and 186. All of the charts in Exhibit 185 would be of assistance, in my opinion. I have already stated that this entire Exhibit 185 is intended as an exhibit to portray general economic and financial conditions over a period of years, with which any one would wish to be acquainted in forming any opinion on the subject of rate of return at this time. It is just a background and orientation, but that means a lot. It is not to be cast aside by the phrase "all it means."

Questions by the Examiner.

Going back a little bit to my statement that I would have to go behind Chart No. 5, speaking of railroad bonds, I meant that you would have to break them down into rating groups and find out, as we did for public utilities. The question directed to me was how I would go about studying rate of return requirements for a railroad. Well, we are not doing that here. We are studying the requirements of a public utility. I state in my exhibit before Chart No. 5, how Moody rates those bonds. The information is in there. It is in Schedule 1, pages 6 and 7, with respect to the bonds of the type represented in Moody's averages. You ask 1560 how definite the characteristics of a railroad bond are that Moody uses in determining his classification to which it should go. I have never consulted with Moody's but I think the key to their ratings, as indicated in Schedule 1, gives a very good picture. I believe the information could be obtained from Moody's. I don't know just what mathematical process or otherwise Moody's would go through in order to make their determination; but the results of their determination, as can be seen on Chart 4 in the case of public utility bonds, certainly show that there is a decided difference in the average yields of bonds according to Moody's ratings.

If you have, for instance, under consideration a rate of return on a security of the natural gas company which may be a pipeline or something else, the securities of which are not publicly held, you have no market indices. You ask whether I can do anything other than come to a general conclusion as to what category that type of security would fall into. I think there are a good many considerations involved there. You would have to decide, among other things, if the securities were owned by a holding company, whether the capital structure as dictated by the holding company represented what might be called a properly related capital structure; and, of course, it would not necessarily follow that because a company had 80 or 90 per cent of bonds in its capital structure, that that represented a properly related capital structure. I believe there are a number of factors bearing upon the inherent characteristics of a company which are made available in Moody's Manual of Investments, and it is possible to relate various ratios of one kind or another to market prices and find some consistent pattern that shows a definite relation exists between market price and other factors.

Cross-Examination by Mr. Morgan (*Resumed*).

You ask how I would orient to these curves here a situation dealing with a natural gas pipeline company that wanted to issue securities, 30 per cent bonds and 70 per cent common stock. (Objection by commission counsel overruled.)

I would take Chart 5 and I would ignore the railroad curve altogether because we are not dealing with railroads in this case and none of the underlying circumstances would be similar. I would next look at the curve for public utilities and find out what lies behind that curve. Then turning to Chart No. 4 I would see the rating groups of public utility bonds and yields for each rating group. I would then take Moody's group of 10 corporations rating Aaa. I would then turn to page 3 in which those ten corporations are listed. It would then be possible to localize the information and find out from examining the statements of these companies, which are available to the public, what characteristics those companies exhibit as regards capital structure; and if I found that on an over-all basis those 10 companies had a capital structure which indicated that 40 per cent of the outstanding securities consisted of bonds, I would say that a company which was going to issue 30 per cent of bonds could be expected, assuming that they were mortgage bonds, to merit a rating of Aaa, all other things being equal as to earnings, interest coverage, etc.

You ask whether anything else would have to be considered besides the percentage of the total capitalization represented by bonds. You would have to give some con-
1561 sideration to the company's history of earnings. If
it previously had securities outstanding you could refer to the market prices and yields on those securities. You could see whether there was any inflation in the fixed capital, and there would be other tests I possibly could mention but will not. That gives you a general picture.

I would consider the circumstance that natural gas comes out of the ground from reservoirs which are exhaustible.

In the case of a natural gas company you would want to see that the bonds had a sinking fund requirement that would permit their retirement so that there would not be any such obligations outstanding beyond the useful life of the gas field. I don't know just how far short of the indicated life of the field they should mature. I would have to know whose indication of the life of the field it was and on what basis. There are a good many things to take into consideration.

These considerations lead a considerable distance away from the mere determination of the per cent of the capitalization represented by bonds. I did not mean to imply a mere thirty per cent would be sufficient; but I say it leads you to a comparison and study of bonds in the Aaa classification, and, of course, you would have to take in the other factors to see if the company in particular exhibited qualities and requirements that would be necessary to make the bonds merit an Aaa rating.

I am quite sure there are no Aaa natural gas company bonds, that is, pipeline company bonds. I believe Southern California Gas Company, which conducts some transmission operations, has bonds rated Aaa. I would say it is probably largely a distribution company. What I had in mind as a possibility was the Southern Counties Gas, and I believe that is primarily distribution also. I can't say that I know of any natural gas pipeline company whose bonds are rated Aaa or Aa. The Panhandle Eastern Pipeline Company has bonds rated A. There may be smaller companies than those in here which would have A ratings, with which I am not familiar. I don't happen to know of any.

You ask why I would go back to Chart 4 and use that chart in connection with the public utility curve on Chart 5, if I were going to relate Chart 5 to the rate of return required by natural gas pipelines. If you will look at Chart 5, as I have stated, you see the curve for the 40 public utility companies. The reason for selecting that particular curve is, as I have previously stated, that the natural gas pipeline company that conducts operations involving the interstate transportation of natural gas, and is subject in certain respects on that account to regulatory action, certainly seems to exhibit the characteristics of a public utility. A railroad is subject to regulation, of course. I don't believe you want me to say a railroad is comparable to a natural gas company. I think a telephone company is much more nearly comparable to a natural gas company than a railroad be-

cause it is in the business of rendering a service to consumers in communities. A railroad does not do that as such. To my way of thinking, a railroad doesn't remotely resemble a company that furnishes gas, electric or telephone service. It is an entirely different kind of service. A natural gas pipeline company that sells gas at wholesale doesn't furnish gas directly, but it certainly does furnish it indirectly. Yes, a railroad brings the groceries to town and the grocer sells them, just like the Natural Gas Pipeline Company brings gas to the town and The Peoples Gas
1562 Light and Coke Company sells it. You can hardly
consider grocery stores as public utilities.

You presented to me yesterday a pamphlet which purported to show, in the case of one insurance company, natural gas company bonds were carried as "Industrial and Miscellaneous." I have told you or testified that Moody's Manual of Public Utility Investments shows pipeline companies in its manual to be public utilities. You might refer to the Bond Quotation Record and the Public Utility Bonds and you will find natural gas companies listed under public utility bonds in that source. Just what action or decision the investor is going to come to as to whether they are public utilities or not public utilities, is something I can't predict; but I certainly think he is just as much entitled to base an opinion on the Bond Quotation Record as he is to base an opinion on a pamphlet which indicates the securities are securities of industrial companies.

I was trying to indicate that to the investor there is just as much reason for considering this company as a public utility, based on the facts I have mentioned, as there is for him to come to the conclusion it is an industrial company because it happens to appear as such in the little pamphlet put out by one insurance company. Therefore, I would say the bonds of the natural gas companies, pipeline companies, distribution companies, and what not, are logically to be related with public utility bonds rather than railroad bonds. I think that I was leading up to that reply and I think that would be my answer to your question.

I would like to point out with respect to Schedule No. 4, page 3, to which you have made reference as already has been indicated, that we find no Aaa bonds among natural gas pipeline companies; that we find no Aa bonds among natural gas pipeline companies; and we find no A bonds except that one, the Panhandle Eastern, whichever group that fell in. As for Baa, there may be some bonds in there. I would not be surprised. In Exhibit 186, Schedule 5-A, you have the Houston Gulf Gas Company, the Oklahoma Natural Gas Company and the Southern Natural Gas Company. If you are setting out to make a list of representative public utility bonds, even if you consider those companies as public utilities, you would not necessarily consider them as representative in every characteristic of the type of bonds for this schedule.

These curves on Chart 4 reflect the actual yields on the particular 40 bonds whose yields make up the curve. There is no natural gas pipeline company in there in the case of the chart. In the rating group there could not be any natural gas pipeline company bonds in there.

I would say the ratings shown on Chart No. 4, which form the basis of the composite curve on Chart No. 5, grow out of the yields of bonds which I have already said were predominately those of electric, telephone and gas distribution companies. I would put the electric company first. They are predominately electric. They are predominately electric and gas utilities with some telephone utilities, but a much smaller number of telephone utilities are represented there.

1563 In the sense that it has a commodity to sell, it is my theory that a natural gas company which produces natural gas down in Texas and brings it through pipelines to Chicago and to some towns west of Chicago and sells it at wholesale, is more comparable to a telephone or to an electric distribution company than it is to a railroad. A telephone company sells service. It could almost be considered as selling a commodity. Of course, it is not a physical commodity. It is a service that enters your home. If you didn't have gas you couldn't serve it. Electricity is a commodity in the sense I am using that term. You can't touch it unless you want to get a shock. It is a commodity.

A lot of the expense of the telephone company and electric company is made up in the service and the expense of getting the small quantity of electricity or the reflection of the human voice into the home. Naturally, all of their equipment, all of their operating expenses, are designed for the purpose of rendering service. There is no question about that; but the whole point of bringing gas up from the Texas field to Chicago is to render service likewise. The fact that for the past several years the yield for public utility bonds is substantially lower than that of railroad bonds would have nothing in the world to do with it, in my opinion. I don't believe it would have made any difference in my answer if I had been considering the matter back of 1935 when railroad bonds were yielding less than public utility bonds. I would still stay with utility bonds if I were considering a natural gas pipeline company.

You ask me to explain why railroad bonds showed consistently lower yields during the years 1933 and 1934, and then cross and become substantially higher than the 40 public utility bonds whose yields are reflected here. My answer would be based on general observation, not on the detailed study. I would say that the depression largely caught up with the railroads, and since that time their earnings have continued to fall off and by the time 1937 rolled around investors considered there was too much risk and perhaps not enough earnings to warrant their continued investment. They were wiser to some extent to the extra risk they assumed. This is another instance illustrating that there is a demand for a higher return for risk. I think that is just an elementary principle of financing.

You ask for my explanation of why industrial yields, which were consistently higher than the yields on public utilities until about the end of 1932, crossed over and since that time industrial yields on these particular bonds have been consistently lower. For one thing, reference to Schedule No. 1, page 8, shows that there are only four industrial bonds with the Aaa rating which were available for inclusion in that group. On page 9, as indicated, there are only three industrials whose bonds were available for inclusion in the Aa group. On page 10 it is indicated that there were but eight industrials whose bonds were available for inclusion in the A group, and not until we reach the Baa group do we find the full complement of ten industrial bonds; and I think the answer to your question is, it is largely due to the fact that only the very highest type of industrial bonds were included in these averages, and that
these were the only bonds available; and I believe that
1564 had an effect in tending to keep the yield curve for
industrials as low as it appears. Nothing but the very highest type of bonds could meet the specifications for these higher ratings except in a few isolated instances. I would not agree with you that this industrial curve does not turn out to be of much value as an index. An index is designed to show something and this curve does show something. It shows something in the sense that any indexes of financial or economic conditions show something. They give you the

picture so you can see the relationship of one group of securities to another; and it gives you the necessary background of information which it is quite essential to have to get an all around picture.

The specific deduction is that it takes an exceptionally high grade or high class industrial bond to command these low yields reflected by these curves. That is true of any curve of high type securities. It takes high type securities to get into the grade that makes that curve. I do not follow the reasoning that that indicates there is more risk involved in industrial than in utility investments. I don't see how I could agree to that from this evidence alone. The mere fact that the industrial bond is not there is what keeps the ordinary industrial bond from qualifying. It is true that my quoted description of an Aaa bond means a bond that is practically free of risk, as nearly as a corporate bond can be made such. Then if industrial bonds cannot qualify as Aaa or Aa or even A in representative numbers, that indicates that there is more risk in industry and it is harder for their bonds to be brought within the specifications for these higher classifications of bonds.

Question by the Examiner.

The Moody averages are straight arithmetical averages and not weighted averages.

Cross-Examination by Mr. Morgan Resumed.

The term "new capital" used in the caption, "Average Price of New Capital" on Chart 6, means newly issued domestic bonds. I think that is explained in the second line of the caption. It says "Moody's Weighted Averages of Yields on Newly Issued Domestic Bonds". That does not mean new capital as opposed to existing capital which is being refunded in the issue. It includes all kinds of new issues of domestic bonds during the whole period from 1921 through 1938. It has to do with railroad bonds, utility bonds and industrial bonds, just like the other charts. The line "F. P. C. Compilation Electric Operating Companies" represents an F. P. C. compilation of electric operating company bond yields. There is no separate segregation for natural gas company yields. I have not made a compilation of the issues included in the various lines, but I should state that Moody's have prepared these bond yield averages and the logical deduction would be that they have included in the various curves the bonds of any rating whatsoever of companies which they classify as public utilities, railroads and industrials. The line captioned "Composite of Moody's Bond Yield Averages for 30 Public Utility Bonds with Moody's Bond Ratings of Aaa, Aa and A (10 Bonds in Each Group)", has been superimposed on this chart to show what the composite average of Moody's bond yield averages is for 30 public utility bonds of the character indicated. The other curves on that chart represent weighted averages of yields on newly issued bonds of all descriptions.

1565 During these last few years there has been a perceptible decline in the bond yields indicated. They began to fall in 1934 and they have continued toward lower levels, rapidly during 1934, less rapidly in 1935, and have tended to level off in 1937 and 1938. I think by reference to Chart No. 1 it can be seen, pretty generally, that the trend has been downwards for bonds of higher ratings and that would be the explanation that I would offer for the rapid decline in the yields of bonds during that period. That is the reason for superimposing this curve which shows that the trend pretty closely conforms to the trend for 30 public utility bonds of Aaa, Aa and A rating in each group. In other words, the financing through bonds during those years has been overwhelmingly of the high type bond character. I think the circumstance that a very large proportion of the financing was of a refunding character has an effect which cannot be ignored. Of course, we all know that the majority or the major portion of new financing has been refunding during this period. It has been refunding of the very highest type of bonds. During this time I would say it is less costly to a company to refund an existing debt, where there is an earnings experience and property coverage behind it, than it is to go out and get new capital.

I believe it is true that it is more costly to go out and raise capital for the purpose of developing or constructing an industry from scratch or as a new enterprise, than it would be to get additional money to expand an existing enterprise. You ask if I think that the course of these yield curves during these four or five years is a very safe index to the proper cost of money for the natural gas pipeline business. That answer will have to be broken down, because it will depend upon the question of whether the natural gas pipeline company in particular is a well established company or one that is just proposing to construct a pipeline at this time.

You ask if it is my theory that a company which is well established is entitled to a lower return on its investment than one which is just starting out in business. (Objection by counsel to Illinois Commerce Commission overruled.) My theory is that every company in the public utility business should be allowed a fair rate of return, and a fair rate of return must take into consideration all circumstances in individual instances. I testified this morning that a company which was established in business could obtain money at a lower rate or at a lower cost than one which was just starting out in business, and that that would have to be taken into account in applying the facts reflected by the curves in Chart No. 6 to the financing problem under consideration. The mere fact that a company is starting in business does not entitle it to charge rates which represent a cost of service to the consumer at more than its real value. I think that the rates of companies in the same general type of business should be considered, rates in the same general area, and that some judgment based on such an investigation would have an influencing effect upon what might be considered a proper rate for the company in question. You ask me to assume that one company is selling natural gas at a price which, when compared with the prices charged by other companies selling the same commodity, is lower, and to state whether I think that circumstance should be taken into account in arriving at a proper rate of return. (Objections by counsel for the two commissions overruled.)

My answer to that is that a mere difference in rate 1566 levels does not afford a basis for determining whether a rate of return is fair or not. If in the case in question the rates were based on operating expenses that were reasonable for the type of operation involved and the type of operating conditions involved, a difference in rate levels would not express a differential in favor of one company as against another. My answer just before the last one, taken in conjunction with the underlying basis upon which rates are predicated, I think fully answers the question that was directed to me.

You ask me to assume that two pipelines are coming from the same gas field, are of the same type and have the same cost, and are built to the same general vicinity where the gas is marketed or to be marketed; that one of them has been in existence for several years and has an earnings record which will enable it to borrow money at a lower rate than the other company which it is assumed has just been completed and just launching out in the business; and you ask me to state whether or not I think one of those companies should have a higher return than the other. In this connection you state that you are assuming that they are in the same situation in every respect, except that the one is just launching into business and therefore is not in a position to borrow money as cheaply as the other. It makes a very great difference in my opinion whether or not they are competing companies, because it might not be economical for a company to compete with another company and go to the expense of constructing an enormous pipeline for the sole purpose of competition with an associate company, and if it is not economically feasible there wouldn't be any proper basis upon which to establish rates for an enterprise that was not feasible. If there is room for both of them so that each one is supplying a part of the needs and I am examining the rate of return for both of them I don't think there would be any distinction whatsoever in the rate of return to which each would be entitled because one was in a position to borrow money at a lower rate than the other. You ask me which cost I would take in weighing the cost of money as an element entering into the proper rate of return as between the cost to the well established company and the cost to the company just launching into business. (Objection by counsel for Illinois Commerce Commission overruled.) I think it would be necessary to predicate the weight upon the reasonable value of the services. A company which commenced a project such as you have outlined would be well aware of the fact that a neighboring company was already in existence and operating; and it may be presumed that very careful studies would have been made of that company's experience before the project was undertaken.

Now, the mere fact that this second company is newly organized should not operate to produce rates that are not reasonable in the light of operating conditions and operating expenses. If the cost of capital for the second company is excessively high in comparison with that of the established company it would appear to me that the cost of capital to the extent that it is excessively high should be ignored. I don't believe I can give you a categorical answer which is based purely and simply on the difference between the cost of money in the two cases. I think it would have to be

determined upon the basis of what kind of a capital structure the new company was going to have and what its proposed or expected earnings were. There are very many considerations involved. I don't think I can give you any categorical answer. There are too many unknowns in the question. We don't know what the proposed earnings are. We don't know what the proposed operating expenses are unless you are assuming in this example they are to be exactly the same as those of the first company. If the capital investment, operating costs and risks, since they
1567 come from the same place to the same place, are the
same, and everything, including the capital structure, is the same, except one is new and the other is old, and except one is on an earning basis and other is not, and the well established company can get money at a lower rate than the one just launching into business, I would say that if the new company cannot secure capital at what is considered a reasonable cost, it ought not to go into business.

A company is entitled to a rate of return, as I understand it, on the basis of its needs. Those needs are based upon rates sufficient to assure confidence in the soundness of the utility, to obtain the required capital and to maintain its credit standing. If in view of all the circumstances surrounding the particular company it is found, as you have stated as a premise, that the cost of capital is reasonable, then my answer is that if all expenses and costs are reasonable, and in the light of all the circumstances, then the particular circumstances of the individual company should be the basis on which the rates should be established.

Just what circumstances the Commission would take into consideration in making its final decision is something I cannot prophesy, but I know it would be necessary for it to take into consideration all the circumstances. I have no basis for deciding the answer to your question as to what the Commission would or might do. I don't know whether it would be proper for me to answer as to what the Commission ought to do. I still think it involves a prophesy. I see you have asked in that question for my judgment. Well, this is a hypothetical case, I think you will have to admit that, and I don't know whether in the brief time I have in which to answer the question I could give that subject serious enough consideration to give an answer that would in all purposes be a just answer.

Yes, I have brought here a lot of data and charts and curves showing the cost of capital obtained through bonds, and in one place through preferred stocks, of electric utility companies. I have stated I brought them here because they were relevant and pertinent to an inquiry on rate of return. I have stated what the elements to be considered in arriving at a proper rate of return are in my judgment. You now want me to tell you whether I am talking about cost of capital to an established institution or cost of capital to an institution that is just being launched. Considering all circumstances, reasonable cost of capital, reasonable operating expenses, and an economically feasible project, the cost of the service under such circumstances should be the reasonable rate in view of all these circumstances. I don't know that I can get any closer to an answer to your question.

I have said that in order to prevent injustice the rates charged by others under similar circumstances and similarly situated was an element to be considered. I said it had an influencing effect. I should think it should be considered. It is something that has to be taken into consideration. I was speaking of the rates and not the rate of return.

When a group of men are considering the building of a natural gas pipeline, they are confronted with the problem of raising capital with which to buy that pipeline and the equipment that goes with it and the reserves that are
1568 necessary to sustain it. They are confronted with the necessity to raise that money as a business which is being launched. You ask whether or not I think the rate of return should be fixed on a basis of the cost of capital for that pipeline as it was being built, or what they could go out and borrow the money for at the time they had the pipeline in a completed condition as far as cost of capital is concerned. If we assume that it has a contract for a specific term with a distribution company, just like it would have had it been there for 10 years and was operating under those circumstances, it would seem to me in that case that the cost of capital to that company would be fairly comparable to that of a company that was already established.

In a rate of return inquiry under those circumstances, that element which I have denominated cost of capital would be one of the elements that would have to be considered. You ask me whether I consider the cost of capital to him as that cost which he incurred as he built his pipeline, which he has just completed, or as what he could go out and borrow money for to retire his securities or part of them. I think you have to deal with the facts as they exist. Just to make it more specific. If they borrow money to construct this pipeline, you would have to deal with the cost of borrowed capital as an element to be considered in determining a proper rate of return. I did not imply that you would have to accept the cost incurred in getting the capital to build the pipeline. You have to take it into consideration. If he went out and did the best he could and got it at as low a price as possible that is another thing altogether.

I don't know whether I can clear this up or not, but I will try in this statement. I think I have already stated that if the cost of money is reasonable, if the cost of operating expense is reasonable, if all the factors and circumstances indicate that the cost of capital is reasonable, then that would indicate that the cost of capital is a factor that should be considered in determining what constitutes a proper rate of return. I assume when you say cost of capital to an established institution that you are referring to what might be called current costs or historical costs. If I understand your question correctly, it is the cost of capital to the company that is going into business that I have been discussing. I don't know that in every instance it could be said that new capital being raised for the purpose of launching into a new business costs more than capital raised through the securities of an established business.

In connection with refunding issues I said that the average price of new capital indicated by Chart No. 6 was quite predominately influenced by refunding issues. That would be current capital costs to established companies. That is an element in it, at any rate; and if we assume, for the purpose of argument, that the capital cost for a new company is larger to some extent, my answer is that if it is to a reasonable extent it would have considerable influence in determining what the proper rate of return should be for that new company. As between the new company and the established company, if a reasonable cost, all things considered, is higher to the new company, it would seem a fair statement to make that the rate of return for the new company should be largely influenced by the cost of capital which it incurs, with all of the qualifications that I have previously made. That might conceivably lead to a higher price for gas for the new company than for the old one.

Yes, it is fundamental in a rate of return study that what you are attempting to find is a rate of return which will offer an inducement; but that has to be qualified. It may not be any rate that may be required to induce capital. It has to be a reasonable project. All the circumstances have to be reasonable. Other things being equal and confining it to this one element that is now under consideration, the inducement allowance should take that factor into consideration. I have already stated that one of the principles is that the return should be sufficient to assure confidence in the soundness of the utility, to obtain the required capital and to maintain the utility's credit standing.

Cross-Examination by Mr. Morgan Resumed.

It is conceivable, surely, that a rate of return which will induce investors to enter a given regulated business, or attract capital to that regulated business, if it has to do with an enterprise just being launched, might be different than it would be five years later after that same business had a record of earnings behind it.

You ask whether I think that men would be attracted to put their money into a business by the promise of a rate of return which would get their money into the business, if they thought that as soon as they got it in the business and got the business going, the regulatory body would turn around and take away from them a part of the return which they expected when they put their money into it. (Objection by counsel for the two Commissions overruled.) I think it is fundamental that investors, intelligent investors, realize that utilities are subject to regulation, and, therefore, it may be assumed that they have given consideration to the possibilities in the future of rate reduction; but it need not be assumed that the rate reductions referred to would be such as to reduce the rate of return below what would be a fair and proper rate of return. I mean, based on the company's cost of capital and with all other things taken into consideration, there is no apparent reason to assume that regulatory authorities would reduce rates below what is proper and fair. (Objection by counsel for Illinois Commerce Commission overruled.) If the investor's demands were not to be met, he would not be in the situation, presumably.

You ask me whether, in the light of my testimony concerning the comparative yield on refunding securities and the high proportion of refunding indebtedness that is represented in the transactions reflected by Chart No. 6, and my testimony concerning the predominance of high rated bonds involved in the transactions making up those curves, I agree that it would be dangerous to place any substantial weight on the bond yields reflected for the years 1934 through 1937, on Chart No. 6. I don't know that I have given any specific weight to Chart No. 6. I believe the facts in Chart No. 6 deserve complete consideration in the circumstances you have mentioned.

You ask whether or not, in arriving at an over-all rate of return for a natural gas pipeline company, which 1570 I have stated is not represented on Chart No. 6, I would have to exercise very special care in order not to be steered in the wrong direction by the course of those curves for those last four years. I hesitate to answer that by a simple "Yes", because I don't think it would be so. Certainly the chart indicates a trend in the cost of bond money; and to the extent that it does indicate a trend it might be reasonably imputed that the trend of money for established enterprises, which, of course, reflects market conditions, would likewise be reflected in the cost of money for even a new enterprise, because the cost of a new enterprise is based on market conditions.

I am familiar with the study entitled, "The Problem of the Rate of Return in Public Utility Regulation with Special Reference to the Long Lines Department of the American Telephone and Telegraph Company", conducted by the staff of the Federal Communications Commission. I have referred to it on numerous occasions and frequently consult it. I quoted from it yesterday in stating the ten elements to be considered in arriving at a proper rate of return, not from this volume but from another volume of the same study.

I am familiar with the source of the figures at the top of page 55 of the volume above mentioned. Those figures are taken from Moody's. In connection with the table shown at the top of page 55, there was a chart in Moody's just like my Chart No. 6 except that it covered a different period. This tabulation appears to cover a period two years less than the period covered by my Chart No. 6. It has an added column there, "Preferred Stocks". The figures are in the same general section of Moody's and are undoubtedly under the same caption.

You ask whether or not I agree to the following language appearing in that study of the F. C. C. on page 55:

"Table 1 shows that the annual average yield on all newly issued public utility bonds varied between five and six per cent during the period 1923 to 1930, inclusive, and declined to an average of 3.84 per cent for 1935 and 3.55 per cent for 1936. This comparison of the costs incurred in two relatively normal periods suggested a marked decline in the cost of secured capital. The data may be misleading, however, unless their composition is carefully analyzed."

I think you have to analyze all statistics, including these, if you are going to obtain any benefits from them.

I have, myself, stated in substance and I agree to the next statement you have read from the same study, as follows:

"In the first place, a much larger proportion of the bonds issued during 1935 and 1936 were for refunding purposes than was the case in the earlier period."

That is true also for 1937 and 1938.

You then ask me if I agree to the following statement from page 56 of the same source:

1571 "Table 2 shows that the total volume of issues during 1935 and 1936 was comparable with the volume during the most active years of financing prior to 1932, but that the proportions of refunding issues were greatly different. During the earlier period, utility bonds were sold largely to finance extensions and improvements, as is indicated by the fact that from 1923 to 1930, inclusive, the percentages of new funds varied from 60.6 to 90.8. In 1935, however, only 6.7 per cent of the total bonds issued were for new capital, and in 1936 the proportion was even smaller."

I agree to that statement.

I also agree that the following statement which you have read here is largely true:

"It is probable that, in general, the cost of capital to replace funds already committed to a particular enterprise is less than would be the cost of an equivalent amount of additional capital."

There may be exceptions, but I think I have already stated that in effect.

I also agree to this statement in the study from which you are reading:

"Refunding does not represent an additional demand for savings."

I agree also with the following statement read from the same source:

"Furthermore, when refunding takes place, a definite earning experience is available for the information of the investor, and the uncertainty is less than where the same utility proposes to expand its productive activities in order to serve new segments of the market."

I agree also to the following statement from that source:

"The change in quality of the securities issues has been even more important than the decline in the proportion of new capital. Table 3, which is limited to new and refunding bond issues of operating companies, shows the percentage distribution of bond issues by the Moody's rating first available at the time of flotation. The greater proportion of the issues were in the A and Baa groups during the years prior to 1929, but the shift toward the higher ratings has been so pronounced that 79 per cent and 65 per cent of the total volume were of Aaa or Aa rating in 1935 and 1936, respectively."

I agree to the next three paragraphs read from the same study, as follows:

"The preference of the investor for bonds of higher quality, and the ability of corporations with the best credit to refund, is in part responsible for the downward movement of the index of yield on newly issued utility bonds.

1572 "If this index were plotted on chart 4, page 62, it would fluctuate during 1926, 1927 and 1928 in a position between the yields on Moody's samples of outstanding A and Baa bonds. During the recent period of renewed financing, the index would fluctuate above and below the average yield on Moody's Aa bonds. The trend of this index of yield of offering prices of new issues illustrates the dangers inherent in the use of averages.

"Table 1, page 55, also includes Moody's index of yields on newly issued preferred stock. During much of the period, the volume of preferred stock financing was so small that the averages do not possess much significance."

That last paragraph has to do with the early part of a period mentioned here, which is prior to 1936, and to that extent I agree with that observation. There have been a considerable number of issues of preferred stock since 1936. They were probably largely refunding issues in order to obtain lower dividend rates.

I agree also with the statement from the same source above referred to, reading as follows:

"Nevertheless, it may be observed that the differential of yield on preferred stock over yield on bonds tended to average about one per cent."

Redirect Examination Interposed by Mr. Slaff.

I agree with the statement contained on page 61, which you have read, from the same source as that from which counsel for defendants has been reading, as follows:

"Regardless of the long-time trend of interest rates, it is apparently that during the past few years it has been possible for utilities, especially those with the best credit rating, to secure large amounts of new and refunding debt capital at very low prices, and there are indications that this situation will continue for some time in the future."

Cross-Examination by Mr. Morgan Resumed.

The statement Mr. Slaff has just read is no more than I have already stated from my charts here.

Questions by the Examiner.

All the data on Chart No. 6 is taken from Moody's except the F. P. C. compilation. The industrial bonds, railroad bonds and public utility bonds shown on Chart No. 6 are not the same bonds as those listed in connection with the previous charts. The bonds shown on Chart No. 6 are newly issued bonds and they are not the same at any two dates or during any period.

1573 *Cross-Examination by Mr. Morgan Resumed.*

You point out that at page 7871 I stated: "Chart No. 6 shows the average price of new capital as indicated by Moody's weighted averages of yields on newly issued domestic bonds of industrial corporations." The use of the term "average price of new capital" may be inaccurate. I have used the terminology that was found in Moody's manual and that would explain why I used that caption. Of course, as I pointed out before, the caption immediately following that has the effect of qualifying it, so that I do not think it is really misleading if you look at and study the chart. The terminology "average price of new capital", as I have just stated is a terminology which was devised by Moody's, and for which they have given a definition in their manual, and I have given that definition in my testimony. When I speak of the "average yield to maturity on newly issued bonds," I mean the yield to the purchaser of the security. The terminology "yield" is generally understood to mean the yield to the purchaser.

In my Schedule No. 7, pages 1, 2 and 3, and Schedule No. 8, pages 1, 2 and 3, I have the figures which are shown in curve form in the heavy line near the lower right-hand corner of my Chart No. 6, except that Schedule 8 goes beyond the chart. That schedule goes into 1939 and the chart ends in 1938. The back-up for that part of the curve or chart which is identified by the words "FPC Compilation Electric Operating Companies," is shown on pages 1, 2 and 3 of Schedule 7.

I picked electric companies in adding to Chart No. 6 for the reason that in so far as natural gas companies were concerned, it was understood that there was to be another exhibit prepared and it was thought desirable to have some relative information on this subject concerning electric utility bonds. I think electric and gas utilities exhibit very similar characteristics. The analogy is not primarily between pipeline companies as such and electric utilities; but it is an analogy between the natural gas industry and the electric utility industry. It is true we are concerned in this proceeding with natural gas pipeline companies as such, but natural gas pipeline companies are certainly dependent upon natural gas distribution companies for the disposal of their product.

As I have just stated, we have a separate section devoted to natural gas statistics and securities and it didn't seem necessary to repeat that information in this study. You ask in what exhibit I have made a comparable study of gas utilities. I don't know if it is comparable in every detail, but certainly, in general, Exhibit 186 gives a picture of the natural gas industry that is somewhat similar to that shown for the electric utility industry here. I am referring to all of Exhibit 186. I have made no detailed study of Exhibit 186, but from the testimony I heard concerning it, my understanding is it included pipeline companies, perhaps one or two fully integrated companies, perhaps one or two companies which owned pipelines and also producing fields. I am not trying to tie myself down specifically. As I stated, I am just trying to give you the general impression I got from listening to the testimony.

You ask if, as a matter of fact, I think gas companies engaged in the distribution of natural gas are closer in their relation to the natural gas business than are utility companies engaged in the distribution of electricity. If you mean physically closer I would say natural
1574 gas distribution companies are more closely related.

That would be true also of the artificial gas company. Very often the artificial gas company forms the initial market outlet for the natural gas pipeline at the beginning of operations. I know from this record that 90 per cent or more of all the gas that defendants transport and sell is sold to companies who distribute a mixture of artificial and natural gas.

From a financial standpoint I don't know that I can quite agree with your suggestion that it would be getting closer to the natural gas pipeline company if I had used a curve and data concerning gas distribution utilities rather than electric utilities. The general picture regarding electric utility bonds and securities is general information about a business that is similar in that it is a utility business. I think it is relevant, pertinent and necessary to show the facts and figures concerning the yields on bonds of both electric utilities and gas utilities. I didn't put the gas distributing utility figures in for the reason the exhibit on natural gas securities was intended to cover the field of natural gas pipeline companies; and I don't know that there is any closer relationship from a financial point of view between gas distributing companies and gas pipeline companies than there is between electric utility companies and gas pipeline companies.

You ask me if it would not be more logical, if I am going outside the pipeline companies and relying on this orientation line of testimony presented in Exhibit 185, to put in some curves and data concerning the bond yields of gas distribution companies rather than electric utility companies. My answer is I don't think so from a financial point of view. Not having attempted to do that I can't say whether I would have gotten a different result or not. I do know there is some evidence of record already regarding gas company bonds. I do not know whether the electric utility business is the most prosperous of all the utility distributing businesses. Only two commodities of that nature are being distributed, electricity and gas. If that is the comparison that you are making, I couldn't answer that question without making a more detailed study.

In connection with my discussion of Chart No. 4, I agreed this morning that the bonds listed in all four of these classes are preponderately electric utility bonds. It is true in many instances the companies also have gas properties and distribute gas. I did say they are preponderately electric. Only one gas company is shown in the whole list, Peoples Gas Light and Coke Company, and it has the lowest rated bond of the four ratings represented in the group. You ask me if that isn't an indication that there is a preference among investors for the type of security that the electric utility business can offer rather than for the type that the gas business can offer. I wouldn't like to make a yes or no answer to that. It does happen that natural gas company bonds have not fallen within the three highest rating groups; but, as to the investor's preference for electric utilities, I think it is fair to say that the electric utility industry is older than the natural gas industry. You state that you are not talking about the natural gas industry necessarily. If you are speaking of natural and artificial gas, it would appear to indicate that there was some preference for electric utilities and telephone utilities. Without a great deal of study I wouldn't like to answer your question
1575 as to whether or not electric and telephone utilities
are able to offer a higher rate or grade of securities than the gas distributing utilities. It might be there are many artificial gas company bonds which carry ratings of Aaa, Aa and A, but without having made any particular search I would not be able to say. They have not made this list, I will grant that.

Cross-Examination Interposed by Mr. Booth.

It is true that Sioux City Gas and Electric Company bonds are represented in that list. I stated that in many instances companies were not solely electric companies, but were engaged in electric and gas operations. In the Aaa list there are two companies that are engaged partially in gas operations, the Cincinnati Gas & Electric and Consolidated Gas, Electric Light & Power of Baltimore. Under the Aa rating there are two companies, the Louisville Gas & Electric and the Pacific Gas & Electric. I don't recall whether Consolidated Edison of New York is also engaged in gas operations. I don't know whether the financial standing of the Peoples Gas Light and Coke Co. may be partially affected by some of its financial dealings when Mr. Insull was in charge of the company, before he left in the late '20's or early '30's. Its bonds have a Baa rating. I understand that there was a connection with the Insull interest, but I haven't made a study of that particular situation.

Cross-Examination by Mr. Morgan Resumed.

The Commonwealth Edison Company was also connected with the Insull interests. Its bonds are in the Aa class. I have made no study of that Insull situation. The only difference, so far as their connection with Insull was concerned, between the two companies last mentioned in that Commonwealth Edison Company is an electric utility and Peoples Gas Light and Coke Co. is a gas utility. Mr. Booth's correction did not bring out anything that I had not already said. I stated some of these companies were distributing gas, but that they were predominately electric and telephone companies, with the one exception of the Peoples Gas Light and Coke Company which sells only gas.

In all of this mass of refunding that has been done in the past several years, I believe it is true that it was largely among telephone and electric utilities. I can't answer off-hand how many gas companies have refunded their indebtedness and taken advantage of this low rate that goes to higher class securities. I have not made a detailed study and would not answer definitely, but I would assume that there have been comparatively few.

The purpose of this refunding financing has been to obtain cheaper capital. It is a fair inference in the majority of instances that if they could have done so, the gas distributing companies would have gotten a cheaper interest rate by refunding. Of course, there are a great many considerations involved in refunding. Those same considerations, such as call prices, etc., obtain in the case of an electric or telephone bond.

The figures here deal also with bond yields to investors based on market prices, if we are discussing Chart No. 4, for example. In Schedule 7, pages 1 and 2, refer to the yield to the purchasers. That is not synonymous with the cost to the company, ordinarily. In the majority of
instances the cost to the company is more than the
1576 yield to the purchasers. In practically every in-
stance there would be the additional cost of financing in connection with their issuance. There is bound to be some expense, of course. In general, you have professional fees and underwriter's spread. The underwriter's spread varies considerably, from around two points to three points, depending upon the circumstances. Two points and up would be a fair statement of it. It might be as much as three. Two would possibly be the minimum. It all depends upon individual circumstances, but probably two per cent or thereabouts is customary. There is also the expense of printing and engraving and the payment of registration fees. By printing and engraving I refer to the printing and engraving of certificates, bonds and coupons. By certificates I mean the certificates of stock, or the securities themselves. There is also some preliminary printing to do. There are taxes and fees of one sort or another. The mortgage expense is also involved. I think that covers the field in general. I have said professional fees and services, printing and engraving. I think that covers the prospectus.

The professional fees cover legal services, accounting services and engineering services in general in preparing and presenting the prospectus and certificate of registration. Hearings before the Securities and Exchange Commission are involved. Also involved are engineering studies, geological studies, accounting studies and legal services in connection with natural gas companies. The geological study is special, but would apply to natural gas companies. I don't know just how many hearings would have to be had before the Securities and Exchange Commission. There is usually at least one. I assume there may be other hearings or informal appearances for all I know. I have not attended any of those. You are asking me something I can't answer definitely when you ask if these hearings are not held at Washington. I know that hearings are held at Washington, but whether all of them are held there I couldn't say. I don't know whether these hearings often extend over months. I would not like to make a general observation concerning the delay in the issuance of securities without more close connection with such matters.

I will grant that if there is a refunding operation and the bonds are printed and registered, the interest starts then ordinarily. The bonds that are to be refunded are also drawing interest until they are paid off. There is sometimes a double interest period in there. If the debt to be refunded carries a provision that the bonds can only be called by the payment of a premium, which is not an uncommon situation, that premium is generally considered a part of the cost of capital obtained in the refunding operation. You ask if all of these elements which have been mentioned here, when added together, often increase the cost of money over the yield to investors in per cent of the yield. I hesitate to say—to use the word "substantial". My recollection is, from reference to the study by the Federal Communications Commission, that, in general, on your bonds you could add approximately two-tenths of one per cent to the yield to purchasers to arrive at the cost to the company. That is the average situation. There may be instances when the cost greatly exceeds that, depending upon the company, the type of security, the type of debt, etc. I have agreed about the danger of using averages. We have to look behind averages.

1577 Schedule No. 8 shows the yield to purchasers of electric utility bonds sold in the period January 1 to August 31, 1939. That is the same study as that reflected by Schedule No. 7, except that it brings it on down through August 31, 1939.

Schedule No. 9 shows the cost of money and yield to the public of electric utility preferred stock sold in 1935, '6, '7, and '8. I don't know exactly what proportion of that preferred stock financing was refunding as opposed to new issues. It was largely refunding. This is brought on down in Schedule 10 to include the month of August, 1939. The issues are arranged alphabetically there. It does not show the cost to the company. It shows only the yield. The average shown here in Schedules 7, 8, 9 and 10 are weighted averages.

On page 7874 I stated in substance that the rapid decline in the price of new capital, particularly noticeable since 1934, suggested that the decline could be attributed not only to the course of the bond market itself but also to the quality of the offering. I was talking about bond yields and not the price of new capital on an overall basis.

Chart No. 7 has to do with wholesale commodity price indexes. It deals with the prices of farm products, foods, building materials, chemicals and drugs, fuel and lighting materials, hides and leather products, house furnishing goods, metal and metal products, textile products and miscellaneous. It is divided into the classifications of finished products, raw materials, and the composite of products. Although the classification semi-manufactured material is not shown on this chart, there is another such classification. These curves represent prices of raw materials, finished products, and all commodities. My figures indicate that the average monthly price for finished products index is 81.5 for the year 1938 and the first six months of 1939, and 79.8 for the last half of 1930 and the year 1931. In my judgment this chart has relevance to the subject of this inquiry, namely, the proper rate of return for defendants, in the sense that it is a part of a picture of economic conditions. Among the elements I mentioned to be considered in the subject of rate of return was that of general economic conditions. I think wholesale prices are indicative of general economic conditions. I didn't put in here the gross volume of commodities sold at wholesale because I think that it is impossible to cover every conceivable line of inquiry that might be indicated by any one of these charts. The answer is simply that we took indices that were representative. A comparison of the volume of commodities sold at wholesale, stated in terms of dollars, might be at least as good an index to economic conditions as a schedule of prices of commodities at wholesale. I am not denying that at all. I am just saying that this is what we have selected, and for the purpose we believe it is sufficient.

The two principal items of cost in connection with the operation of a natural gas pipeline other than the purchase of gas are materials for maintenance and labor. (Objection by Counsel for Illinois Commerce Commission overruled.) In dealing with the subject of commodities I have shown the price of commodities at wholesale. It is true that over in my next chart, No. 8, I deal with employment and payrolls, not on a price basis, but on a volume basis.

Employment is based on number of employees, and 1578 payrolls on dollars of payrolls expressed in the form of an index. The production, as shown on that same chart, has to do with the volume of goods produced. I mean it is volume in the sense of amount of production, but certainly not the addition of several units of quantity.

There have been changes in the wholesale commodity prices since the middle of 1939. I can give you some later figures. Schedule No. 11, page 1, price for July, 75.4; August, 75; September, 79.1. I have to skip October, although I have weekly prices for the week ending November 4, which is 79.3, and the week ending November 11, which is likewise 79.3.

Referring to Schedule No. 11, page 2, for July 67.8; August, 66.6; September 72.6; skipping again to the week ending November 4, 72.3, and the week ending November 11, 72.5.

Passing to page 3 the figures are: July, 79.2; August, 79.1; September, 81.9; skipping October; week ending November 4, 82.6 week ending November 11, 82.7. I think I may be able to give you some weekly prices in October for the last three weeks if you think that would be of assistance.

My revision of Chart No. 8, which is Exhibit No. 191, shows there has been a very sharp upward rise in industrial production between August and September. There have been rises during September in both employment and payrolls. Chart No. 8 portrays the number of factory employees. I would say that it represents an index of wage earners and not employment hours. It is an index of the number of employees. I have no data that indicates the comparative number of man hours to use for a curve indicating the man hours of work. You ask which I think would be the better index of the economic conditions, the number of hours work performed or the number of men who are employed. I believe from my studies in this connection that some discrimination was used in regard to accepting the number of employees as such. I mean, I believe that some consideration was given to length of employment period involved, and so forth. In other words, an employee who worked one hour in one day I don't believe would be included in this index to the same extent that an employee who worked the full day would be included. Some adjustment was made for that in my opinion. That is my impression but I would be glad to verify it and let you know what my findings disclosed.

As to whether this is a true index of the number of men employed, in the light of my last statement, that depends upon what you mean by true. I shall have to look into that matter and give you my finding. That is all I can say at this time.

If it be assumed that 100,000 units of some commodity are produced through the employment of 100 men for a week, each working, in order to get the work done, 40 hours a week, that would be 4,000 hours of work. I think there would be a difference in the economic situation if you put 200 men on the job and let them work half as long, because each man would be getting a smaller amount of pay.

I am willing to rest on the judgment and discretion of the United States Bureau of Labor Statistics as to the 1579 validity of the methods employed by them in setting forth what they believe is a fair and accurate employment index. The objective of that index, it must be assumed, is simply that of affording information for the knowledge of the citizens of the country. I don't believe you would have to know what the Department of Labor had in mind when they made the curve, unless you know what enters into the curve, before using it as a guide to economic conditions. I believe the curve speaks for itself; and I believe when we are presented with figures by a government source which gives them the appearance of representing economic conditions, I think we can accept those indexes without question.

Questions by the Examiner.

I have a bulletin with me issued by the Department of Labor, which accompanied the publication of this chart, describing just what they were doing or what they had in mind. The name of the bulletin is "Employment and Payrolls", and these bulletins are issued monthly. This bulletin belongs to our library.

Cross-Examination by Mr. Morgan Resumed.

You ask whether Exhibit No. 191, which is a revision of my Chart No. 8, indicates whether the economic conditions are better or worse at the present time than in the year 1925. It is assumed that the persons attempting to read these charts would have some acquaintance with business in general, and these figures have not been adjusted for a long-term trend. You would have to keep that in mind in interpreting the chart. It is common knowledge that when you use an index as of any year, you have to look behind statistics and see what it is. You want me to state what the chart indicates as to the comparison between the economic conditions of 1939, at the time these curves terminate, and the year 1925. I think that the common sense approach to this matter is essential; and I think that the chart manifestly shows that from 1925 to 1929 there was an increase in employment; and even though you do not have your long-term trend shown, I think the figures still serve to indicate what has been happening here in the past fifteen or twenty years.

It is not true that my appraisal of this chart would be to say that it indicates that economic conditions are better in 1939 than they were in 1925. I do think that a study of this chart, together with all the other charts in this section, would serve to indicate economic trends. I do not know that you can get away from the fact that the entire range of elements here points to the fact that economic conditions have to be considered, general conditions affecting all business should be considered, enlightened judgment must be used in each case. This would form the basis of enlightened judgment. The proper rate of return is a flexible concept and would naturally be so, because of changes in economic and financial conditions. All the way through you have that same relationship of the exhibits to the principles involved. I think it is implicit in the elements I have mentioned, that rate of return is dependent upon economic conditions except as they assert themselves in the cost of money.

In Chart No. 9 I am dealing with carloadings, steel ingot production, and building contracts awarded. I believe that refers to the number of cars loaded and there is an index based on that. There are other indices of carloadings which are based upon the number of cars, and while the

source in this instance is "The Annalist", I do not
1580 recall whether "The Annalist" mentioned the basis, but we would naturally assume that we were talking about the number of cars. As to whether the steel ingot production figures refer to tons or ingots, I think it makes no difference particularly. Whether I have that information here is another thing.

In the case of building contracts awarded, Standard Statistics publishes this information and it does not state in so many words the basis for it. We have here an index which is published by a responsible statistical organization for the purpose of being used as an index of economic conditions and that is why it is used here.

You ask whether these curves have more than a very remote relation to the subject of this inquiry. I think the same applies in the case of every one of these charts and schedules. They are an attempt to present background of economic information which indicates trends and to that extent they are valuable.

You ask whether or not there were thousand of carloads of scrap iron gathered up in this country, carried by rail to ports and loaded up on ships for Japan and Italy and other countries and carried away during the years 1936 and 1937. (Objection by Commission Counsel overruled.) I cannot say that was limited to the years mentioned there. In any case carloadings is another separate index, from which you could not impute the entire course of economic trends. You ask whether the fact that carloadings jumped up as a result of that activity could make any possible difference in the economic situation except as to those who had scrap iron. Inasmuch as the figures concern economic conditions in general, they are pertinent in the inquiry on the subject of rate of return. Among the things involved would be the number of people employed in loading the cars and unloading them, the traffic provided for the railroads and that afforded the ship owners, people employed in loading the ships and so on. Transactions relative thereto would be involved as well. You ask how these things have anything to do with arriving at a proper rate of return for defendants. So far as economic conditions are to be taken into account and general conditions affecting all business are to be taken into consideration, these are indices which give a background of economic information and, as such, they have pertinence in connection with the rate of return. In other words, you do not determine the rate of return for defendants by an economic vacuum. You try to reach out and get a picture of what is taking place and what has taken place and what may be likely to take place.

Naturally it is true that conditions of various industries will not all reach a peak at the same time. Nevertheless, it would be wrong to leave out steel ingot production just because it shows a drop in 1937 as compared with a rise in building contracts awarded. I think it can be said, of course, that both steel ingot production and building contracts awarded dropped toward the latter part of 1937, the difference being that steel ingot production dropped from a higher level; but since that time the pattern of the trend has not been so very inconsistent. The steel ingot production indicates trends in the steel industry; and I think it is a commonly known fact that when the steel industry is in a bad way the rest of the country suffers; and when the rest of the country comes back the steel industry comes back with it.

I think the rate of return for pipeline companies, that is, a determination of it, requires the exercise of
1581 enlightenment judgment, and that judgment has to
be founded upon economic and financial facts. You ask when the exercise of enlightened judgment would require an increase or decrease in the rate of return, when the steel ingot business is going down or when it is going up. (Objection by Commission Counsel overruled.) The steel ingot index is an isolated phenomenon of economic conditions. As I have just stated, in considering a proper rate of return you have to take into consideration all facts available that are indices of economic and financial conditions.

You ask why I didn't bring in a curve showing the status of the cattle industry and whether or not such an index would be just as pertinent as the steel ingot curve. It would be. If I had put that in it would probably have been just as pertinent; but you cannot put all the wealth of indices in existence into a chart if you can find some which appear to reveal trends as they occur. I would be inclined to feel that a curve showing the production of cattle in this country would show the same trends as the steel ingot production curve to a certain extent. I am inclined to feel that that might be a possibility. They might be the same, but without making an examination I could not say they are the same.

You ask whether or not, if such indices are the same, defendants should be entitled to more money or less money in 1939 than they were in 1931. (Objections by counsel to the two commissions overruled.) I am still of the opinion that you cannot isolate any one of these indexes and expect it to represent in and by itself the course of economic trends. I said the steel ingot industry index was one of the indexes. You ask whether a higher or lower rate of return should be allowed a natural gas pipeline company when economic conditions are bad generally than when they are good. There would have to be a great many facts known to make such a decision. You have got to see how the changes in economic conditions have affected the operations of the pipeline as to the cost of rendering the service, or producing and selling the commodity, or financing its operations, and those other elements I have said are proper to be considered in arriving at a proper rate of return. You also have to find out what has happened to the consumer. You ask whether I mean to say that the date of return should be reduced because the consumer may find it less convenient to pay. I mean that if, because of poor economic conditions, the revenues of a public utility are decreased and some attempt is made to increase rates, which the consumer is not in a position to pay, that the utility has got to suffer along with the rest of the business in the country. I mean the public has a stake in this besides the utility.

You ask what Chart No. 10 has to do with the proper rate of return for defendants. I think my answer to the last question is pertinent in this connection as well as the fact that here again we have another indication of economic conditions. You ask how I am to apply the difference in economic conditions reflected in Chart No. 10 in arriving at a proper rate of return for defendants. I have not arrived at any such determination, but, nevertheless, this chart certainly indicates something about economic conditions, as well as do the other charts in this section, and, therefore, I would say that it would have to be taken into account in determining a proper rate of return.

This index indicates that the national cash income is higher today than it was when the pipeline was put into operation in 1931. I don't think you could judge from one set of facts and draw any conclusions that ought to be derived from a great many sets of facts. The use to which the Examiner and the Commission would put 1582 this chart would be to inform them of economic conditions in general, so that whatever action they took would be taken in the light of known facts about economic conditions. This chart indicates that there has been, since the end of 1933, an over-all and substantial increase in the compensation of employees in this country. I am speaking here of cash income. You ask how that affects the operations of defendants. Increased wages might have the effect of increasing operating expenses of natural gas companies. It is a reasonably fair conclusion to state that it would indicate a trend in the direction of increased cost of labor, although it might not affect that particular industry. There might not be an increase in wages in that particular industry. As a general thing there is a competition in labor among all industries. I don't think there could be a substantial increase in wage scales without an increase in the wage scales of the natural gas pipeline business. I think an increase would eventually get around to the natural gas companies.

You ask whether or not I think it would be more helpful in arriving at a proper rate of return if I had dealt with wage scales rather than the aggregate compensation of men employed and the payrolls, as I have done with these exhibits. It might be that any kind of additional information would be helpful but we have just a limited space to compile significant indexes.

When I was dealing with wholesale commodities I gave the index prices. The trend of prices was reflected by the curves I brought in here. You ask if there is anything of the kind in here when we get over to labor. No, I don't see anything here pertaining exclusively to the natural gas industry. I don't know that I can agree with you that since the Commission must look to the future in determining a proper rate base, that it will be aided more in arriving at a proper rate of return if it has the trend of wage scales rather than the trend of payrolls; because if the labor cost is higher, it goes into operations and the rate of return is based upon a value which is over and above operating expenses. Of course, the operating expenses go on and on after the rate case is over. You ask whether a definite trend upward in the cost of labor per hour of a man's time is something that enters into the consideration of a proper rate of return. (Objection by Commission Counsel overruled.) I might say that not being an engineer I might not be as fully acquainted as I should like to be with the various kinds of employees engaged in the operation of natural gas pipeline companies; and just what wage scales, if I had them before me, that I could select, I don't know. I have, as a portion of this exhibit, an indication of the trend of wage scales. I believe I may refer you to Schedule No. 23. You ask where in that Schedule No. 23 are the wage scales indicated. In the column under the heading "United States." That gives you the picture for the country as a whole.

(November 29, 1939.)

Chart No. 10 covers all of the national income including income from direct relief, veterans' payments and payments under the Social Security Act. It is intended to portray the amount of income flowing into the hands of individuals and does not include so-called business savings or savings passed into surplus. That chart was introduced as bearing upon the general economic condition.

It reflects the fact that we had a depression which
1583 reached its depth in about 1933, that we had 1929
as the peak year in that period, and that since 1933 we have had a slowly but gradually rising trend through 1937, which was the best year since 1929, and that during 1938 there was some recession from which the country appears to be recovering in the year 1939. You ask whether that sort of situation, portrayed by this chart, points to lower or higher rates of return as proper in 1939 as compared with 1932. The opinion would have to be based upon all other available facts and not upon the information shown in one of these charts. You have to consider this chart in relation to other facts, both economic and financial, and it is very difficult to express an opinion based on what that opinion would be as far as this chart carries it. If you are weighing a commodity you put the commodity on one side of the scale and something on the other side in order to determine the weight. You want to know whether in weighing this element it points to a higher or lower rate of return for natural gas

companies in 1939 than in 1932. I think there are times when economic conditions are controlling factors in determining a proper rate of return and times when financial factors may be controlling. It isn't that I don't want to answer the question. If Chart 10 shows certain facts you must remember that is one side, one element of a situation. For that reason it is not reasonable to assume that every other element in an economic situation would be the exact opposite of this. Therefore, you couldn't make a decision depending upon this alone. I mean you can't limit a conclusion to studying one single set of facts in any situation.

You ask me what this chart has to do with a proper rate of return unless I can say it points to a higher or a lower rate of return. I haven't arrived at a rate of return in this case. I form no judgment on that point. I form no opinion on the subject and I haven't attempted to weigh the various elements, and this information has been submitted because it deals with economic conditions in general, and as a part of economic conditions in general it is pertinent to a discussion of rate of return. All of these charts were expected to be of some use. I brought this in as one of the total number of exhibits.

This information shown in Chart 10, taken together with all of the information appearing in Exhibit 185, is presented as a means and background of general economic information from which it is desirable to obtain knowledge of conditions upon which a fair and proper determination of a rate of return could be made. You ask whether I am referring in that observation to my statement yesterday, that when times get hard the regulated concern ought to take some of the losses. I don't recall my exact phraseology in the statement yesterday but I believe I said "regulated concerns." I believe I made the statement to the effect regulated concerns can't be expected to stand apart and not share in any of the losses occasioned by or incurred by business as a result of poor depressed economic conditions. You ask whether I think that when times get good they should be permitted to earn more money. I don't think they should be able to earn speculative profits. I think at all times they should be allowed to earn a fair proper rate of return, in good times and bad times. I don't like to tie my answer down to the statement that the proper rate of return depends upon the cost of money and these other nine elements that I read into the record. I would rather state it in my own way, that a fair rate of return depends upon the consideration of all facts, both financial and economic, in order to come to a conclusion.

1584 I would say that the sum total of all of the charts, tabulations and schedules included in Exhibit 185 point to better conditions in 1939 than those existing in 1933. You ask whether that points to a higher or lower rate of return than in 1933. My answer is that it points to a fair rate of return if it points to anything. I don't know what you mean by the statement that that is the most I can make out of it, but a fair rate of return is a fair rate of return. It might be a different amount or different percentage, but, nevertheless, it is a fixed concept; and that fixed concept does not change even though economic and financial conditions do change.

Questions by the Examiner.

The data carried into Chart No. 10 was compiled by the United States Department of Commerce and published in the Survey of Current Business. That publication does not in the monthly issues prepare charts, although occasionally in the introductory sense, when a new series is being introduced, they may submit a chart giving a picture graphically of the statistics. The Survey of Current Business comments on these charts. I can refer you to the comments on it if you would like to have them. I have here one issue for the month of November, I believe.

Redirect Examination Interposed by Mr. Slaff.

The Survey of Current Business is prepared by the Department of Commerce for the use of other people, regulatory bodies and other people who have use for it.

Questions by the Examiner.

The broad heading, "Business Indexes", and the heading under that, "Income Payments", appearing on page 19 of the November issue of the Survey of Current Business, are the payments that I used in my chart. We have a caption on page 19 called "Monthly Business Statistics", in large letters, and that covers the entire series of statistical data published in this magazine. "Business Indexes" would appear to apply to income payments, industrial production, agricultural marketings, world stocks; and there is another caption following that called "Commodity Prices", and another following that "Construction—Real Estate". So it would appear only those four are included directly under that heading "Business Indexes". Whether that should be considered a limiting factor is something I doubt very seriously, because it may be just an attempt to find a convenient terminology for a few indexes which did not fall under any other general caption. The fundamental purpose of these indexes is to enable business men to become thoroughly informed on business trends in general and financial trends. Yes, it always comes back to price insofar as price reflects changes in economic conditions.

Cross-Examination by Mr. Morgan Resumed.

You ask in which direction Chart No. 10 points whether to better economic conditions or not. The chart would appear to indicate that in 1939 conditions are better than they were in 1932 or 1933. You suggest there is
1585 nothing, then, from this chart that would make it necessary to apply the observations I made yesterday that when times are difficult or economic conditions are bad, the regulated company should take its part of the losses. I think that was a fair statement in and by itself. If you are asking whether we are talking about comparing economic conditions today, my answer would be that I have made no such implication.

Entrepreneurial income, as that term is used in this chart, is the income of small business enterprises, not incorporated—proprietorships, farmers. It refers to unincorporated proprietorships as opposed to those who are loaning money, collecting interest, or who own stock and get dividends. It is not entrepreneurial income in the sense that that term has been used here in the record as compensation for enterprise over and above risk premiums.

Chart No. 11 has to do with the natural income and cost of living in terms, first, of the income stated as dollars in the lower curve. The upper curve, "National Income Payments at 1929 Prices", represents the purchasing power of the income in dollars as compared with 1929. The chart indicates that nearly as much goods can be bought with the present income as could be purchased in 1929 with the income of that year. We are speaking about purchasing power in general. It means that if you have $10 you can buy nearly as much goods with it as in 1929. That would indicate that your income is not at the 1929 level; it has not reached that level yet; but in terms of purchasing power it is almost equal to the 1929 income. I am talking about the national income as shown in Chart 10. As a matter of fact, the lower curve of Chart 11 is based on such national income as shown in Chart 10.

The general interpretation of the words "purchasing power" is that all of the income in the country in 1939 would buy slightly less goods than all of the income in 1929. The cost of living curve has to do with the change in price level of certain commodities which I have enumerated. I enumerated the commodities which go into that cost of living curve at the top of page 7903. It was made up of foods, 33 per cent; housing, 20; clothing, 12; fuel and light, 5; sundries, 30. Fuel and light is 5 per cent of the total. I don't know how much of that is for electricity and how much is for coal or wood. I can't give you the details on that. The breakdown of the fuel and light may or may not be available to the public, but that 5 per cent does include electricity, gas, coal, oil, kerosene, distillate, wood, and we might extend the list of fuels, I suppose. I would not have the slightest idea of what percent of that total 5 per cent is represented by the cost of gas.

Chart 12 is based on "Standard Trade and Securities", published by Standard Statistics Company, and represents, according to the legends, the corporate earnings of 15 utilities, 120 industrials and all classes of railroads. There is no curve on that chart indicating the course of earnings of gas companies.

1586 The 15 public utilities listed on Chart No. 12 are:

- American Light & Traction,
- American Telephone & Telegraph,
- Columbia Gas & Electric,
- Commonwealth Edison,
- Consolidated Gas, Electric Light and Power of Baltimore,
- Detroit Edison,
- International Tel. & Tel.,

New England Telephone & Telegraph Company,
Niagara-Hudson,
Pacific Telephone & Telegraph Company,
Peoples Gas Light & Coke Company,
Public Service Company of Northern Illinois,
Public Service of New Jersey,
Twin City Rapid Transit, and
Western Union.

Peoples Gas Light & Coke Company is the only company that is confined to the gas business. It is a distributor of mixed gas. There are one or two others which handle both gas and electricity, including Columbia Gas and Electric. There are five telephone and telegraph companies included. Four companies, namely, Columbia Gas & Electric which I have already mentioned, Consolidated Gas, Electric Light and Power of Baltimore, Public Service Company of Northern Illinois, and Public Service of New Jersey, handle gas as well as electricity. So far as I am aware, the Columbia Gas & Electric group is the only one which has natural gas transportation and transmission facilities.

The term "corporate earnings" means the net earnings before dividends. My understanding is that that means net income before dividends. It is the revenue that is available for dividends.

The upper curve which I have identified as utilities does not have anything to do with the rate of earnings as compared with the capitalization. It is, as I have just stated, net income available for dividends. The net income available for dividends is stated in terms of dollars and not in percentage of the total capitalization. I show, however, in Chart No. 13 the relation of net profits to total invested capital for 21 leading utility corporations. Undoubtedly the earnings of these companies, if they are holding companies, are stated on a consolidated basis, so that the earnings would reflect operations of the system rather than of the holding company by itself. You asked how many of these companies are holding companies. I want to point out that that might not have any relationship to the curve. I believe Columbia Gas & Electric, International Tel. and Tel., Niagara-Hudson, Public Service of New Jersey, and probably American Light & Traction, are holding companies. I did not list A. T. & T. because you asked only for pure holding companies. It operates long lines.

I do not know what proportion of Columbia's total capital investment is represented by pipeline facilities. I have not the figurse showing the total proportion of that company's income from its transmission lines and production. My impression is that it has very extensive distribution facilities both in the gas field and in the electric field. I assume they own some street railway facilities and other holdings besides their gas holdings. I have made no special study of that company, but that is my impression.

I do not happen to have the figure in mind as to the proportion of the total income available for dividends of Public Service Corporation of New Jersey represented by revenues from gas distribution. I would be glad to
1587 find out some of those things for you. It is my under-
standing that company is predominately an electric distribution system. I believe that that is true of all of these other companies that deal both in gas and electricity; that they are predominantly electric distribution systems.

I don't think I have said this chart indicates anything with reference to the public's attitude toward risk. I mentioned that it was connected with the subject of investor attitude regarding risk. This chart shows that as compared with industrial and railroad companies, there have been fewer marked fluctuations as extreme as those which you will find in industry and railroad corporation earnings. That would help with reference to defendants in the sense that it shows that regulated companies in this group show fairly stable earning levels. In good times they don't rise to excessive heights, and in bad times they don't drop to excessive lows. That observation I think would be indicative of the industry. I certainly feel that Standard Statistics could fairly be relied upon to present in a chart what it considers to be the best available information indicative of the utility industry.

By "utilities" I mean electric, telephone, telegraph, water, gas—and by gas I mean natural gas and artificial gas and companies engaged in its transportation whether or not they are subject to regulatory authority. Maybe one or two others could be thought of. I include in the category of utilities, in making that observation that their earnings are more stable, the gas business. The upper curve there may or may not be an index of the course that earnings available for dividends in the gas business would take. I don't think it is intended to be specifically an indication of that sort. It is a general indication of utility earnings. The utilities have been selected by Standard Statistics, published with the caption " 'Public Utilities', Not Qualified," and for that reason is no more specific than the term "Public Utilities" specifically.

Questions by the Examiner.

Standard Statistics has bond ratings the same as Poor's and Moody's do. I do not happen to have the Standard's ratings on these bonds. I think Standard Statistics would have the same standards of rating as the others.

Cross-Examination by Mr. Morgan Resumed.

You ask whether I have made any comparison of the source of the incomes available for dividends among the gas distribution companies. I believe there are figures for natural gas distribution companies in Exhibit 186. To my knowledge, the figures for artificial and mixed gas distribution companies have not been put into the record as such. I know that more than 90 per cent of all the gas that defendants transport and sell goes to those who distribute mixed gas. I recall Mr. Smith's statement on his preliminary cross, that the figures shown in his Exhibit 186 do not include the figures for those who purchase more than ninety per cent of your gas, namely, those who distribute artificial and mixed gas.

The gas companies, of course, would be more related physically to the natural gas pipeline companies than would the telegraph or telephone companies. I think the physical relation is the primary way in which artificial and mixed gas companies are related to the natural gas pipelines. I was thinking in my answer of the attitude of investors. I may have gotten astray from the direct purpose of your question. I don't deny that there is a close financial dependence and relationship resulting from this corporate set-up.

1588 Much would depend upon the nature of the underlying contracts as to whether the natural gas pipeline company which must look to the distributor of mixed gas for its outlet is dependent upon the ups and downs of the distributors who purchase that gas. If you mean the extent that the distributing company goes into bankruptcy or something like that, it would have an effect. If the distributor's market falls off, the volume of gas which the pipeline can sell is directly affected, if there is a provision in the contract covering such a contingency. I am referring to the contract that I mentioned in a general way. I was saying that if there were a contract for the distribution and purchase of this gas that had fixed terms, the dependency would not be so acute unless provision were made in that contract. If that contract only covered a portion of the total valume, then there would be an absolute dependency except insofar as some demand charge or other was concerned. I am not very familiar with the demand charge that is involved in the contract of defendants. I have read something about it, but I mean I wouldn't be prepared to testify about the contracts.

My information as to the revenues of defendants doesn't go beyond the year 1937. If there was a falling off in 1938 and a pick-up in 1939, such circumstances would appear to indicate a direct dependency of the pipeline company upon the vicissitudes of the distributing company for its outlet.

Questions Interposed by the Trial Examiner.

In connection with Chart No. 10, the question directed to me asked in which direction the chart indicated; whether toward better or worse conditions. I believe that is the substance of the question. I answered that I did not understand that question; and my reason for saying that was because I could not tell whether the question related to a better direction in connection with rate of return or in connection with economic conditions. I would have to have that point straightened out before I could proceed to answer.

Cross-Examination by Mr. Morgan Resumed.

I am aware that such bulletins as Statistical Bulletin No. 36, entitled "Annual Statistics of the Manufactured Gas Industry in 1938," by Paul Ryan, Chief Statistician, are published; I am not familiar with that particular document. I have never had occasion to examine Exhibit 179. I seem to recall that such a bulletin was offered in evidence. This bulletin No. 36, about which you asked me, is of the same general character as Exhibit 179, except that it applies to the manufactured gas industry, as I understand it.

(At this point Counsel for defendants produced the document entitled, "Annual Statistics of the Manufactured Gas Industry in 1938, Statistical Bulletin No. 36, October, 1939, Paul Ryan, Chief Statistician" with the request that it be marked as an Exhibit. At the direction of the Examiner, the document was marked Exhibit No. 194 for identification.)

In the foreword on the first page inside the cover of Exhibit No. 194, in the second paragraph from the bottom, it is stated: "Companies selling mixed manufactured and natural gas are included in these data." On page 14, in table 6, are found the figures from the years 1929 to 1938, inclusive, showing the net income available for dividends and surplus in the manufactured gas industry in the U. S. In the light of the foreword, that would include those com-
panies which are distributing mixed gas. That is the
1589 same sort of figure that is reflected in my Chart No.
12 where I am dealing with the net income available
for dividends and surplus. The total amount of net income available for dividends and surplus in the years 1929 to 1938 inclusive are:

1929	$82,204,000
1930	83,119,000
1931	82,342,000
1932	68,332,000
1933	49,136,000
1934	35,280,000
1935	23,769,000
1936	25,314,000
1937	23,858,000
1938	23,030,000

You ask whether those figures indicate that the net income available for dividends and surplus of manufactured and mixed gas distribution companies was more comparable to the 15 utilities whose net income are reflected in the upper curve or some of the other curves on Chart 12 of Exhibit 185. I can't make an exact relationship here, because these curves are constructed on the basis of quarterly averages, not on annual averages. Oh, yes, on the basis that I have outlined, the chart indicates where they wind up at the end of the year.

The index number at which the utilities curve on Chart No. 12 stood at the end of the year 1929 was 142 or 143 based on 1926 as equal to 100.

(At this point, counsel for defendants produced a document described as photostat of Chart No. 12 with a broken line curve superimposed on it, with the request that it be marked as an exhibit. At the direction of the Examiner, the document was marked Exhibit 195 for identification.)

I have checked the figures on the second page of Exhibit 195, which you have just handed me, and find they are the same figures in the middle column as the figures which I read into the record from Exhibit 194. Taking the location of my 15 utility companies shown on Chart No. 12 of Exhibit 185 which appears to be 142½ at the end of 1929 as the beginning point or index number for the figures reflected in the middle column of Exhibit 195, I have traced along the broken line moving immediately to the right from that point, the course of that line, to see whether or not it reflects correctly the course of the curve as fixed by the figures in the middle column on the second page of Exhibit 195 and find that they seem to follow the computed indexes shown on the page attached to the chart. The course of the curve is different from the course of the curve indicating the net income available for dividends and surplus of the 15 utilities shown on the upper curve of my original chart 12 and winds up about 40, as compared with approximately 107 for my utilities curve.

(EXHIBITS NO. 194 and NO. 195 were offered and received in evidence without objection.)

Redirect Examination Interposed by Mr. Slaff.

For the year 1931, the index for the 15 utilities shown on Chart No. 12 would be 123 based on 1926 as equal to 100. The exact figure is 123.5 according to schedule 16, 1590 page 3. For the year 1937, it would be approximately 125, which is substantially on a par with 1931. So if we were using 1931 as 100 index, the 1937 figure would also be 100, approximately, as far as earnings available for dividends are concerned.

Referring to Exhibit 186, Schedule 2, which shows earnings available for dividends and surplus for the natural gas industry in the U. S. for the years 1931 to 1937, it appears that the net income available for dividends and surplus in 1931 was $50,816,000, in 1937 the figure was $74,623,000, so there was an increase during the period very close to 50 per cent. If I were using 1931 as an index of 100, the index for 1937 would be approximately 150.

Cross-Examination by Mr. Morgan Resumed.

Of course the figures supporting the net income are contained in the Exhibit to which I was referring. I see that in 1931 the total operating revenues of these companies was $368,000,000 and in 1937 nearly $447,000,000. Operating expenses and other revenue deductions increased from $284,000,000 in 1931 to $335,000,000 in 1937. Those would be the principal factors which account for the change in the net income available for dividends and surplus between the two years.

Redirect Examination Interposed by Mr. Slaff.

The source of the data there shown is the same, or comes from the companion statistical bulletin, issued by the American Gas Association dealing with the natural gas industry, as the one which Mr. Morgan put in evidence as Exhibit 194 on which he examined me previously.

Cross-Examination by Mr. Morgan Resumed.

In view of the note at the bottom of Schedule 2 of Exhibit 186, it is indicated that companies selling mixed manufactured and natural gas are not included in these data and distribution companies to which defendants sell gas are not included in the figures I have just read at the suggestion of Mr. Slaff.

You ask if the figures read into the record at the suggestion of Mr. Slaff are due to growth and not to increased earnings of the companies which were on an earnings basis in 1931. I cannot answer that question without studying these statistics a little further. It is my understanding that there has been a rapid growth in the volume of natural gas handled since 1931. It is in accordance with my impression that defendants were not operating in 1931, except in a preliminary way in the latter part of the year. I cannot say whether that was true as to Northern Natural and Panhandle Eastern. I do not know.

You ask if I can with any degree of safety compare the earnings of these pipeline companies in 1939, 1937, or 1938 with the earnings back at the time when they were not in operation. If they were not in operation in 1931, it would be necessary to pick up the first year in which they had full operation for the year. It might be possible that we would have to make allowances in using the figures for the natural gas industry for those facts, which are matters of common knowledge, that many of the great pipelines were built and put into operation at approximately that period; but I am not familiar enough with it. Your premise is correct I believe.

1591 Chart No. 13 is also based on studies by Standard Trade and Securities, published by the Standard Statistics Company, Incorporated. On page 2, schedule 17, it is stated that invested capital includes funded debt, preferred and common stock, capital reserves, and surplus. By "capital reserves" are meant contingency reserves. Undistributed profits would be included in surplus, I imagine. Capital reserves does not mean reserves for depreciation and things of that sort. By capital reserves is meant reserves appropriated out of surplus for special purposes, which may be returned again to surplus when the purposes have been met, if they have not been used by that time. I believe I have the figures showing the 12-year average from 1927 to 1938, inclusive, of the yields of the 21 utilities, 42 railroads, and 400 industries shown on Chart No. 13. For the 400 leading industrial corporations, the average for the period is 6.60 percent, for the 21 leading utility corporations, it is 5.9 percent, and for the 42 leading railroad corporations, it is 3.87 percent. Included in these averages are the depression years of course.

You ask whether in my view in appraising the yields from investments as an element entering into a proper rate of return in 1939 that years like 1931, 1932, and 1933 should be included in the 12-year average in this chart. I think if you are going to compare the three groups of corporations for this period, there is nothing unfair about using the average. It all depends on what is being ascertained. In other words, if you use an average for one group, you are entitled, in comparing that with another group, to use the same average for the other group.

You ask whether I think that those three years 1931, 1932, and 1933, which marked the depth of the depression in this country, should be used in calculating averages from 1927 forward. The investor that is going out today to make an investment, in my opinion, would look at conditions as they exist in order to determine what he would expect as a return on his investment, based on comparisons, and his expectations of current return, in other words, would not be based on a 12-year average, I don't think. It is possible that he would not be concerned with more than maybe one year, if at all. It depends after all upon the manner in which the investor studies the situation. You ask whether he would look only at 1938 or would take a glance at 1937 before he put his money in. It all depends on the investor. A true investor would probably either make a pretty detailed study of as much information as he could get hold of and digest, or turn his money over to or engage somebody to give him advice. He would demand today what he could get today. He could not demand any more. He could demand more, but he would not necessarily get it.

Yes, he could put his money in the bank and let it be loaned out at the interest rates I have portrayed in my chart here, or he could put it in government securities and refuse to put it into investments involving risks, unless he was compensated for his risks. You ask whether the indications are that he is not willing to put his money into investments on the earnings of today and the last few years. There are great quantities of idle resources to be sure; but the fact is, interest rates and yields on preferred stocks and so forth are not so high today. They are low enough to indicate that there is not a great demand for new capital at any rate. The fact that money rates in general are very low indicates that there is not a great demand for new capital.

1592 I don't know that you can say that people are running from risk. People are holding on to securities. Presumably there is a market for securities. It is not as though people are hoarding money. And it is true that people try to avoid risks in times of uncertainty. I don't believe that I said that people are unwilling to put their money to risks, because they are doing it. I have stated in my testimony in connection with this exhibit that there have been comparatively small transactions in common stocks. And I stated that as a reason why I did not include a common stock study in my exhibit 185. There was no demand for new capital.

You ask why there is no demand for new capital. Whether I explained it or not, I don't know; but the reason would be that business did not feel in a position to expand during the last few years. You ask whether it is unwilling to go into business for the compensation offered in relation to the risk involved. It may be that it would have been unwise to expand plants unless business could see a purpose for which they could be used. That is not a risk. That is common sense.

Questions Interposed by the Examiner.

You ask whether or not it is considered that there is a need for public utility construction which has not been made. There seems to be a division among the public utility men as far as I can gather from the press. I have read of plans involving the expenditure of $600,000,000 in 1940 for utility plant expansion. I haven't of my direct knowledge obtained facts which would lead me to a conclusion as to whether what I read is correct or not. I do not know of any public statistics that show the need of public utility construction, an accumulative need for public utility construction.

Cross-Examination by Mr. Morgan Resumed.

I have noted press comments; but whether I could lay my hands on them or not, I don't know. I mean just as part of the general information that you read as you go along from day to day. And furthermore, sometimes one figure you read will be different from another that you will see the next day; and it is pretty hard to form any conclusion from that sort of information.

I have read something about the release of the Federal Power Commission on the application of the Kansas Pipeline Company. I believe it is Order No. 39. I can't recall whether it was the release I saw or the order that I saw. I did read something about it. I don't remember having seen the statement in substance to the effect that a pipeline of that magnitude could not be financed by private capital and that witnesses on both sides had so testified. No, I do not recall that the release went on to say that the applicants would be given an opportunity to get a definite commitment from the R. F. C. and that the application would be held pending their efforts in that connection. My impression is that the application was left pending the receipt of a commitment for financing. What I was referring to was that the company, according to my understanding, failed to show that it had a commitment for financing. I don't know whether it has made that showing as yet.

1593. *Redirect Examination Interposed by Mr. Slaff.*

You ask if I know of any method by which the years 1930, 1931, and 1932 could be left out in computing a 12-year average. I do not. That 12-year average included those three years of the depth of the depression and also the so-called top of the boom period, 1927, 1928, and 1929.

Cross-Examination by Mr. Morgan Resumed.

It appears at page 8203 that you asked me this question: "The banks are full of money belonging to depositors who are not willing to invest it in the light of compensation promised for the risk involved. That is a matter of common knowledge in this country, isn't it, Mr. Knapp?" and I answered: "I believe that is a fair statement. That is a fair statement."

In Exhibit 185, Chart 14 is very similar to Chart 13, except that in Chart 14 the net profit is related to the total property accounts, less reserves, plus inventories. That is not the same kind of reserve that I was talking about a while ago when I was talking about capital reserve. The reserves referred to in Chart 14 are the depreciation or retirement reserves applicable to plant assets.

I don't think I would have any means of determining whether the level of depreciation rates or reserves had increased substantially. Of course, there is bound to be some normal increase, you understand, due to the fact of the passage of time. You asked whether or not in the past few years there has been a material change in the amount of annual reserves which are set up against depreciation and things of that character. I do not have a basis for answering that question. In my judgment, any changes in the proportionate amounts of the depreciation reserve to property accounts in the period covered by this chart would have no great effect. I did not mean to imply that the trends and directions of these curves would not vary materially if you were dealing with the property accounts without deducting the reserves.

The difference between the property accounts and the reserves—I am speaking on the mathematical difference—results from changes in both the property accounts and in the reserve accounts; and I think it is pretty difficult to say whether the net property account would be as fixed—

would follow as fixed a trend as the gross property account. You ask whether the annual allotments to reserves if left in the capital investment rather than deducted from it change materially the course of these curves insofar as their tendency or directions are concerned. Maybe not in the tendency, but I would have to get information from which I could make a definite answer. I cannot do it without making that study. I believe I could get the information from the Standard Statistics Trade and Securities, Volume III, Section J, and so forth, where they show a composite balance sheet from which these figures have been obtained. It is possible that they do show them less reserves. I had in mind the possibility that they might show the reserve separately.

I don't know that you can say a given company as a matter of common practice sets aside the same amount each year for accrued depreciation reserves. Sometimes a company will follow a consistent policy and sometimes it will not. We cannot answer that question without knowing the company and knowing its policy.

1594 You ask whether there was enough fluctuation in the percentages of the total capital investment set aside for a depreciation reserve from year to year to distort these figures. I don't see how they could distort it. We have got a base and we are relating net profit to a base, and the question of distortion does not arise.

Question Interposed by the Examiner.

Distortion is a common figure of speech and a relative one in statistics. In the sense that it was being used at the moment, I didn't think it should be used, because if you establish a base and relate something to the base, changing the base would not distort the curve. It would change the curve.

Cross-Examination by Mr. Morgan Resumed.

You ask if there is such fluctuation or variance in the practice of business in general, as it is reflected in this curve here, in the percentage of the total capital investment set aside to depreciation reserves or other kindred reserves as that the direction of these lines would be changed if I had used the gross property account instead of the property account less reserves. It is possible. I just don't know how the use of the gross property would affect these curves. The course of these curves is attributable in part to the change in depreciation amounts provided; it is due in part to changes in gross property conditions and retirements. It is due to changes in net profit. It is due in part to a great many things.

Those changes which occur from year to year in the gross property account would occur as certainly if we were using the gross property account as the basis of comparison as if we were using the gross property account less reserves, if the same information was used, of course. I do not know whether or not the fact that reserves are deducted each year in arriving at the basis of comparison between property account and net profits would change the direction of those curves through the period represented by the chart from what that direction would be had the gross property account been used.

Questions Interposed by the Examiner.

You ask if that graph would not be useless if companies by rearranging their depreciation policy changed the amount of the net profit. If all the companies made that change the year in which they made the change would not be strictly comparable to the previous year. I do not know whether Standard Statistics, or whatever the source of these figures are, would have made some comment about that unreliability. I do not know of any wholesale changing of depreciation policy of that type, if it has occurred.

Redirect Examination Interposed by Mr. Slaff.

If there were a change in depreciation reserves in the amounts added annually to depreciation reserves, there would be a compensating change in net profits, but whether it would compensate for the difference in percentage, I don't know.

Cross-Examination by Mr. Morgan Resumed.

You ask whether the figures shown in Exhibit 194, page 14, table 6, the last line of figures, "Utility Plant," are comparable to those used in the total property account in arriving at the curve shown on Chart 14. I doubt it very

much. I believe the figures shown in table 6 are gross utility plant. It is not so stated, but I believe that to be the case. I believe the figures under "Gross corporate income" are comparable to the figures used in arriving at my results reflected in Chart 14 as near as I could get to figures of net profit shown in Chart 14. If you divide
1595 the gross corporate income from year to year by the utility plant you are not getting a curve which is on the same level or same comparable level as the curves reflected in Chart No. 14. The level would be changed. If I were to restore to the figure "property accounts less reserve" the amount of the reserve, the curve shown in Chart 14 would be on a different level; but I don't know whether they would follow the same pattern or not. Inasmuch as there would be no change in the net profit figures as a result of this computation, it would appear that if you increase the base the per cent of net profit to invested capital will be reduced.

(At this point, counsel for defendants produced a document described as a photostat of Chart No. 14 with a heavy broken line curve superimposed thereon and requested that it be marked as an exhibit. At the direction of the Examiner, the document was marked Exhibit No. 196 for identification.)

I have Exhibit 196 before me. I see the legend there identifying that heavy broken line which is on this exhibit and which is not on Chart No. 14, of which this exhibit otherwise is a photostat.

1596 I have made a check of the curve identified as manufactured and mixed gas companies on Exhibit 196 and the figures supporting that curve on the following page with the figures shown on page 14 of Exhibit 194. There is a typographical error in stating the gross corporate income for 1930 and 1931. For 1930 it should read 123,473, and the following year it should read 127,304. I find the return ratio in the fourth column correct on the basis of figures shown in Exhibit 194. I find the tracing correctly locates the curve marked "Manufactured and Mixed Gas Companies" in Exhibit 196. This tracing shows a lower level in the percentage of the relation of net profits to the total of property accounts for manufactured and mixed gas companies during the period covered than is indicated for the relation of net profit to total property accounts less reserve plus inventories for twenty-one leading utility corporations. The relationship between the year 1929 and the year 1938 shows a difference in percentage of return ratio in the case of manufactured and mixed gas companies of between 6.76 per cent in 1929 and 3.43 per cent in 1938, or a decline of 3.33 per cent absolutely.

For the twenty-one utility corporations the relationship of net profit to total of property accounts less reserve plus inventories for the year 1929 was 7.6 and for the year 1938, 5.9, indicating a decline in percentage of 1.7 per cent absolutely. My results would indicate the decline for the twenty-one leading utility corporations, expressed as a percentage of 1929, of 22.4 per cent. The corresponding percentages of decline in the case of manufactured and mixed gas companies is 49.3 per cent.

(At this point counsel for defendants offered in evidence EXHIBIT 196.)

The manufactured and mixed gas figures shown in Exhibit 194 do not include inventories, I would assume, because the term and item "utility plant" shown in Table 6 is not qualified in any way. If it did include inventories, it would have to be qualified to be accurate, I think. If the item included inventories, as it is now shown, by removing inventories you would get a lower base and consequently a higher percentage. The fact that the figures which were used did not include inventories results in a higher percentage than if the inventories had been included in the base. To state it in my own words, if this figure does not include inventories, and you were to add inventories to it, the base would be increased and the per cent return would be lower than that shown in Chart 14 of Exhibit 196.

The figure for the twenty-one leading utility companies does include inventories. If I were to remove the inventories from the base in the calculations from which that curve resulted, it would raise the position of that curve on the chart because the base would be reduced, and if I were to remove reserves from the base for the manufactured and mixed gas companies, I would raise the position of that curve on the chart.

Questions Interposed by the Examiner.

The differential in absolute terms would be the same. In other words, when you take your reserves out and put your inventories in, all you are doing is shifting the vertical posi-

tion of the line; but I can't predict how much change will take place in the vertical position of the line. I know or believe it will change. Just how the reduction of the reserve would compensate for the addition of inventories, I don't know. There again, even though the annual retirement expense for the period of 1929 to 1938 is fairly consistent, but that in itself would not be an altogether complete basis for estimating changes in the reserve, because retirement may
or may not have equaled, that is, actual retirements
1597 charged against the reserves during that period may
or may not have equaled the provision.

(At this point the Examiner asked the witness W. C. Gilman, who had heretofore testified, questions through which he elicited the following information:

I assisted in the preparation of Exhibit 196. We tried to set it up with comparable data, but we just could not get from the American Gas Association, which is the only source we know of which compiles complete industry figures for the manufactured and mixed gas industry, the amount of the reserves for the industry at the end of each of those years. We made a check with respect to the question of whether the gross utility plant set forth in Exhibit 196 is with or without inventories, and were advised by the American Gas Association that the figures for "Utility Plant" in that exhibit do not include inventories. I made that check. The figure refers to gross utility plant account. I did not make any inquiry as to whether there was any separation of tangibles and intangibles.

Exhibit 196 was received in evidence over the objection of counsel for the Commission and for complainant, who were allowed an exception.)

Cross-Examination by Mr. Morgan Resumed.

I have no reason to change my position or to change the statement I made at page 7911 of the record while discussing Chart 15, in which I said: "I would like to refer again to previous testimony on bond yields as indicating that since 1921 public utilities have enjoyed, on the whole, about as favorable a market for their securities as other forms of enterprise; that since 1933 they have been able to obtain capital at lower costs than other enterprises, and that at least since 1935, in the case of newly issued electric utility bonds, they have been offered on the average at even more favorable terms than those obtained for public utility bonds as a class. Thus, the attitude of investors aids in confirming the favorable position of public utilities from the standpoint of comparative risk." I think I would be willing to rest upon that statement. As to whether it would be more accurate if I had said they have been able to obtain refunding capital represented by the highest grade of bonds, rather than to say that they have been able to obtain capital at a lower cost, I don't think there was anything which is not disclosed in my statement. I, of course, stated, "In the case of newly issued electric utility bonds, they have been offered on the average at even more favorable terms than those obtained from public utility bonds as a class." I can't find any reason to change that statement. I have already explained, I believe, in prior testimony just what I was talking about. I believe I had explained it at the time I made that statement in the record. I mentioned that the financial transactions were largely of the highest order of bonds. Whether or not I mentioned that it was largely refunding, I can't say offhand. I might have stated that.

I would like my answer, of course, to indicate the facts; and if any facts have been omitted in that statement, I would be glad to have your additional comments added to that statement. Yes, I want the answer read in the light of my testimony that it all had to do with refunding transactions and with the highest order of bonds for the most part. I wish to add that statement with reference to refunding. The fact that in the case of newly issued electric utility bonds they have been offered on the average at even more favorable terms than those obtained for public utility bonds as a class is due to the fact that the investing public regards that type of bond as more safe and freer of risk than public utility bonds as a class.

1598 In this section of Exhibit 185 some of the schedules, for example that on page 2 of Schedule 16 and page 4 of the same schedule, show the moving average of earnings as terminating on March 31, 1939. It takes some little time for that information to be published, possibly a month or two months, and that of course would be the explanation for my stopping those moving averages as of that date.

Since that time there have been published figures which would enable me to bring that on down to date. You ask what the tendency of the moving average of earnings since March 31, 1939, has been so far as disclosed by the published figures. It happens that the figures I have for page 2 of Schedule 16 are indicated as being estimates for industrial companies. I will give you those moving averages. For the year ended June 30, 1939, the average of the index, based on 1926 equals 100 per cent, is 60.5. For the year ended September 30, 1939, the average is 66.7. Those are higher than the moving earnings ratios have been since the year ending June 30, 1938.

Turning to page 4 of Schedule 16, for 15 utility companies the figures I have also appear to be estimates for the same two quarters; and on that basis the average for the year ended June 30, 1939, is 112.4 and for the year ended September 30, 116.5. There has been a progressive increase in the moving average in both these quarters.

Then turning to page 6 for the railroads, I appear to have the June 30 quarterly figure, which is not indicated as being estimated, so I would consider that as actual. Of course, prior figures were taken as actual. For the year ended June 30, 1939, the average for railroads was a red figure of 3.9. For the year ended September 30th, based on estimated earnings for the third quarter, it was a black figure of .8, so in a peculiar sort of way the moving average earnings of the railroads have been progressively upward since March 31. The deficit has been reduced. The red in June was not as large as it was in March, and they got into the black in September.

I would say that Chart 15 is another chart dealing largely with short-term interest rates. By rediscount rates of the Federal Reserve banks I mean rates which the Federal Reserve banks charged to member banks for making loans secured by eligible paper. You ask whether I know the facts as to the terms upon which the Federal Reserve banks will accept paper of a member bank. I note from Schedule 19 supporting this chart that the rates on all classes of paper from the beginning of 1922 to date would indicate to me that it was commercial paper that was involved in these rediscount operations. I don't have the information available as to what the terms are upon which the Federal Reserve banks will rediscount or what the requirements are to meet the rediscount rules of the Federal Reserve Bank. I do not believe the paper which they would rediscount would include capital loans. My impression in general is that it is confined to agricultural, industrial, and commercial paper. I can't give you the exact maximum maturity either; but it probably is not a very long maturity. It is probably less than a year. You ask if it isn't in fact 90 days. My memory may not be so good. I would prefer not

to answer specifically. My Schedule 19 shows that it used to be 60 to 90 days. That is what it used to be to the end of 1921. I have no positive figures as to the limit at the present time. You ask if I am clear that it does not include notes for the purpose of carrying on trade in stocks, bonds, and other securities, except bonds of the United States.
1599 My answer would be that the type of security is the same you have just mentioned: agricultural, commercial, and short-term paper. I don't believe that brokers' loans would be handled under such an arrangement as this.

These rediscount rates would have very little if any influence on the cost of capital to a natural gas pipeline company. Of course, a company might require some short-term funds in a period to tide it over, and it might affect it to that moderate extent.

I stated in my direct testimony that one of the deductions you make from this chart is the circumstance that the rediscount rates have moved downward with fluctuations from the year 1920 through the year 1938. 1938 is considerably lower than the year 1920. So far as I am aware, there has been no change in the rates shown on this chart since August of 1937. You ask what effect the declining rediscount rates should have upon the volume of discounts made through these rediscount operations. It would permit the banks to carry greater loans from Federal Reserve banks than otherwise would be considered by them to be profitable. You ask whether or not, as a matter of fact, they have borrowed more money at this rate of 1 per cent than they did when they were paying rates of 1920 which varied from 4.75 to 7 per cent. I don't have the exact figures before me, but I think the volume would be comparatively small because of the lack of demand by borrowers for money from banks. I am familiar with Volume III of Standard Trade and Securities Statistical Section. That is one of the volumes from which I have taken my data. On Page A-3, Section A of the "Banking and Financial Section," at the top of which appear the words "Condition—12 F. R. Banks," it appears that the monthly average bills discounted for the year 1920, when the rediscount rate was 4.75 to 7 per cent, was $2,522,000,000. In the year 1929, when the rediscount rate ranged from 5 to 6 per cent, the total volume by monthly average was $946,000,000. In 1933, when the rediscount rate ranged from 2½ per cent for a short period up to 3½ per cent and then back down to 2 per cent, the average monthly total was $271,000,000. In 1938 the rediscount rate had come down to 1 per cent, and the average monthly discounts for that year appear to be $9,000,000. The figure for September, 1939, would appear to be $6,000,000.

So, as the rediscount rate came from a rate ranging from 4.75 to 7 per cent in 1920 down to 1 per cent in September, 1939, the volume of business came down from $2,522,000,000 to $6,000,000. You ask what that indicates to me. It indicates something that I thought had existed, but not quite to that extent, that the volume of discounts have become quite low as compared with prior years, indicating that business was not borrowing money, and up until September, 1939, had not begun to resume the trend; at least I don't think it had from looking at those figures. That indicates that cheap money does not necessarily have the effect of causing an increase in discounted paper.

You ask whether or not I think it is safe to use a chart of this kind in the light of those circumstances, as any sort of a guide in an effort to arrive at a proper rate of return for natural gas pipeline companies such as the ones involved here. I think that this chart is informative, and taken together with the other charts in this exhibit is essential to a round knowledge of financial conditions. I do not think this chart would be misleading if used in conjunction with the other exhibits that are contained in Exhibit 185. I don't think that it is misleading if viewed in the light of the other supplementary exhibits.

1600 Chart 16 has to do with the rates charged by banks to customer borrowers rather than the rates charged to banks by Federal Reserve banks. That chart shows the almost uniform decline in the prevailing rates charged customers by banks in principal cities since the latter part of the year 1931, and indicates that the rates charged by New York City banks are lower than rates elsewhere in the country, averaging 2.24 per cent in February of 1939; that the rates charged by banks in eight other northern and eastern cities had declined by February, 1939, to 3.33 per cent; and that the prevailing rates charged by banks in twenty-seven southern and western cities had declined by February of 1939 to 4.09 per cent. I do not believe these three curves or a composite of these three curves would apply all over the country as far as interest rates are concerned. The curves themselves are indicative of that. It is clear that there can be a wide variance between New York City and the eight other northern and eastern cities, and there can be a wide variance between these eight northern and eastern cities and twenty-seven southern and western cities. You ask if conceivably there couldn't be the same variation in the rates of the twenty-seven southern and western cities and the remainder of the southern and western cities. That is not so likely, I don't think.

That chart does not indicate to me that money is available to natural gas pipeline companies for over-all capitalization purposes at lower interest rates than it was in 1931. I don't see how it indicates or how it might indicate that it is more difficult to get capital money now than it was when the interest rates were substantially higher than they are now. It might indicate that there is a great surplus of money in the banks which is unwilling to go into capital enterprises under present conditions and that it is finding a limited temporary outlet at very low rates of interest.

You have read to me from the same volume of the study by the staff of the Federal Communications Commission, telephone rate and research department, captioned in the middle of the cover page, "The Problem of the Rate of Return in Public Utility Regulation With Special Reference to the Long Lines Department of the American Telephone and Telegraph Company, Dated June 15, 1938," from page 46 of that study, under the caption, "Improper and Inadequate Measures," the following language:

"In numerous rate proceedings data have been presented which were apparently not pertinent with reference either to the general level of interest cost to utilities in general or to the fair rate of return to the particular utility served. Such data may in many cases be definitely misleading."

You ask me if I agree to that statement. If the data is isolated, it may be misleading.

You have read to me a statement that "One inadequate or misleading measures is the legal rate of interest in the community or state served by the utility." I haven't said anything about legal rate of interest. I have talked about the conventional or bank rate of interest.

I don't believe I have any quarrel with the observation you read on the following page:

"The prevailing rate of interest in the locality for secured loans on business and residential property is another test which has been referred to by the Supreme Court and may be regarded as a rough measure of reasonableness. However, it is evident that such prevailing rate of
1601 interest in the locality for secured loans on business and residential properties will be acceptable evidence

of the fair rate of return only in instances in which it is established that the employment of capital in the particular utility in question involves the same degree of risk."

You ask me whether I agree to the statement you read from the same source as follows:

"The price of short-term money is still another measure which has occasionally been used but which is obviously irrelevant as evidence of the fair rate of return to a utility."

I believe that when I was testifying and introducing charts on trends of United States Government bonds and 90-day time loans and 4 to 6 months commercial paper, that I specifically mentioned that these exhibits were not intended to be used as a measure of the proper rate of return, but that they were introduced to show that the declines discovered in bond yield averages for all types of companies were not an isolated phenomenon, but something that could be confirmed by reference to other indications of interest rates in general.

You ask me whether I agree to the statement of the authors of the language you have just read that it is obviously irrelevant as evidence of the fair rate of return. I think it would be if it were presented by itself as a bit of evidence, but it is not presented that way.

You ask me whether I agree to the following language from the same source:

"Indeed, the direction of movement of short-term money rates is likely to be a misleading indication of the recent or probable future trend of the cost of public utility capital."

I don't think that this exhibit bears that statement out. I disagree with that statement. You ask if I disagree with the following statement, which you have read from the same source:

"The supply of and demand for short-term money arises out of circumstances quite unrelated to the price of long-term money."

In general I think that is true. I believe I have already said that. You ask me whether I agree to the following language:

"Chart 2, page 48, shows the yield from 1927 to 1937, inclusive, on 60 to 90 day time loans, the yield on United States Treasury bonds, and Moody's index of the yield on forty public utility bonds. In 1928, for instance, the rate on 60-90 day loans increased rapidly, reaching a maximum of 8.94 per cent in September, 1929, at the same time that

Moody's bond index was falling or showing only a moderate tendency to rise. From the peak in 1929, however, until the middle of 1931 the rate on 60-90 day loans declined sharply to a low of 1.4 per cent at a time when Moody's average market yield on bonds stood at 5 per cent. The factors influencing the supply of and demand for short-term commercial paper and 60-90 day time loans are apparently entirely unrelated to the factors which influence the market price of long-term secured obligations."

1602 I still feel that my statement can stand; that the evidence here seems to indicate quite definitely that the trend of interest rates in general is following the same relative pattern. They may not be on the same level necessarily, but the pattern seems to be fairly consistent, at least for recent years. I do not agree with that statement entirely. I have not testified about current savings banks interest rates.

You ask if I agree to the language from the same source as follows:

"The yield on United States Treasury securities shown on Chart 2, page 48, is often regarded as being very close to the risk free interest rate, and as an indication of prevailing rate of time preferences. If that assumption is valid the yield on government bonds might be used as a base from which to measure the differential required in the fair rate of return to public utilities because of varying degrees of risk. It must be recognized, however, that the yield on treasury securities may temporarily reflect other factors than the market rate of time preference."

I think that statement is true. You ask whether I agree to the following language from the same source:

"In the interval from August, 1931, to January, 1932, the average yield on government bonds increased from 3.13 to 4.32 per cent; but it could hardly be contended that the basic interest rate increased more than one per cent in the five months, only to decline to 3.19 per cent one year later. Government bonds are frequently bought and sold by the Federal Reserve System to influence money rates, and as a result of this policy, as well as of surpluses in investment funds, it is possible that the yield on treasury securities may at times even go below the riskless interest rates—"

I think it may at times do that. The above quotation continues as follows:

"—the investors in such securities accepting a lower rate in order to achieve the extreme liquidity assured by investment in government bonds. In November, 1936, the average yield on such bonds declined to the extraordinarily low level of 2.29 per cent. Of course, irrespective of whether or not it is the most dependable available measure of risk free interest, the yield on government bonds is not a measure of the cost of capital to any particular utility enterprise."

I have testified that it is not a proper measure. I agree absolutely with the following statement from the same source:

"The price which must be paid for capital by a particular utility depends upon the investor's evaluation of the risk inherent in the operations of that utility."

You ask me whether or not I agree to the following language from the same source:

"Reference to the yield on high grade utility or corporate bonds in determining the fair rate of return for a particular utility is open to many of the same objections that are pertinent in the case of government bonds.

1603 "In the first place, unusual and abnormal influence such as those that have influenced the price of government bonds may carry over to and influence the yield on private secured obligations comparable in quality with government bonds. In any case, the average yield of a class of high grade bonds is not representative of the yield on bonds with different risk characteristics. The indices of security yields are acceptable evidence only to the extent that they reflect the circumstances and character of a homogeneous class of utility or industrial concerns."

Now it says here that "in the first place, unusual and abnormal influences such as those which have influenced the price of government bonds may carry over to and influence the yield on private secured obligations comparable in quality with government bonds." I agree with that statement, but if that influence has an effect upon private secured obligations, the fact still remains that the yield averages on such bonds are the only available measures to which reference can be made in making a study of financial conditions. The yields are what they are. It is true that you have got to exercise judgment as to the risk characteristics; and for that reason we have put in the bond yield averages of bonds showing different risk characteristics. Yes, I have done this to the extent of putting in utility bonds as well as industrial and railroad bonds, and I have described the character of the utilities that are represented in the bonds whose yields are shown in my evidence.

You ask what is meant by a homogeneous class of utility or industrial concerns. That would be a class of like, as I interpret the word "homogeneous," industrial and utility concerns. You ask what I mean by a homogeneous class of utility concerns. I think here the reference is probably to quality of bonds. I don't think the word "homogeneous" means alike, and it naturally could not have the meaning of being alike in every detail, either from a financial or operating standpoint. I think it would mean that all Aaa are to be regarded together. I mean you break down the yields by quality of rating and you get from that a series of curves which show the effect produced by risk characteristics. I thought you were asking me about securities.

You ask what is meant by the term homogeneous class of concerns, whether they be utility or industrial concerns.

Questions Interposed by the Examiner.

You ask me if I agree with the last statement that I requested to be read some time ago. Yes, that is correct, Mr. Examiner. I agree with that statement if I correctly understand the meaning of the terminology "homogeneous class of utility or industrial concerns." The data I prepared is based on such an identification. To illustrate it, we speak of public utilities, railroads, and corporations, and we have broken bond yields down into those classes.

You ask me what the over-all meaning of the term homogeneous is as applied to a class of utility or industrial concerns. I think public utilities are a homogeneous class of utility concerns. I think industrials are homogeneous in the fact they are industrials. If you would like to ask me more questions, I will be glad to answer them if I can.

1604 *Cross-Examination by Mr. Morgan Resumed.*

You ask if it would be quite logical to use the language I asked you to read over again, that "The indices of security yields are acceptable evidence only to the extent that they reflect the circumstances and character of a homogeneous class of utility or industrial concerns," if all utilities met the specifications of being a homogeneous class of concerns. In the case of public utilities, it is usually attempted to break those down by type of individual utilities, that is, telephone companies, gas companies and electric companies, and just what indices are being referred to I don't know, unless they are individually constructed ones. You ask if this doesn't mean that the security yields of other utility bonds or other corporate bonds in connection with the determination of a rate of return for a particular utility are only useful when they reflect the circumstances and character of homogeneous concerns, that is, they belong to the same kind of concern as that whose rate of return is under consideration. I think I can answer that in a way that might get to the point rather quickly by saying in every instance the particular circumstances surrounding the individual company must be taken into consideration in determining upon a fair rate of return. Now, then if we find that data is not available for a particular type of industry, the best we can do is to get data as nearly comparable to it as we can. This last sentence may mean that security yields or bond yields are acceptable evidence only when they belong to the same homogeneous class of concerns as the utility whose rate is under investigation. The more I think of it, perhaps, the more I think it does mean that, but at the same time I just questioned the use of the words "acceptable evidence" because if you don't have any other evidence, you have to accept what you find.

You ask whether, if I have the security yields of a telephone company, which I say is a utility, I don't think it is necessary to show the yields of gas company bonds because it is a utility also, even though it is a natural gas pipeline company which is under investigation. I believe Exhibit 186 has information concerning the yields of natural gas pipeline company bonds insofar as that information is available.

I don't know that I could agree with your suggestion that if there is a security that is closer to the natural gas security and more nearly of a homogeneous class with it than electric distribution bonds and telephone bonds, that would be more pertinent and more relevant in an inquiry such as this. You can take bonds of electric utilities, and if you assume all electric utilities are homogeneous, you can find a Baa bond that has a much different yield than a Aaa bond. All you have to do then is to examine into the rating of a security because both are electric utilities, but I know of no known indexes of gas companies as such or electric utilities as such. You ask me if it is my view that if they are both utilities, even though one be a telephone company and the other a natural-gas pipeline company with no distribution facilities, that they therefore belong to a homogeneous class of concerns. They are homogeneous in the sense that they are utilities. It might be that that is the only sense in which they are homogeneous. It might be that the only sense in which they are homogeneous is the use of that word "utilities" by some persons in describing them.

1605 *Questions Interposed by Mr. Slaff.*

You have read from the same source from which Mr. Morgan was reading a short while ago language commencing at page 50 of the study, as follows:

"Benefits Arising from Use of Objective Data.

"In formal rate proceedings, the evidence as to the fair rate of return has frequently, if not usually, been mere opinion testimony by 'expert' witnesses, unsupported by factual data or by other indications of the basis of the opinion. There has been a not unnatural tendency on the part of regulatory bodies to discount such evidence, even where it has been given by bankers or brokers whose business is the issue and sale of securities. In a discussion of opinion testimony in regard to so-called 'going value,' the Supreme Court has used the following language:"

"'Other experts, testifying to an aggregate, without assigning a proportion to the contributory factors, give estimates so vague as to be little more than guesses, one of them, for illustration, holding to the opinion that ten would be a fair percentage, yet unable to give a reason why the amount should not be less or greater.

"'From the testimony as a whole, one gains a definite impression that the opinions are derived for the most part from a professed experience and understanding of business conditions generally, and very little from any knowledge of the history and circumstances of the particular enterprise.

"'We cannot find that the Commission and the Court went beyond the bounds of legitimate discretion in putting aside these estimates as too uncertain to be followed.'"

That is the end from the quotation on the Columbia Gas case.

"It seems fair to say that this language would apparently be equally descriptive of most opinion testimony offered in past rate cases with respect to the element of fair rate of return. Such theoretical analysis as has been offered in rate proceedings is usually directed towards the establishing of one of a set of conflicting contentions. The same observation holds for the factual data which have at times been presented; namely, that it usually has been selected with a view to the particular propositions sought to be demonstrated."

1606 Schedule 21, Exhibit 185, deals with the gross sales of department stores in the U. S. and the Chicago Federal Reserve District. I used as a basis of comparison the average for 1923, 1924, and 1925 as 100. The schedule indicates that during part of the period, from 1923 down to and including 1938 the relative sales over the whole U. S. were higher and at other times they were lower than in the Chicago Federal Reserve District. You ask what is the general prevailing situation as between the whole U. S. and the Chicago Federal Reserve District. My examination discloses that the figure for the U. S. was slightly in excess of that for the Chicago Federal Reserve District in five of the years shown, namely, 1924, 1931, 1932, 1933, and 1934. In the other years, the U. S. total has been somewhat less than that for the Chicago Federal Reserve District, except in the year 1925 when they were the same.

That schedule indicates that conditions in the Chicago Federal Reserve District were about the same as those for the country as a whole during the period, although in recent years there seems to be some evidence in favor of the Chicago Federal Reserve district more constantly. Over the whole period, if there is any difference, it would appear to be in favor of the Chicago Federal Reserve District. That is the case during the past four years. No, you can't take these department store sales alone and get the whole economic picture. You have got to just select this as one of the several indexes which might be used for that purpose. As to whether it is necessary to weigh against these figures the difference in the tendency of sales of specialty stores as opposed to department stores and a lot of things of that character, I don't know how much refinement would have to be made of these figures. They are published by the Federal Reserve Board or banks as business indexes and purport to indicate the sales comparisons. I think this chart is quite pertinent to the subject of this inquiry.

Schedule 22 has to do with factory employment and pay roll indexes for the United States, the State of Illinois, and the Chicago Industrial area. The state of Illinois is included in that tabulation because it is the state in which the Chicago industrial area is located. It is true the pipeline extends into several other states. You asked me to ascertain whether or not the same type of information was available in any of the other states through which the pipeline passes. I did so undertake and found that Iowa is the only state in that group of states mentioned, that is the States of Iowa, Nebraska, Kansas, Oklahoma, and Texas, from which employment and payroll figures are given; and I find that in the case of the State of Iowa, the only data published were employment data, not payroll data.

I have some notes which I made on that employment data to which I should like to refer. There is a notation contained in 1938 Supplement to the Survey of Current Business, which is published by the Department of Commerce, at page 174, which purports to describe the employment and payroll indexes from information furnished by the State of Illinois, which has furnished the information for both the state and the Chicago Industrial Area; and nowhere in that description do I find mention of whether the employment index gives any indication of whether it is a full-time or part time employment.

I shall read you a sentence: "Based upon the 1935 Federal Census of Manufacturers, the employment index—" that is the one which I have used for the State of Illinois and also for Chicago—"represented 76.1 per cent of all wage earners engaged in manufacturing industries of the state; and the payroll index represented 70.1 per cent of the wage payments." The language I have quoted is from page 174 of the 1938 Supplement. From that I gather that this represents the number of employees, and not the number of man days. I do not know whether it means full time employees or not.

1607 The second portion of the schedule is an index on factory payrolls in terms of dollars. This index of the number of factory employees and the aggregate factory payrolls indicates something about the conditions in the area in which the natural gas transmitted by the defendants is consumed; that being the case, I consider that the information is pertinent to the subject of rate of return in this instance, in the sense that it is information on economic conditions. I do not believe it would have been more pertinent if I had secured some figures for employment in construction work and payrolls in construction work in the same territory. For the purposes for which I have stated that information is to be used, I do not think that the building industry or trades is more nearly related to a pipeline company and its operations than factory employment and payrolls.

With the thought that the prevailing scale of wages would be more pertinent and helpful than the aggregate payrolls of the factories located in the United States and in the State of Illinois and in the City of Chicago, I prepared schedule 23 as throwing some light on that subject insofar as I was able to obtain the required information. I do not know that there is information concerning the comparative wage scales of this country available in published form. There are indexes on wages. I forget the name of the Baltimore firm which publishes construction indexes. I think it is Handy, but I notice that even in that case, the information was not broken down by states. I am not acquainted with particular indexes of the Bureau of Labor Statistics concerning wages per hour, union wage rates, hours of labor, and information of that kind. I believe my answer applies also to the Bureau of Labor Statistics. My researches, however, encompass the publications of the Bureau of Labor Statistics.

To say I have not made any effort to get the actual wage scales except the effort reflected by schedule 23, does not do justice to the extent of the research that I undertook in order to get the information; but nevertheless, my research did not lead me to those particular figures to which you have reference. I could not find published figures anywhere except as above stated.

Going back to your question of a few minutes ago, I have here a bulletin entitled "Employment and Payrolls," issued by the United States Department of Labor, Bureau of Labor Statistics, in which there is a column called "Average Weekly Earnings," which appears to be in dollars, and it is broken down by industries; but the point I am making now that I recall the subject here, is that this is not broken down by states, and that is one of the questions you asked. That has to do with average weekly earnings. You ask whether I inquired as to whether there were statistics available as to the course of the wage scales in this country during the past several years. I think I made some explanation of that on direct testimony when I said that in an attempt to find something on wage scales I had discovered the figures published by the United States Bureau of Labor Statistics, but that they did not extend back of the year 1932. That statement is contained in note 1, schedule 23. They did not compile those data prior to that date. The only available source I could find for the country as a whole, as explained in schedule 23, was the National Industrial Conference Board computations which, while they are not as exhaustive as the U. S. Department of Labor figures, are in fairly close proximity in recent years. Then, as I stated, I attempted to find data by states, and among the states I have mentioned, the only one I could find was for the State of Illinois.

This data compiled by the Bureau of Labor Statistics
covered 89 industries. It was the same kind of data
1608 as that which I used in Schedule 23 in that it dealt
with weekly earnings. You ask whether I have made specific inquiry of the department of labor as to information on wage schedules, wage scales for different types of industry, or whether I have made any attempt to get an over-all figure of any sort on wage scales. Would you consider, if I may inquire, a weekly earning as a wage scale? You are correct in stating that in the year 1930, the weekly earning was almost on a par over the whole United States with the 1929 to 1931 average. The average factory worker in that year got $25.84. You ask how many hours he worked for that $25.84. I do not know that I can give you the number of hours, but it does say that it is a week's time or a week's earnings.

Of course, if you are going to employ labor you would make inquiries as to how much work you would get for a specified sum of money. I don't happen to know the prevailing work-hours in factories over the country in 1930. I do not know the exact difference in the prevailing hours in factories today, but they are probably less. It does not refresh my memory for you to state that it would be about 55 hours in 1933 and that it is now about 42 hours. I do know that hours of labor per week have been by law shortened very substantially since 1930. I haven't examined the law in detail, but I believe you are correct in stating that the working hours are due to be shortened again under the existing law in 1940 from 42 hours a week to 40 hours a week.

I could not tell you precisely how many hours the average factory employee worked for the sum of $26.12 in July, 1939. From the standpoint of a man who has to pay the cost of labor, it is very important to know what that cost is going to be before he can tell anything about the cost of production or the cost of operation and before you can appraise those indexes as indicative of costs to the man who pays the wages, you have got to know those things.

Redirect Examination Interposed by Mr. Slaff.

It is also necessary for the man who has to pay for the labor to know how much of the weekly wages for 1930 was paid to employees on a piece-work basis, as well as on other bases. That has been one common method of wage payment. I have no reason to believe that the practice has been done away with. If there has been a speed-up in the production process for piece workers and if payment per piece has not increased, then we would have a situation where there is not necessarily an increase in the cost per unit of production, despite a decline in hours worked. I think it would be a fair statement to say that regardless of that so-called speed-up of production by labor, there has been an improvement, an improved advance in the technology of industry and production methods in the last eight years.

Cross-Examination by Mr. Morgan Resumed.

You ask if you have got to know those factors of part-time and piece-work before you can appraise Schedule 23 as evidence in a serious proceeding of this character. These schedules were not put in for the purpose of showing the cost to industry of labor. They were put in for the purpose of showing the comparison of economic conditions; and are rather directed to what the employee receives than what the employer pays.

I would be willing to accept your statement that in this rate of return testimony the question has been raised as to the uncertainty of future operating costs and that some of the witnesses have testified that that is one of the hazards confronting the natural gas business. I have
1609 not heard many of the witnesses. I would like to say that for the purpose for which this schedule was intended, I don't believe that a study showing the tendency and the direction of wage scales over the same period of years covered by my schedule No. 23, which you suggest, would be of any material assistance. Then in line with your question concerning uncertainty in con-

nection with labor costs and operating costs, I would like to state that it is to be assumed that if such costs are reasonable that regulatory authorities will allow such costs to the utility concerned.

Schedule 24, "Gas, electric and telephone utility companies serving the city of Chicago, total operating revenues, years 1929 to 1938," I take as the base of 100 the average of the period 1929 to 1931. That schedule deals with gross operating revenues which indicate in the case of Peoples Gas Light & Coke Company and Commonwealth Edison Company there has been an increase in the gross operating revenues, while in the case of the Illinois Bell Telephone Company there has been a decrease in the total operating revenues. You ask why I did not use the net operating revenues instead of the gross operating revenues. I used the gross operating revenues because I felt that they were an indication of the volume of business that was being done by the utilities, and that is what I wanted to show.

You ask why I did not include the traction companies, if I just wanted to know the gross. Well, I believe in general that although traction companies used to be considered in the class of utilities years ago, that their condition is such nowadays that they are not generally included as such. They are regulated concerns, but they are different from the type of companies we have in mind here, as I have pointed out previously, in that these all furnish service to the home and are more likely to reflect the direct effect of economic conditions than in the case of traction companies from a gross revenue standpoint, because transportation is a vital necessity to so many people that economic conditions may or may not have quite as much to do with traction revenues as with these types of revenues.

You ask whether these figures indicate increased prosperity on the part of the Peoples Gas Light and Coke Company and Commonwealth Edison Company and a decline in that respect of the telephone company. I have made no statement about prosperity. I have merely attempted to show the volume of business that was being done by these companies; and since that volume is dependent upon the conditions in which the consumers find themselves, it seemed to me that that was the thing to which attention should have been directed. I thought I had the figure showing how much of the $37,976,207, gross revenues of Peoples Gas Light & Coke Company for 1938, is escrowed and held in abeyance, not subject to their use. The figure you state, $2,140,300 sounds about right. This would reduce the revenues for that year to $35,835,907 if those escrowed funds are not counted. That would be less than for 1930.

I have a figure for 1931 for the net revenues of Peoples Gas Light & Coke Company. It is $9,676,084. I believe these figures are on a corporate basis. The net figure for 1938 is $6,010,615. If $2,140,300 be subtracted from that amount, the result is $3,870,315 which is less than one-half of what it was in 1931. You ask whether that is the situation with reference to the other two companies when we take their net revenues as opposed to the gross operating revenues, or total operating revenues. I do not know the exact situation, but I am inclined to think that it is not similar.

My recollection is that Peoples Gas did not begin the supply of natural gas until October, 1931. On the assumption that the principal portion of gas purchased represents natural gas purchased from defendants, that item it would appear represented in 1932 approximately a third or more of the total cost of operations. For 1938, the gas purchased figure was $12,451,281 and total operating expenses including taxes and depreciation, maintenance, et cetera, were $31,965,592. There is also an item covering cost of gas produced in 1938 which was $1,384,422. I do not know what the comparable figure was for 1930 or for 1931. All the figures I have for 1930 are three items,—operating expenses, state and local taxes, and depreciation. I could get no break-down of operating expenses from published figures. I could get those figures if I was assured access to them. They are not published. If I can find them in the annual reports filed by Peoples Co. with the Illinois Commerce Commission, I would be glad to obtain those figures for 1930. The figures I have used were published in Moody's manual of investments.

You ask whether the company has made an adjustment on account of over-accruals for taxes in recent years. I have found in attempting to acquire this information that

Moody's referred to several years income figures as having been later revised; and my understanding was that the revised figures were contained in the annual reports of the company to its stockholders but I was not able to obtain such annual reports. My understanding was that these revised figures had to do with taxes. I do not know whether the Illinois Commerce Commission in the rate proceedings involving that company found that it was attempting to charge to operating expenses substantial amounts for the item of taxes to which it was not properly entitled. I have not become familiar with that.

You ask whether the figure for Commonwealth Edison Company included revenues for Super Power Company for 1938. I investigated that point and found that for 1938, there was a footnote indicating that the year's figures included the Super Power Company; but the footnote appeared on no other year, so I assumed it related solely to the year 1938. I am not acquainted with the revenues of Super Power Company for 1937. You have handed me a report on Super Power Company of Illinois, filed with the Illinois Commerce Commission for the year 1937, which shows at page E-9, total revenues to be $6,654,669.22. The revenues from the Commonwealth Edison Company for the same year were approximately $2,000,000.

Cross-Examination by Mr. Morgan Resumed.

You call attention to my statement shown at page 7924 of the record in which I stated: "I think it would be helpful to summarize it, to summarize my testimony, and in doing that it may be said that the period since 1929 has been attended by severe economic depression, and that this period has been characterized by declines in interest rates." You ask that if in the light of all that has been developed concerning the charts and schedules contained in Exhibit No. 185, it would not have been more accurate had I said that it was characterized by declines in interest rates on government securities, short term bank loans, short term Federal Reserve rediscounts, and refunding operations in the matter of bonded indebtedness, particularly with reference to the highest rated bonds. I would not say that sort of summary would be entirely accurate for the reason that the statement

applies equally well to yields on outstanding bonds of domestic corporations, including the three types,
1611 public utilities, industrials, and railroads, as indicated in Chart No. 5. Mr. Slaff has referred to the circumstance that in the same answer, on Page 7924 I stated that the period has been characterized by declines in interest rates and return on money to about the lowest levels witnessed in this country since 1900. You ask if I meant that bond interest rates and the return on money had reached these low levels or whether I would separate the two parts of the answer. I would not attempt to make any separation there. You asked if interest rates for all classes of bonds had declined to the lowest levels since 1900. If you are talking about C bonds as rated by Moody, I have not made a study of that class of securities, but my statement was based on my exhibits that I set forth here and as indicated in the exhibits, the basis was a company having some degree of soundness and credit, and all those things which go to make up a company that deserves a rating from Baa to Aaa. I think it is quite evident what I am talking about.

You ask whether, when I applied the observation I have just made, that the decline in interest rates has descended to the lowest levels witnessed in this country since 1900, whether I include in that statement anything but the highest class of bonds. I can only say this in answer to that: If an examination of Chart No. 1 is made, it will be found that where there is a decline in Aaa it is usually accompanied by a decline in Aa, A, and Baa.

You ask whether the A's and the Baa's have not been lower in the past than they are at the present time. I think the language here is quite plain, that I have been talking about a period of time, a period since 1929, and I have been trying to summarize what I could as briefly as possible about what happened during that period.

Questions Interposed by the Examiner.

You ask whether in that period, the decline I am talking about there brought interest rates down to the lowest level since 1900. I qualified that to "about", if it makes any difference. You ask whether or not whatever the low point is after 1929, it is lower than it has been since 1900. That would be the sense of my statement.

Cross-Examination by Mr. Morgan Resumed.

I have already stated that I was talking about a period and not about particular years like 1932 or 1933 or even 1931. You asked when it reached the lowest level in the case of the very highest grades of bonds. That lowest level, I think, could fairly be said to have been reached in the middle of 1939 for bonds of Aaa, Aa, and A. For bonds of Baa, the lowest level reached in 1939 was about 4.80 as compared with the low level of 4.50 reached in 1936, which was the lowest point up to that time since the period of 1920 on. In 1938, Baa bonds reached a point 6.50 or thereabouts. I think a fair statement would be that in the middle of 1939, they all reached approximately the same point together, despite the fact that Baa bonds seemed to be slightly higher in 1939 than they were in 1936.

You ask if the yields on A bonds were not also higher in 1939 than in 1936. If you are talking about a difference of 3/100ths of one point, all right, I would be willing to grant the statement that the A bonds were higher in 1939 than in 1936. There is not any question that the equity money and the return on equity money is not reflected in these curves. You ask if that is true of every chart and every schedule that I have in my exhibit. I have already stated that Exhibit No. 186 contains some data on equity
money. You ask whether I was talking about bond
1612 investments and not equity investments when I
stated that the returns on money had reached the lowest levels witnessed in this country since 1900. I think I will say in all fairness that I was using the terms synonymously.

You are generally correct in stating that the costly part of the capital is the part that is represented by equity securities or common stock. That is true today and it has been true for many years. When I made the statement: "During the period since 1929 earnings of public utilities have shown a greater degree of stability than those of industrial and railroad corporations, which is an indication that public utilities in general are less subject to risks confronting other forms of business enterprise," I was talking about utilities in general. You ask what risks my Charts Nos. 12, 13, and 14 show that public utilities in general are less subject to than other business enterprises. Well, any company that can show a fairly stable level of earnings over a period of years, I believe, would be classified as a company which was not subject to as much risk as companies which did have those wild fluctuations in earnings. No, I am not speaking of the risks of fluctuating returns at all. I am speaking of a condition which produces stable earnings and the risk inherent in these conditions. The income of the past does not always necessarily reflect the risks that confront a particular enterprise in the future; but a lot of us depend a great deal upon past experience and past records.

You ask if we must not look further than these curves in order to determine whether a particular regulated industry is freer from risks than other businesses. I would say if it were possible to do so, I would have compiled statistics about future conditions, but they do not exist and I have just given you everything I could which would make it possible to draw some conclusions based upon experience. It is conceivable that the present would disclose facts which present risks that are not reflected in past earnings; and I think that these charts indicate that as well.

Questions Interposed by the Trial Examiner.

I have a list of the 21 leading utility companies that appear on my Chart No. 13.

(At the direction of the Trial Examiner, the list was incorporated into the record as follows:

21 Leading Utility Corporations.

American Water Works & Electric Co., Inc.
North American Co., The
Pacific Lighting Corp.
Public Service Corp. of New Jersey.
Standard Gas & Electric Co.
United Gas Improvement Co., The
United Light & Power Co., The
Boston Edison Co.
Brooklyn Union Gas Co., The
Commonwealth Edison Co.
Consolidated Edison Co. of New York, Inc.
Consolidated Gas Electric Light & Power Co. of
  Baltimore.
Detroit Edison Co., The

Pacific Gas & Electric Co.
Peoples Gas & Electric Co.
1613 Peoples Gas Light & Coke Co., The
Southern California Edison Co., Ltd.
International Telephone & Telegraph Corp.
New England Telephone & Telegraph Co.
Pacific Telephone & Telegraph Co., The
Southern New England Telephone Co., The
Western Union Telegraph Co.

Redirect Examination by Mr. Slaff.

I remember that during the course of my cross-examination shown at page 8122, certain questions were put to me and answers made by me as just read by you. The effect of my answers was that since my testimony on direct I had made a study on yields on preferred stock and common stocks and that it might be desirable to present them as testimony; that such studies had not been prepared at the time I had testified before, that I had made studies which give recent indications of cost of common stock capital, so far as I could derive a cost for that kind of capital from market prices of outstanding stocks.

(At this point, counsel for the commission handed the reporter a document headed: "Yield at Market Prices of Electric Operating Utility Preferred Stock and Number of Times Dividend and Prior Requirements are Earned, Market Prices for Week Ended November 17, 1939, Income for Latest Twelve Months," with the request that it be marked for identification. At the direction of the Examiner, the document was marked Exhibit 197.)

Exhibit No. 197 is one of the studies that I referred to at page 8122. This study is a compilation of yields at market prices of electric operating utility preferred stock and number of times dividend and prior requirements are earned, based on market prices for week ended November 17, 1939, and times requirement earned, based on income for the latest twelve months.

This list contains 21 electric operating utility preferred stocks and includes all of such preferred stocks listed in Schedule 19 of "The Problem of the Rate of Return in Public Utility Regulation," published by the Federal Communications Commission June 15, 1938, for which preferred dividends and prior requirements were earned in excess of one and one-half times in 1938. This exhibit shows that the yields at current market prices for these preferred stocks can be classified in this manner:

For one issue, 4 per cent;
For three issues, between 4.01 and 4.07 per cent;
For four issues, between 4.25 per cent and 4.5 per cent;
For five issues, between 4.5 and 5 per cent;
For three issues, between 5 and 5.5 per cent;
For four issues, between 5.5 and 6 per cent;
For one issue, 6.09 per cent.

(EXHIBIT NO. 197 was offered and received in evidence without objection.

At this point, counsel for the commission handed the reporter a document entitled: "Earnings—Price Ratios of Electric Operating Utility Common Stocks and Per Cent of Gross Income Available for Common Stocks, Market Prices for Week Ended November 17, 1939, Annual Income Per Latest Quarterly Reports," with the request that it be marked for identification. At the direction of the Examiner, the document was marked Exhibit No. 198.)

I have before me Exhibit No. 198 which was prepared
under my direction. This exhibit represents a com-
1614 pilation of earnings—price ratios of electric operating
utility common stocks and per cent of gross income available for common stock—I would like to have that "s" in the word "common stocks" on the second line of the caption deleted—based on market prices for week ended November 17, 1939, and annual income from latest quarterly reports.

This list contains the common stocks of 14 electric operating utilities and the earnings-price ratios may be classified or grouped in this manner:

One issue at 4.5 per cent;
One at 4.98 per cent;
Three between 5.83 and 6 per cent;
One at 6.32 per cent;
Two between 6.7 and 6.8 per cent;
One at 7.06;
Three between 7.65 and 7.8;
One at 8.53;
One at 9.11.

And I might add that this list of common stocks includes all electric operating utility common stocks listed in Schedule 26, the schedule showing 1937 earnings, March, 1938, prices, in the publication entitled "The Problem of the Rate of Return in Public Utility Regulation," published by the Federal Communications Commission, June 15, 1938, and I might add that only stocks were included for which at least 5 per cent of the outstanding issue was held by the public.

(EXHIBIT NO. 198 was offered and received in evidence without objection.)

You have handed me a document entitled: "Schedule of Securities, Massachusetts Mutual Life Insurance Company," dated December 31, 1938, and asked me to refer specifically to pages 9, 10, 11, 13, and 14 of that document. That is the same type of document that Judge Morgan had with respect to the Equitable. It purports to contain a list of bonds and securities held by the Massachusetts Mutual Company. The caption for the securities or bonds listed at the pages I have mentioned "Power, Light, Gas, Water, Traction, Telephone, and Telegraph Bonds, includes within the caption bonds of the following companies:

Arkansas-Louisiana Gas Company,
Cities Service Gas Company,
El Paso Natural Gas Company,
Lone Star Gas Company,
Oklahoma Natural Gas Company,
Panhandle Eastern Pipeline,
Southern California Gas Company,
Southern Counties Gas Company of California, and
Southern Natural Gas Company.

Included among those companies are so-called pipeline companies. You ask whether those various companies are described in detail in Mr. Smith's direct testimony, and whether they are included in the gas companies which he described in detail. I find one exception, Mr. Slaff, and that is the Lone Star Gas Corporation, which is listed on page 11, but by referring to Schedule No. 5 of Exhibit 186, page 3, I find the company represented or known as Lone Star Gas Company. It probably is a different company. With that exception I find them all represented.

1615 *Cross-Examination Interposed by Mr. Morgan.*

I would hesitate to say that all those companies listed in the pamphlet you have there own some distribution.

Question Interposed by Mr. Booth.

I would not be qualified to state whether the Panhandle Eastern Pipeline Company owns any distribution facilities. I haven't made sufficient study and I don't have the facts in mind.

Redirect Examination Resumed by Mr. Slaff.

I cannot say, but I don't believe Mississippi River Fuel Corporation owns any distribution.

You hand me a booklet entitled "96th Annual Report of the Mutual Life Insurance Company of New York," and direct my attention particularly to pages 30, 31, 32, and 34, and ask whether or not there is a list in that booklet of public utility bonds held by that investor. Yes, this list purports to be a list of bonds owned by the Mutual Life Insurance Company. There is a separate section devoted exclusively to public utility bonds, beginning at page 29. Included in that section are the bonds of the Mississippi River Fuel Corporation, El Paso Natural Gas Company, Lone Star Gas Corporation, Northern Natural Gas, Ohio Fuel Gas, Panhandle Eastern, and United Fuel Gas Company. It would be my assumption that that investor regards those bonds as public utility bonds.

You hand me a booklet entitled "The Travelers Year Book 1939, 75th Anniversary". It appears to be a similar booklet to the one to which I have just referred and is for Travelers Insurance Company, Travelers Indemnity Company, and Travelers Fire Insurance Company. It contains a list of bonds held by several of the companies that you mention and also including the Travelers Insurance Company. It has a separate section devoted to public utility bonds beginning on page 37 and on page 38. This list is for Travelers Insurance Company. Within that separate category of public utility bonds, this investor includes bonds of the Lone Star Gas Corp., Northern Natural Gas Company, Oklahoma Natural Gas Company, Panhandle Eastern Pipeline Company, and Southern Natural Gas Company.

You have handed me another document which appears to be the 1939 Year Book of the Aetna Life Insurance Company. This booklet also contains a list of bonds held by that company. On page 11 appears a caption "The President's Annual Report." It contains a statement beginning at page 9 of bonds and stocks of the Aetna Life Insurance Company. There is a separate section on pages 35 and 36 devoted to public utility bonds. The caption is "Public Utility Bonds". Included in that section is listed the bonds of Panhandle Eastern Pipeline Company and Southern Natural Gas Company.

You have handed me a booklet entitled "The 72nd Annual Business Statement, 1938, Metropolitan Life Insurance Company, Containing a List of the Bonds and Stocks Owned by the Company December 31, 1938." At page 4 appears to be the balance sheet of Metropolitan Life Insurance Company as at December 31, 1938 and public utility bonds are included on the asset side of the balance sheet at $589,927,007.34. I would say it is a sizeable investor in public utility bonds. It has a separate listing of public utility bonds on pages 47 to 53 inclusive under the caption "public utilities". Under that caption, they list the bonds of the Mississippi River Fuel Corporation, Cities Service
1616 Gas Company, El Paso Natural Gas Company, Northern Natural Gas Company, Ohio Fuel and Gas Company, Panhandle Eastern Pipeline Company, United Fuel Gas Company, and Southern Natural Gas Company. My interpretation of this would be that investor regards those as bonds of public utility corporations.

Question Interposed by the Examiner.

I have not taken time to examine whether or not the investments in the bonds of the companies I have named specifically are in each case sizeable.

Redirect Examination Resumed by Mr. Slaff.

In the case of the Metropolitan, the following figures appear:

For Cities Service Gas Company, First Mortgage Pipeline, 3¾ per cent, the admitted asset value is the amount shown, $10,000,000; El Paso Natural Gas Company, First Mortgage Bonds, $1,988,000; Mississippi River Fuel Corporation, First Mortgage Pipeline bonds, $3,374,000; Northern Natural Gas Company, First Mortgage and First Lien Series A, $4,692,000, and for the same company, the same bonds, Series B, $614,000; Ohio Fuel Gas Company, identified as Notes, $4,289,691.26; and Panhandle Eastern Pipeline Company First Mortgage and First Lien Series A, $4,298,439.20; Southern Natural Gas Company First Mortgage Pipeline due in 1953, $3,000,000, due in 1952, $602,976.53; United Fuel Gas Company, identified as Notes, $4,289,691.26.

In the case of both of those note issues a note is appended stating they are guaranteed by Columbia Gas and Electric Corporation.

I was requested while I was on the stand in my direct testimony to bring various figures up to date. In the course of my cross-examination I have done so with respect to every instance where I was requested to do so. There is one set of averages that was going to be worked out which I have not put in. One item I might mention is the names of the twenty-one leading utilities which has already been furnished to the reporter.

With respect to Chart 13, I was requested to compute certain averages which I have done.

You ask if I could get an average for the period 1930 to 1938 for the different types of companies listed. The information on which these averages are based is contained in schedule 17, pages 1 and 2.

You requested information concerning the average percentage of net profit to total invested capital for the period of 1930 through 1938. Those figures are as follows:

For 400 leading industrial corporations, 5.34 per cent; for 21 leading utility corporations, 5.60 per cent; and for 42 leading railroad corporations, 3.15 per cent.

Cross-Examination by Mr. Morgan.

There were five or six pipeline companies in those portfolio lists to which I referred a little while ago. You ask whether or not a great many of them are holding companies that own distribution facilities and whether many of them directly own distribution facilities. As I have already stated, I would rather not answer those questions. I 1617 have compared the name appearing in the list of bonds in these pamphlets with the lists of companies shown in Schedule 5, pages 1 to 6 inclusive, of Exhibit 186, and on that basis made my statement. I understand that list in Exhibit No. 186 does not exclude distribution companies, but is confined to companies which own pipeline facilities or production, although they may own also distribution facilities.

You ask whether, without knowing any more about those gas companies whose bonds are listed in those portfolio lists, as to their distribution facility holdings, and their other characteristics than I have stated here, I would be willing to say that they and the telephone company whose bonds are listed here, and the telegraph company whose bonds are listed, constitute a homogeneous class of concerns. My answer is that insofar as they are all classed as public utilities, I would say that they were. You ask whether public utilities and homogeneous class of concerns to me mean one and the same thing. When you group things under classifications the line of distinction has to be drawn in order to make your grouping; and certain bases of homogeneity have to be assumed or determined upon in order to make the selection. Now, in the sense that all of the companies can be included under one group or another, they are homogeneous to the companies which are in the group in which they are included.

I am speaking generally and do not necessarily agree with your suggestion that if they are put under the same caption and called public utilities, they belong to a homogeneous class in the sense that that term is used in the Federal Communications Commission study that we considered.

(At this point, counsel for the defendants called the Examiner's attention to the fact that a small tract of land containing 23/100ths acre had been omitted from Exhibit 143 and that they had secured another affidavit including that piece of land. The affidavit was handed to the reporter with the request that it be marked for identification. The affidavit was described as one by Sibley Jines, dated November 17, 1939, covering a tract of 23/100ths of an acre in Beaver County, Oklahoma. The same affiant had made a previous affidavit. At the direction of the Examiner, the document was marked Exhibit 199. EXHIBIT 199 was offered in evidence, and was received over the objection of counsel for complainant and counsel for the commission, who were allowed an exception.)

1618 **CHARLES W. SMITH**, a witness for the Federal Power Commission called for cross-examination, testified:

(November 30, 1939.)

Cross-Examination by Mr. Morgan.

My title with the Federal Power Commission is Chief of the Bureau of Accounts, Finance and Rates. I was assigned to that position on July 1, 1936, but I had been retained by the Commission as a consulting accountant prior to that time. The division of rates was transferred to my jurisdiction about February, 1938.

The duties of my position are many and varied. First of all, I have charge of all accounting matters which come before the Commission, the duty of preparing systems of accounting, handling report forms, making accounting investigations in all sorts of cases.

Secondly, as to the Division of Finance, I make a study of all security issues which come to the Commission for approval, all mergers and consolidations, and all financial matters which come to the Commission generally, including rate of return matters such as we now have here.

As to the Division of Rates, the Division of Rates receives all the rate contracts, the rate schedules filed by public utilities as defined by the Public Utility Act and natural gas companies as defined by the Natural Gas Act; making studies of those schedules, making a full investigation in rate cases; making reports on investigations and the staff gives testimony under my jurisdiction.

In addition, we have a statistical organization in the Bureau of Rates which compiles statistics, particularly rate statistics.

Among the things that will be filed with the Commission and handled by my department are the reports of the natural gas companies concerning the volume of sales and revenues. The Commission only recently adopted a report form for natural gas companies and they will be required to file a comprehensive financial report for the first time for the year 1939. However, in response to Orders 51 and 53 of the Commission, certain selected financial data were filed by many of the natural gas companies. I believe that included in that data is volume of gas sold under each contract and the amount received for that gas sold under each contract. Those come to my department.

Immediately before I came with the Federal Power Commission, I was with the Maryland Regulatory Body for seven years, from 1929 to 1936. My duties with that Commission were pretty much the same as they are today except the duties were confined to utilities operating in the State of Maryland and under the jurisdiction of the Public Service Commission of Maryland. Of course, the utility companies included telephone, water, motor vehicle carrier, street railways, and so forth, whereas the jurisdiction for the Federal Power Commission is, as you know, limited to electric and natural gas companies.

I stated that while with the Maryland Commission I testified on many occasions in rate cases.

1619 I testified as to accounting and financial investigations which were made under my supervision, very largely made by myself, and as to the rate of return, including also a good deal of testimony concerning economic conditions and economic facts.

I might mention that the testimony given on behalf of the Commission in regard to the use of index numbers in the famous C. & P. Telephone case, which went to the Supreme Court, were introduced by me. These were telephone cases, electric cases, gas distribution cases, traction cases, motor transportation cases, and all kinds of cases, including one company which distributed natural gas which it purchased from the affiliated company, necessitating a study going back to the source of supply. In none of those instances did I recommend a reduction in the rate of return. I never gave an opinion as to the rate of return. I gave testimony as to the facts. It is my understanding it is the Commission's job to weigh the facts and make the determination.

In formal proceedings I have never recommended or expressed my judgment under oath as to what the proper rate of return might be. Of course, in the State Commissions you have a good deal of informal cases, a great many informal proceedings, and there I was frequently called upon to express an opinion as to rate of return. That was in connection with negotiated rates. I have never testified under oath as to my judgment what a rate of return in a particular case ought to be. I feel that is not my province. No, sir, the facts I have prepared in each case have not generally been in the direction of reducing rates. The facts I have prepared have always been facts.

I can't say if any rate reduction was ever made solely on the basis of testimony given by me. I can state I was in a number of cases where rate reductions were made. I testified in the C. & P. Telephone case, the Potomac Edison case and the Conowingo Power case. In those cases and in others rate reductions were made. Just how much my testimony had to do with the ultimate result I am unable to say. It is not true that in the testimony I have given in connection with those studies I have testified and approached the subject from the viewpoint of those opposed to the contentions of the regulated company.

I approach all these cases with the desire of getting the facts; and any fact which I think will enable the Commission to make a fair and adequate decision I would give, I don't care whether in favor of the company or in favor of the public. I never withheld any information from the Commission which I thought the Commission should use in making a determination. I will state this, however, while I was with the Maryland Commission particularly I had a small staff. I was investigating large public utilities with many times the force I had. I didn't go out of my way hunting for things in favor of the utility. Anything I came across in the ordinary course of investigation I brought it out. I considered my duty primarily to be to the public and to be sure the public's side was presented properly.

The side I represented was an impartial side. I didn't spend a lot of time hunting up things which may be in the company's favor, although I had many times found items in the company's favor and so related them. 1620 I would like to refer you to the Potomac Edison case where I disallowed very large sums from the cost of the electric plant, and I restored because of mistakes the company had made almost as much as I disallowed. That is the only way I can work as a professional accountant.

You ask if my work has been primarily from the viewpoint of an accountant. It is much more than that. I have been for twenty years preparing for this work involving the administrative process, accounting, economics and law. Specializing in that field for twenty years, I have studied subjects throughout that time which I hoped would train me for a competent administration in the field of administrative law. I have taken many courses in economics, and am a member of the American Economic Association, and I have constantly studied economics.

I feel the same degree of responsibility to both sides in preparing my case for the Commission. When it comes to a rate of return I have given impartial statements. In many cases I have had to do a great deal of research work. I will refer you to the question of labor rates which you spoke of yesterday. I probably have made the only thorough labor wage rate investigation in the City of Baltimore by going to the payrolls of contractors and taking off the amounts paid. That was given to the Commission impartially. It was presented to the Commission as a fact. My duty is to gather facts and give them to my employers. My primary responsibility has been to protect the public interests. I have never been in a case dealing with a large utility where the utility was not adequately represented. I have never testified for a company.

I have never initiated an issue of securities. I have had many consultations with public utility officers regarding security issues, plans and methods of financing. There have been occasions when I inquired how companies have been financed, wanting to know that, and I think I have been instrumental in helping companies to refinance by drawing their attention to certain market conditions and by raising the question. As far as security issues are concerned I have had a great deal of experience in making a study of security issues, the proper rates at which they should be issued and questions involving when securities should be issued.

I was discussing coupon rate, mortgages, mortgage provisions, exculpatory clauses, the whole field.

The regulatory body can not control the investor's attitude whatsoever. However, all the Commission would have to do is frown upon a security issue and that security issue would be absolutely killed. You know that it is a very serious matter, the approving of a security issue. Very frequently in my work we have had to discuss matters with the officers of companies to get them to make changes which we recommended in order not to have any issue at a proceeding, because it might do some damage to the issue itself.

I remember not long ago a well-known attorney, I can give you the name if you wish it, was in my office. I urged him to make some corrections about certain clauses in the indenture. He didn't want to do it, but he went to the bankers in New York and came back and said, "The bankers insisted on the very thing you have mentioned. Thanks to you we were prepared for it."

1621 In these days while it is true if the regulatory body frowns upon an issue of securities it will kill it, the fact they smile on it, to use the opposite figure, doesn't mean the company is going to pay the stated rate of interest when it offers the security for sale. You did find it quite frequently in the so-called golden-glow days in the '20's.

I would like to explain my last answer. It is very clear you don't understand what I had in mind. Back in the '20's it was the favored practice of utilities to advertise widely the fact a security issue was approved by a public service commission. When I was with the Maryland Commission we tried our best to stop that practice because we felt it was misleading. We approved some securities which were not Aaa, and we were afraid the advertising of the approval of the Public Service Commission, the "widespread advertising", would be misleading.

I have said that my dealings with the issues have been from the standpoint of a member of a staff of a regulatory body with a sense of responsibility primarily to the public, but I have also studied it from the standpoint of the man who has to have the money or who wants the money. My approach has been from both angles. After all, a person in my position has a responsibility to see that the company is soundly financed. That is the reason I think commissions are charged with the duty of regulating security issues, in order to do everything it can to help the company get the money and get it as cheaply as it can. I don't see any difference between the two viewpoints whatsoever.

I have never been employed by any private interest when my services and my talents might be utilized in developing and marketing an issue of securities. I have been consulted many times in that respect. I have done quite a bit of work on the side while with the Maryland Commission as a consulting accountant, consultant to financial houses, one financial house at least, and on tax matters, and I have written opinions on reorganization for one stock brokerage firm. I have been consulted about those matters. I have never been in the employ of any company for that special purpose only, for the sale of securities. I don't believe I said anything about that phase of my activities in my direct testimony.

You asked whether I was employed as a consultant on a compensation basis and asked something about a security that was pending before the Commission on whose staff I was serving. I have not been so employed upon a matter pending before a Commission; but before a Court, I received as much as $500 for one opinion on a reorganization matter which did not involve a public utility. The opinion concerned a plan of reorganization from the viewpoint of taxation. The case was in the court and it was a proceeding involving the reorganization, and I was retained to study certain phases in connection with it. It had to do with the entire method of reorganizing the company, because the method of reorganizing the company involved a big tax question, and the plan of reorganization of the company, the method of security issues, and so forth, was changed as the result of my opinion. The tax liability question frequently is one of the most major questions in proceedings of that sort.

Exhibit 186 was prepared under my immediate direction. I selected the character of the material. I suggested where and how it might be assembled, but I gave those under me considerable leeway as to where they could
1622 get the information, because the information is pretty hard to get at this time.

Schedule 1 of that exhibit is styled, "Natural Gas Industry in the United States. National Revenues from Sales to Consumers, Gas Sales to Consumers, and Number of Gas Customers." That has to do with the transactions of natural gas distribution companies. The figures representing the revenues of natural gas pipeline companies from gate rate sales are not reflected here. It is my understanding that the figures for natural gas sold to companies who mix it with artificial gas before it is sold are not shown. I would not like to state that this exhibit does not represent very much of the gas that is marketed by defendants.

In general, I am familiar with the record in this case. Of course, there is a great deal in this record that I am not familiar with. I have had a staff of auditors looking into the record of this company for a good many months now.

I believe you are right in that 90 percent of all of the gas transported by defendants is sold to the Chicago District Pipeline Company, and that in turn is handled by the Peoples Gas Light and Coke Company, Public Service Company of Northern Illinois, and the Western United Gas and Electric Company.

You ask whether it is true that all of these companies sell mixed gas. The reason I hesitated in giving an answer to your question,—if you take gas sales to consumers in M. C. F.'s for the year 1938 you will find it is 1,200,607,000 M. C. F.'s. Now, if you will turn to Schedule 3 you will find that the total natural gas consumption, according to certain governmental statistics which we were able to obtain, was 1,410,636,000 M. C. F.'s in 1937. I think by considering both schedules you can get a pretty good picture of the situation. One by itself, as I think you have indicated, would be inadequate. As far as the two defendant companies are concerned, the consumer data are not shown on Schedule No. 1. The source of the figure I gave for 1937 and 1938 is given in the schedule, "Monthly Summary of Gas Company Statistics, Annual Supplement," issued by the American Gas Association in March, 1939. I think probably that was a preliminary set of figures. Since my exhibit was prepared, I think the final figures became available. That is the reason that the final figures are not in that exhibit.

I don't believe I have checked the final figures as reflected in the October statistical bulletin, No. 37, which in this record is Exhibit 179, to see whether or not they check with my figures shown in Schedule 1. Checking the figures of my Schedule No. 1, under the caption "Revenues from sales to consumers", in the first column of figures for 1937 and 1938 with the final figures shown in Exhibit 179, the total revenues for 1937 were $443,219,000, whereas the total revenues for that year shown by Exhibit 179 amount to $443,408,000. For 1938, the figure shown in Schedule No. 1 was $419,474,000, whereas that shown in Exhibit 179 was $416,580,000. The difference in the 1938 figures is approximately three million dollars. I think you should use Exhibit No. 179 for the years 1937 and 1938 instead of the figures in Schedule 1 wherever there is a conflict.

1623 In Schedule 1 the gas sales to consumers in M. C. F.'s is shown as 1,316,140,000, whereas the pertinent figure taken from Exhibit 179 for the year 1937 is 1,314,907,000 M. C. F. For the year 1938, Schedule 1 shows

1,200,607,000 M. C. F., whereas Exhibit 179 shows 1,213,352,000 M. C. F.

In order to conform this schedule to the revised or final figures it would be necessary to change those figures and the figures in the succeeding four columns.

For the year 1937 the average number of customers shown by Schedule 1 was 6,859,300, compared to 7,066,000 shown in Exhibit 179. Those figures in Exhibit 179 show the number of gas customers at the end of the year. My figures show the average number of customers during the year. For the year 1938, Schedule 1 shows 7,033,700 customers, whereas Exhibit 179 shows 7,231,000 customers at the end of the year 1938.

To the extent that there are any changes, in order to be in conformity with the final figures it would be necessary also to recalculate the figures represented in the last five columns of figures in each of the three sections of that page for the years 1937 and 1938. I am not sure of the changes in the number of customers because my figures are average number of customers during the year figures while those in Exhibit No. 179 shows gas customers at the end of the year. The average shown here was taken from the bulletin mentioned at the bottom of the page.

There was an increase in the revenue of distributors selling natural gas between 1929 and 1938. I believe the percent of increase would be 11.3. Going to the column immediately below that, the percent increase of the total gas sales in terms of volume between the years 1929 and 1938 would be 22 percent. The average number of customers shown in the next column increased between the same years by 23 percent. It appears to be true that the first column of figures under the caption, "Revenue," when compared with the figures for the other two sections, the one dealing with gas sales and the other with the average number of customers, indicates that in order to get 11 percent increase in revenues these distributing companies have had to handle an increased volume of gas to the extent of 22 percent; and they have had to handle it for an increased number of customers by 23 percent.

You asked if they had to build a line and make an installation in the home or the place of consumption of every one of those increased number of customers. I don't know how much increase in fixed capital they would have to be making. You can build some lines into an apartment house and to a good many customers, and that is pretty much the custom these days, so I would like to have the exact figures. I do not like to deal in generalities when the exact figures can be had. It is bound to involve some increased cost. I don't think it would require the increased capital cost you imply, because I do have the specific figure on Schedule 2, it being $2,317,000,000, in round figures, in 1934, and $2,400,000,000 in 1937. Now take the number of customers during those years and you will find a substantial increase.

It is true we are comparing the number of customers in 1938 with those in 1929, but you asked me a question which involved a question of judgment as to whether or not there would be an increase in capital, and my answer is that I don't know to what extent there would be a corresponding increase in capital. Offhand, I think there would be some, but how much it would be, I don't know, because that would be a line of inquiry different from what I have shown here.

I think that it would involve an additional amount of 1624 capital cost and an additional operating cost. I don't think there is any doubt about it. Increased volume would be most costly, other things being equal. They would have to buy 22 percent more gas, that is true. The figures here dealt with gross revenue.

On the right hand part of the page, without stopping to adjust those final figures there in 1938 to the final figures in Exhibit 179, it appears that the trend of the average annual revenue per M. C. F. has been downward, so far as the total is concerned. It has been upward for domestic and downward for all other class of sales.

In the electric business, the consumption per customer has increased. The average annual revenue per kilowatt has decreased, of course. The average annual gas sales have decreased slightly from 1929. There has been considerable fluctuation in the interim. In 1938, it was 170.7 as against 173.7 in 1929. The year 1938 was generally an off year for gas utilities; not only for gas utilities, but for businesses generally. It was considerably under 1937.

The next column to the right, captioned, "Average Annual Gas Sales Per Customer" for domestic gas, shows a decrease from 62.5 in 1929 to 53.6 in 1938. Domestic is the highest priced gas. That is universally true.

The average revenue per customer has decreased from $65.97 in 1929 to $59.64 in 1938. Of course, the figure for 1937 was higher and I am not sure that 1938 is a proper figure to use for the purposes of this comparison. I believe the 1939 figure will be more in line with the 1937. The domestic was $41.65 for 1929 and $37.52 in 1938, about 11 percent higher in 1929 than in 1938. The average domestic consumer in the United States was paying about $3 a month for his gas in 1938. I don't know whether the average revenue per customer in the electric industry, electric utility and distribution business, has fallen off or increased as between those two years. The figures are available. They are published, I think, by the Edison Electric Institute.

You asked whether or not they have increased or decreased on the basis of revenue per customer. We have two factors. We have clearly an increase in the kilowatt hour sales, and we have a decrease in rates. I don't know what the net effect is. I would guess that the effect is an increased total bill; but it is an easy matter to verify. If anyone has a bulletin of the Edison Electric Institute they can get the exact figures and clear up the matter at once. I didn't think you were going along that line of inquiry or I certainly would have had it with me.

You asked whether I think that the trends reflected by my Schedule 1, whereby the volume of gas sold, which in turn must also be bought, and the number of customers served, has increased by more than twice the ratio of the increase in the gross revenues, is a healthy trend over that period of 1929 to 1938. Part of it is healthy and part of it is not. The increased number of customers is a pretty good sign. The street railways would like to have an increased number in customers, for instance. The falling off in the consumption per customer, of course, is an unhealthy sign. Yes, generally speaking, the street railway gets just as much from one customer as it does from another. The revenue per customer does not vary a great deal to offset the increase in the number of customers.
1625 Although an increased number of customers coming at the time of the peak is a pretty expensive thing for the street railway industry. That is because of the additional equipment it must have. An increase in the number of customers, if it were in the off-hours, would be more than welcomed by the street railways. At other times, an increase in the peak load would be expensive.

You asked what else I can see that looks healthy, except the increase in the number of customers that have to be connected up and served in order to get this 11 percent increase in revenue. The exhibit shows that the business is not a moribund business. Revenues are not going off. The revenues are actually increasing. That is a pretty healthy sign. That is a good sign. It has not increased proportionately. I don't think you ought to expect it to increase proportionately, for an industry as old as the gas distribution industry, an industry which, I believe, started in 1816. In other words, you would not expect the same rapid growth after 100 years' experience or so as you would for the electric industry, which is a new industry. I dare say 100 years from now, or 50 years from now, that the growth in consumption of kilowatt hours will likewise fall off on a percentage basis.

You asked if the natural gas industry is rather new to a lot of people right now. The natural gas industry and the pipeline industry are quite new, and I think it is a little different from what we have here. It is true that these natural gas pipelines have taken gas for the first time to hundreds and hundreds of cities, and I think it is on the increase. I think it will be patterned somewhat after the experience of electric utilities.

You asked what has been the trend in the manufactured gas industry as to domestic consumption and revenue per customer from the distribution of artificial gas or manufactured gas. I don't know. I know that it has been put in evidence in this case, but I can't recall the figures offhand. It is my understanding, as a matter of common knowledge, that they have fallen off. When I mentioned the fact that the gas business was about 100 years old, I was talking about the gas distribution business. The present users of natural gas have not been using natural gas for 100 years. You cannot apply that 100-year observation to the natural gas business in many hundreds of towns in the United States. That is exactly the point I wanted to make. The point is that the natural gas pipeline industry is a relatively new industry. I am afraid if you apply standards derived from the manufactured gas industry, which is 100 years old, that you will be misled.

It is true that Schedule 1, which has to do with this new industry, this natural gas industry, also shows that since 1929, a perceptible falling off per customer has been experienced in commercial consumption and in commercial revenue; but they also show an increase of total revenue, which is a very important figure. I don't know by how many the distribution companies have increased in order to reflect that increase in revenue from 376 to 419 million dollars; but I imagine the distribution companies have increased substantially as far as natural gas distribution is concerned, and I think many hundreds of towns have been added to the picture.

1626 Turning to the page of Schedule 2 in my Exhibit 186, the reason I did not include the year 1938 in that schedule was that those figures have been published since the exhibit was prepared. They ought to be considered. The figure showing net income available for dividends and surplus for 1938, according to Exhibit 179, is $62,399,000. The fixed capital for that year was $2,441,840,000. There is a falling off then of more than $12,000,000 in net revenue available for dividends, with an increase in the fixed capital figure of $27,000,000. By fixed capital I mean investment in plant. It has nothing to do with the sum total of the securities issued or with the surplus. It relates to investment in distribution properties and lines, pipes, compressor stations, and so forth, per books.

You asked whether or not that would be the original cost or the adjusted value originally charged to plant account and less reserves set up. As an accountant, I cannot answer that question, because when you mix original cost and adjusted value it covers anything in the universe. It covers a lot of book figures.

Redirect Examination Interposed by Mr. Slaff.

It would save the Federal Power Commission and me a lot of headache if they would do away with original cost and adjusted value.

Cross-Examination by Mr. Morgan Resumed.

The figure includes the original cost as reflected per books, with no reduction for depreciation. It is the gross figures of the plant account. I am referring to the figures from 1934 to 1937.

Redirect Examination Interposed by Mr. Slaff.

Since the figures for 1938 should be taken into consideration, the figures for 1939 should also be considered. Of course, you should consider the most recent information available.

Cross-Examination by Mr. Morgan Resumed.

We can't go back and compare fixed capital in 1938 with fixed capital in 1929, as we did the data dealt with in Schedule 1. We do not have the information. At least, I do not have it, and I could not find it. It is my impression that there is no available information.

From 1931 to 1937 the operating expenses have increased substantially; namely, from $284,000,000 in round figures to $335,000,000 in round figures. During that same period taxes have increased from $29,800,000 in round figures to $41,100,000 in round figures. That represents an increase of about one-third. Profits went up during that time, available for dividends and surplus, about 50 per cent. If you go back though, from 1938 to 1931, the increase for net available for dividends was a much smaller percentage, roughly about 25 per cent; while the taxes went up 33 per cent. The comparisons should be made with the most recently available figures.

You asked why the revenues for manufactured gas for the years 1929, 1937, and 1938 are in so much straighter lines as plotted here on Chart 1 than the revenues of the total gas industry or from natural gas. I believe it must be due to the larger amount of natural gas used for
1627 heating purposes. Artificial gas is confined more nearly to the kitchen. People will eat at all times of the year. There is a marked seasonal fluctuation, both in the revenues and in the volume consumed, of the natural gas. That is shown also in Chart 2.

In Chart No. 3 the broken line, which has been labelled "Industrial Activity" is the volumetric quantity. The quantities are stated in terms of products and not of dollars. I think that is true also of manufactured and natural gas sales. I feel sure that the person compiling this would not make such a grievous error as not to have them on the same basis. You can't compare dollars with volume. I took that chart from some American Gas Association publication. I noted there that the term "natural gas sales" was qualified to include domestic and commercial sales.

You asked whether I would expect the curve to run in the same direction if it were confined to gas sold for industrial uses. I have anticipated that question in reviewing these charts for the purpose of getting ready for cross-examination; and I am prepared to give you pretty generally the way the curve would look if it included industrial sales. It would be different if confined to industrial sales. If another curve were superimposed here which dealt with gas used for industrial fuel only, the course of that curve would be different. There is a wide variation in the volume of gas used for industrial purposes. The industrial index fluctuates more widely than the index of domestic and commercial sales; and reacts more directly to business conditions and to industrial production. It is termed a more sensitive index, to use a technical term.

1926 is the base year for this index. All three indices are chained together to 1926. You can tie these indices together for any one year. You can take 1910, 1905, or 1915, and they would be exactly in the same line when you tie them together. In other words, when you use a base year, you bring all that together. That is, you use that as a base year. Then they diverge from that point, either forward or backward. In 1926 I put them altogether but they did not stay together long. They began to diverge.

You asked what purpose I think this chart serves in this inquiry. It sheds a little light on the natural gas industry, particularly from an economic viewpoint. It shows that the natural gas industry is growing faster than the manufactured gas industry and has not been attended with the severe decline connected with industrial activity. I think it is a healthy sign, in other words. I don't know what accounts for the course of the curve. The curve shows there has been a growth in the volume. As to the underlying causes, I don't know whether I would be able to give them to you properly. If we were dealing with only the natural gas companies that were in business in 1926, and we were tracing the volume of the business of the particular companies who were in business in 1926, the curve would not take exactly the same course; but that would not be a proper curve. I don't think it would even if you were dealing with the companies which were in existence at that time. As far as the economic situation is concerned, it might be far from the truth. It is like taking one store and saying that is an index of department stores generally. It might not be so. You have got to include the entire industry to get a proper perspective.

You asked if going to the question of stability, we ought to be dealing with the particular companies that 1628 were in business in 1926, to see how stable they have remained. If you are dealing with particular companies, yes, but if you are dealing with the industry, no. The stability of the industry means in an economic sense whether the industry is expanding or whether it is moribund. As to the title, I would like to say that the title was not selected by me. It is copied from the publication of the Gas Association and it is a correct portrayal—whoever devised these graphs did a good job of showing, as far as the industry is concerned, a picture of its growth and development.

The chart itself shows that the conditions have not remained the same in the industrial field and in the manufactured gas field and in the natural gas field, over the period the chart covers. It shows that the volume of gas handled has changed. That is an important feature. I cannot go along with you in the idea of taking one business or company or two or three companies and tracing them. You will find as far as the electric business is concerned, that the electric business I look upon as a very healthy business generally. However, as far as some individual companies are concerned, the reverse is true.

You asked how much new capital has been put into industrial enterprises, not including the natural gas pipeline companies, from the year 1926 down to the present time. A great deal of capital was put into industrial enterprises between 1926 and 1929. Since that time there has been very little capital flowing to any business. The curve of industrial production since 1929, when the downward trend starts, is dealing with the production of capital as it existed in 1929. In the natural gas business, more capital has been put in. However, to continue the comparison, if you had put more capital into industrial activities, the picture would have been even worse than is shown here. The industry in general could not absorb any more capital. The gas business did absorb more capital, particularly the pipeline companies. If the other industries had put more capital into production facilities, they could have produced more, but they would not have, and the picture would have been far worse than it is. In other words, if the industries in general had expanded their plant, the picture would have been very bad, because expansion was one of the difficulties I think we faced in 1929, and further expansion would have been awful. You know what happened after 1929. Large amounts of plant were shut off, reorganizations took place in order to get fixed charges down, depreciation and things of that nature. Just the reverse of what you are indicating.

Questions Interposed by the Examiner.

That would not have affected the dotted curve, but if you relate this to capital, then the picture would have been much worse than shown here. There has been an expansion of industrial goods during the period.

Cross-Examination by Mr. Morgan Resumed.

I am not talking about return now. I am talking about industrial production related to capacity. The industrial curve reflects nothing as to its relation to the actual conditions. It does not indicate anything as to any particular branch of industry.

1629 You asked how many pipelines have been built in this coutnry since 1926. I would say most of the large lines. I don't know whether the New York State Natural was built since 1926. I don't have the dates that the lines were built. I know that a substantial volume of pipeline construction was taking place during that period, as shown particularly in the Federal Trade Commission reports, and that is the source of my information. I am not in position to name dates for any company, except perhaps the companies involved in this proceeding. I know there is such a company as the New York State Natural. I know we are investigating it at the present time. I have a staff of men on the job. That line, I will say, was built since 1926, generally speaking.

I don't know when the Mountain Fuel Supply Company's line was built. It is at Salt Lake City and has long transmission lines. It produces in Wyoming, Colorado, and Utah and has transmission lines going from Colorado, Wyoming, to Salt Lake City and Ogden, approximately 442 miles of 16-inch and 18-inch pipe transmission lines. I don't think that line was built prior to

1926, and, generally speaking, most of these lines were built since 1926. You find a chart here which was intended, or, rather, Schedule 3, shows the importance of the interstate movement of natural gas from 1926 to 1937. Generally speaking, I think that answers your question. I want to agree with you, but I can't give specific years or periods, because I don't know.

I don't know when the Montana-Dakota Utilities line was built.

I don't know when the Pacific Gas and Electric Company's transmission line was built.

I don't know when the Stan-Pac line in California was built. I don't know whether it was built since 1926 or not.

My answer is the same as to the Southern Fuel Supply Company's line.

I know the Montana Power Company acquired its line after 1926, but I don't know when it was built.

My answer is the same as to the Houston Gulf Gas Company's line.

The Canadian River Gas Company's line was built since 1926.

I don't know about the Lone Star Gas Company's line out of the Texas Panhandle, or the Northern Texas Utilities' line out of that field.

I don't know about the Arkansas Louisiana, but it built a large extension since 1926.

I don't know when the West Texas line from the Amarillo field down to Lubbock and other south plains cities of Texas, part of the Canadian River group, was built.

I wish I knew; I would be glad to answer if I did, but I can say that I know that there has been a large increase in pipelines since 1926. I am not able at this time to identify the lines.

1630 I don't know when the Colorado Gas and Fuel Company, from the Hugoton field, was built.

We have the rates filed of several hundred companies. I could not possibly carry them in my mind. That is one of the unfortunate circumstances of holding the hearings in Chicago. I could answer the question in a few minutes back in Washington, if I had my papers.

I don't know when the Kansas Pipeline and Gas Company built its two lines.

I know a good deal about the Interstate Pipeline Company, but I don't know the year of the construction of the line.

I don't know when the Memphis Natural was built, or the Consolidated.

I think the Michigan Transmission was built since 1926.

I don't know when the Cities Service line out of the Texas Panhandle was built. I believe the Northern Natural and the Southern Natural were built since 1926.

I am afraid to answer as to the Panhandle Eastern. I think it has been since 1926, but I cannot tie my reasoning down to any particular point. My recollection is that all of the pipelines out of the Panhandle have been built since 1926.

I don't know with reference to the El Paso Natural or the Mississippi Fuel.

Part of the Columbia Seaboard line over on the east coast was built since 1926, I know.

I think Colorado Interstate was built since 1926.

The pipelines just named represent a large proportion of the total pipeline outlets for natural gas in the whole country. And, of course, you should include the two companies involved in this proceeding. As to why they should be included, since only the gas sold [illegible] natural gas distributing companies west of Chicago would be included on the chart, they, nevertheless, should be included because we have just said that all the pipelines just named provide a large proportion of the total pipeline outlets for natural gas.

If you remove from the volume of gas represented by that curve, from the year 1926 down to date, that which represents gas distributed in towns to which those pipelines named above took natural gas for the first time since 1926, you would have an entirely different curve. Under such circumstances, I assume the curve would follow pretty much the same as the manufactured gas curve. It would be an assumption, because when you eliminate all this increase in business and take the same companies I think it would follow along the general line of manufactured gas more than anything else we have on this chart.

I am not familiar with the bulletin of the United States Department of Interior called "Natural Gas", by F. S. Lott and G. R. Hopkins, chapter preprint from Minerals Year Book 1939, review of 1938, with final statistics for 1937, issued by the Bureau of Mines. You have handed me a document which meets the description you have just recited. You have asked me to read the first two paragraphs on the first page of that bulletin.

1631 "The natural gas industry experienced a moderate shrinkage in demand in 1938 after four years of rapid recovery from the depression low of 1933. Total marketed production had increased 55 percent from 1,555,000,000,000 cubic feet in 1933 to 2,408,000,000,000 in 1937. However, because of generally adverse business conditions in 1938, marketed production is estimated to have declined to 2,263,000,000,000 cubic feet or 6 percent below 1937.

"Capital expenditures in the production and transportation branches of the industry were much lower than in 1937, as existing facilities were generally adequate for the requirements of current markets. Since the period 1928-1932, when many long distance gas lines were constructed, managements have emphasized expanding the volume to utilize excess capacity and improving load factors, but at profitable rates. There appear to have been two restraining influences in the last two or three years upon the extension of pipelines to new markets. One is the activity in many localities of groups sponsoring competing fuels. The other is the stagnation of capital markets for durable goods, which has almost eliminated public financing as a means of raising money for new gas enterprises."

You asked whether I know what is meant by the observation in the statement I have just read that one of the two restraining influences in the last two or three years upon the extension of pipelines to new markets is the activity in many localities of groups sponsoring competing fuels. The only thing I know is that since the Natural Gas Act was passed there are certain groups that are advocating the use of coal in contradistinction to natural gas for industrial purposes.

You asked whether I am familiar with the fact that there are groups who are in favor of legislation requiring the use of coal for industrial purposes as opposed to natural gas. I am not familiar with anything specific along those lines. I know the coal associations generally are trying to do their utmost to expand the use of coal. We have a Bituminous Coal Commission which is deeply concerned with the economics of the coal industry, and we have had some legislation on the subject already, as a matter of fact; but as to how far they are going and what their specific recommendations are, I don't know.

I don't know about the bill which you say is now pending in Congress concerning which hearings are now being conducted, based on a report by a conservation committee headed by Frederick A. Delano, which was filed with the President and by the President transmitted to Congress, and in pursuance of which a bill has been introduced to set up a commission to exercise drastic powers over the usel of fuels in this country. I don't know that the groups who are interested in this question are advocating an enforced raise in the price of industrial gas to take it out of competition with coal.

The petitions that I have read from the coal interests have been to the effect that the Federal Power Commission should not grant a certificate of convenience, should not permit a natural gas company to invade certain markets or certain areas where coal is now being used for industrial purposes. I don't know anything specific on the organized activity in the interest of raising the prices of natural gas used for industrial purposes, since the enactment of the Natural Gas Act.

1632 I believe the railroads are another group who are sympathetic with the same activities. They naturally would be, of course. The railroads transport a great deal of coal and they don't want to lose that business.

I am familiar, generally speaking, with Moody's Manuals. That is a work from which my staff and I have drawn freely in preparing the statistical data used in this case. You have just read a paragraph from A-58, in the 2nd blue portion of that manual, captioned, "A Nation-Wide Survey of Public Utility Progress." The particular volume is Moody's Public Utility Manual for 1939, under the caption, "Domestic Consumption". The language you have read is as follows:

"The trend of domestic and commercial consumption combined has been steadily upward for the past decade, increasing 51 percent from 1919 to 1932, declining 4.5 percent in 1933, increasing 2.9 percent in 1934, 9.1 percent in 1935, 9 percent in 1936, and 7.5 percent in 1937. The gain in sales and revenues continued through most of the depression as a result of the extension of pipelines to densely populated areas which were previously served only by manufactured gas. The most notable examples were the Detroit line which connected the City of Detroit with the Texas Panhandle and the Hugoton Kansas fields and the

Chicago line which pipes gas from the Panhandle in Texas to the City of Chicago. In the latter case the gas is then mixed with the manufactured product and distributed throughout the entire city. While we have no figures indicating the experience of domestic sales, exclusive of business gained because of the extension of pipelines, figures from individual companies and individual states indicate declines in both sales and revenues were experienced during the depression. Per capita consumption by domestic and commercial users has dropped quite steadily as the number supplied with mixed gas has increased."

You asked whether I think those are reliable figures and observations. I can't answer the question as to those percentages. I would have to make the same study to verify them. I am willing to make the statement that Moody's Manuals are reliable in that connection, but as to that, the many percentages you have quoted, I just can't answer.

You asked if I would be willing to accept Moody's statement there that there would have been an actual falling off in those states and communities where natural gas was being served but for the added volume resulting from these pipeline extensions that are referred to as having occurred. I don't quite understand what you mean by falling off. Falling off in the manufactured gas, or the gas in general. It is awfully hard to follow what you have read at this distance, not having it before me.

(Counsel hands witness the volume.)

It is under the heading, "The Natural Gas Industry," shown on page A-55. A sub-heading, "Domestic Consumption" at A-58. The sentence I believe you want me to consider is: "While we have no figures indicating the experience of domestic sales, exclusive of business gained because of the extension of pipelines, figures from individual companies and individual states indicate declines in both sales and revenues were experienced during the depression." Well, I know of no reason why I
1633 shouldn't accept it, but I have not made such an
investigation as would enable me to verify the statement. I repeat my statement that generally Moody's is a reliable service. That is consistent with what I said in my statement that the curve showing the volume of domestic sales of natural gas would probably follow the same course as the artificial gas sales. The statement in Moody's is not directly in contradiction of the course of that surve.

Moody's statement says there has been a falling off for consumption of certain customer's in certain states, but it does not go to the total volume of natural gas distributed, which is contained on Chart 3. I think we are dealing with two different things.

In the statement, "While we have no figures indicating the experience of domestic sales, exclusive of business gained because of extension of pipelines, figures from individual companies and individual states indicate declines in both sales and revenues were experienced during the depression", nothing is said about customer consumption. It says both sales and revenues decreased during the depression. That is exactly what happened to manufactured gas. That is not talking about customer sales.

I do not wish to modify my answer in any respect or my comments on this curve in any respect in the light of what Moody says about this.

No, I did not take the pains to go back and check the data which I took from Moody's and used in Exhibit 186 and in Exhibit 185, which was also prepared under my direction. That statement would not be entitled to just as much authenticity as would the figures we used. This is a different kind of study. You know, Moody qualifies his statement there considerably. He refers to the absence of data. He refers to a survey made of some companies in some states. It is greatly qualified. It is far different from the financial figures which are given, such as the ratings of stocks and bonds, which is an absolute fact; the market price of which is an absolute fact. I mean, there is much more reliability to those matters contained in Moody's Manuals than there is to Moody's conclusions as to a survey of a business. I mean, they are different things. No, I am not saying I would want to go back and check this before I made the statement. I said, generally speaking, I would accept Moody's. I repeat this, but I said the statements are not entitled to the weight the financial material is generally entitled to and generally receives.

If I were to plat on that same chart there or a similar chart a curve showing the volumetric production of the air-conditioning industry, sales of air-conditioning equipment, and so on, I think such a curve would be indicative of the stability of this business as compared with industry in general. I know that the sale of that sort of equipment has had a distinct rise, but you said compared to industry in general. It would give the best comparison I could possibly have as to industry. After all, you have to have some standard, some yardstick. We have a yardstick of industry in general and we have air-conditioning applied alongside of industry in general. As far as comparison between the two, I don't think I know of anything you could get which would be better over the period of time covered by the chart, whatever it might be.

1634 I think the fact that this line ran in an upward direction far above the curve of the industry in general would indicate that as compared with business in general the air-conditioning business was a very healthy business. Of course, now, for stability you have to have a long period. You can compare the two and tell whether the air-conditioning business is more stable than industry in general very easily if you have a sufficient number of years. I think the chart here in 1905 and 1940 would be ample by any stretch of the imagination. I do not think 1926 to 1938 would be sufficient for the air-conditioning industry. I don't think it is sufficient for the natural gas industry; but I think it is probably the best period you could get for that industry. It is the only period we have so far as the main bulk of it is concerned. But you can in that short period of years determine the stability of that industry by comparing the volume that is handled through a lot of new pipelines which were constructed with industry which was in the throes of the worst depression the country ever had for a reasonable period of the future; not for a long period, of course.

Yes, I know that industry during the period covered by this curve, since 1929, has been in the worst depression it has ever known. I know that the natural gas business has been largely built during that period, and that makes me appreciate the natural gas business very much. I think it is a splendid thing for the natural gas industry. I am referring to its growth in a period of depression, when everything else was going down, the natural gas business went up. Its stability over a long period of years can not be thus demonstrated. The reasonable period in the future can be judged from wealth in the present and nothing else. The present is the best indication of the future that you can get.

Schedule No. 3 was given for the purpose of showing the importance of the natural gas in interstate commerce as a commodity of interstate commerce, and also indicates that a great deal of the natural gas industry, from the passage of the Natural Gas Act, will be subject to regulation. Originally, I believe the purpose of the exhibit was to use it in connection with the proposed legislation setting up the Natural Gas Act, although I have used it here for a different purpose. I had nothing to do with the passage of the Natural Gas Act, of course. The original purpose of the exhibit might have been to contribute toward the enactment of the Natural Gas Act but it has more pertinence than that. I think it gives a very good picture of the importance of natural gas as a commodity of interstate commerce, and I think it is important for us to realize the effect of regulation on the natural gas business. You asked whether it shows anything about the effect of regulation. It will show that a great deal of the natural gas business will be brought under regulation. I think it is important to know that fact. It shows natural gas consumption in Column C, which is an important figure.

When I was on the stand before you asked me if I knew what two states had quit producing natural gas between the interval of 1930 and 1931. Those two states which were dropped from the column as between those two years were Iowa and North Dakota. The reason they were dropped was that the total production of both Iowa and North Dakota was only about 100,000 M. C. F. per year. They never did produce very much, as far as I can learn; but whatever they were producing they must have quit, or they wouldn't have been dropped. They got to such
1635 a low point so that it was no longer of any consequence. 100,000,000 cubic feet would not be of very much importance in that industry as a whole. That is not an unusual thing to have happen to a gas field. I think it is one of the natural characteristics of a natural gas field, to become exhausted sometime. They always quit sooner or later.

Schedule No. 4, for the years 1928 to 1937, shows the natural gas transported to the State of Illinois. I think that refers to the gas that is brought into Illinois and there distributed. In other words, it does not include gas which goes through the state in a pipeline. I don't know as to the particular importance of that in arriving at a proper rate of return. I thought it shed a little economic light on this question. I don't attach a great deal of importance to the schedule. However, if I left it out, more than likely someone would ask to have it put in, and that is why so many of these things are put in there. I have had a great deal of experience in testifying as to rate of return, and I try to anticipate these things.

You asked if I thought you might have asked me to put it in. I thought you might have asked me about the gas which comes into the State of Illinois. I thought it might be of interest. I have had questions by examiners and others relating to information similar to this. I think it is a picture of gas which goes into Illinois and where it comes from.

I have included in this exhibit special charts or schedules at the suggestion of members of my staff. I don't think of anyone else who has made such suggestions.

I recognize that the revenues to natural gas pipeline companies selling at the city gate at wholesale are not included in the figures shown in Schedule No. 1. These are only the figures pertaining to distribution companies. I do not have available figures which would show the same character of information for natural gas pipeline companies selling gas at wholesale at the city gate. I would refer you again to Schedule 3, Column C, which is the nearest approach to that problem I could get. I think those figures include the total consumption of natural gas. I think it includes all natural gas and not just those companies whose purchasers distribute natural gas alone to the exclusion of mixed gas.

Schedule No. 3 does not give the figures as to revenues. It deals with volumes. I say that is the nearest approach I can get in answer to your question. We have filed with us the total quantities of gas that are sold by these pipelines at the city gate and total revenues received from the sale of that gas for one period; namely, June 30, 1938. We expect starting from that date on to compile statistics of the kind you mention. We aren't in this long enough to have as yet reliable statistics. We know the price prevailing today of all those transactions which are interstate commerce, including all of those who are transporting gas in interstate commerce from the Texas Panhandle field. I have made no comparison of the prices received by the other companies which are transporting gas from the Texas Panhandle field to the prices now being charged by defendants. I don't know whether they are higher or lower. I think that comparison is one of the things to be considered by the Commission in adjusting rates. I don't think it has

anything to do with the rate of return specifically. This is an effort to regulate the rate rather than the rate of return. I am not sure I am the witness to give you the information. I certainly think a complete rate case includes a good deal of information about the price of
1636 gas. I have no doubt in due course information of that nature will be presented. We have the information if you want to compile it in schedule form. It is a pretty difficult job with a small staff.

Returning to Chart No. 3, it appears there that, throughout the year, there is greater fluctuation in domestic than there is in industrial and commercial use of gas. Over a period of years domestic is more stable. As a matter of fact, these uses to which gas is put for domestic and commercial purposes go on when times are good and when they are bad. The curve showing the volume of gas used for domestic and commercial purposes is the least sensitive to business conditions, because people will eat and the hotels and restaurants will cook and serve food even if times are not so good.

The industrial curve is very sensitive to business conditions. You asked if in that sense it is not rather difficult to draw a conclusion from the course of the curve showing total volume of gas used for domestic and commercial purposes in comparison with the curve showing the course of industrial production during a period of extreme business depression.

This morning I tried to correct that by showing you how the trend of the total volume of gas, including natural gas and industrial, went from 1929, the last year before the depression. I will give it now if you want it. Chaining all of them together, 1929, that is, the natural gas, domestic, commercial, and industrial, because that was the last year before the depression, then if we include the industrial volume with domestic and commercial, we find in 1930, 1931, and 1932 the trend went downward reaching a low point of about 108 in 1932; it was almost the same for 1933, then it shot straight upward, reaching a figure of 165 in 1937, much higher than the manufactured gas index, a much higher figure than the industrial activity index, a much higher figure than the natural gas index of domestic and commercial sales.

There isn't any question that there is a greater volume of natural gas being handled in this country than there is artificial gas. As a matter of fact the trend also was upward. The curve represents the volume and trend. A curve is given for the purpose of showing trend over a period of years. It is based on the volume of sales for the industry. I think by chaining it together in 1930 and using an index we make a correct comparison. This is an index as we have computed it, and not the absolute volume.

You asked if I think it is unsafe to use a curve showing the total volume of gas sold for domestic and commercial purposes, which I have stated is liable to be more stable during the year than industrial gas even, and to compare that with the curve of industrial production, during the period of the depression. I don't think so. Certainly the compilers of the chart didn't think so or they never would have put it out. I think it is a proper comparison.

Going to Schedule No. 5, I have included in that schedule a list of 31 companies. I have selected those companies for this list on a basis of two characteristics, one in the alternative. They had to be either transmission and production companies or transmission or production companies, one or the other, and to have an annual gross or net revenue of two and a half million dollars.
1637 That isn't quite accurate. In other words, they had to have production and transmission, or transmission without production. I excluded those which had production without transmission. I included all of the pipeline companies in the country which had those common characteristics that we could get except a few companies which were predominately engaged in some other business and which had some pipelines but whose securities we thought would not be in the same class as the securities of the companies I have listed here. I may mention Pacific Gas and Electric, the Montana-Dakota Utilities which you mentioned this morning. The Montana Power Company has some transmission of natural gas.

You asked if Montana-Dakota Utilities has most of its assets tied up in natural gas operations. Not to my knowledge, but I am not sure. My dealing with this company thus far has been in connection with the electric business. I am not prepared to say at this time what proportion of its business is natural gas, if we have a record of the proportion. We did not have any information which was available, but in the nature of its business I know it does have substantial electric business. It is written up in

Moody's Manual. I think it had a lot of difficulty about some financing a few years ago.

These companies all have those common characteristics I have mentioned. There are two of them which, upon reconsideration, we probably ought to eliminate. One of them I mentioned at the time I gave my direct testimony; namely, the South Penn Oil Company, and one that I think was referred to as being one of the largest natural gas companies east of the Mississippi River. Subsequent investigation on my part discloses that it is primarily an oil company; and the oil business is so large in comparison with the natural gas business, I think we ought to exclude it. That company has a very large percentage of its total revenue from oil. You will recall I had some question about that at the time I gave my direct testimony. The other company is the Indian Territory Illuminating Company. I don't think that that one should have been included because I don't think it has any transmission to speak of. It has gathering lines and sells its gas in the field. It is a production company, producing in 50 Oklahoma fields and several fields in the Texas Panhandle. It sells to 12 utilities at various points in Oklahoma and to three utilities at various points in Texas. While it does have gathering lines, I don't think it has any transmission to speak of. It has some oil business also.

On Schedule 5-A, I have listed here only seven companies. I show in that schedule all the bonds which were held by the public of the 31 companies shown in Schedule 5. Then we give the market values for those particular bonds, debentures, and notes, wherever I could obtain a market quotation. Those seven constitute the group, out of the 31 companies listed in Schedule 5, that have bonds outstanding in the hands of the public.

The Houston-Gulf Gas Company produces gas in Texas, and it purchases gas from 12 companies and individuals operating in six Texas counties. It sells gas for industrial use, and has a pipeline extending from the fields in south Texas to Houston, Texas; 482 miles of line. It sells all or a substantial amount of natural gas requirements to 18 communities, including the City of Houston. It produces gas in five Texas fields, according to its report to the Federal Power Commission. I don't know whether these five fields are in different counties. That company is
1638 part of the group of companies known as the United Gas Corporation and it is one of the Bond and Share

companies. The United system produces gas in a great many fields in Texas, Oklahoma and Louisiana. I think the Houston-Gulf Gas Company is tied into the system. You asked if in case of an emergency it would have access to the reserves back of the whole system. It buys most of its gas today, and does not produce it. I think it buys it largely from the United and other members of that system.

The $4,238,000 of First and Collateral Six Percent Mortgage Bonds, maturing in 1943, are undoubtedly senior to the Debentures, due at the same time. In showing there the times fixed charges earned in 1938 these senior bonds are grouped with the debentures. We would get a different result if we were to calculate the times interest on the First Mortgage Bonds. I wish we had the figure. We could not get it at the time this figure was prepared. We had the earnings and the income statement. We took the total interest requirements and that was covered 1.30 times. We did not have the interest in the income statement broken down. There may be some difference between the interest in the income statement and the interest on these particular items. It is simple enough to calculate interest on $4,238,000 at 6 percent if those bonds were outstanding in that amount all the year. This 1.30 does not apply to the First Mortgage Bonds; it applies to the two issues, and we show that very clearly.

A purchaser interested in buying some of those First Mortgage Bonds would concern himself about the coverage for the First Mortgage Bonds only. He would be interested in stuying the general financial structure of the company. I did not prepare this part of the exhibit. It was prepared by others under my direction.

You asked if I am sure I did not have available the amount of the interest on the issue of First Mortgage Bonds. In the report which they prepared for me, they did not show it; and I assume it was not available, because in other cases they have shown that information.

You have handed me Moody's Public Utilities Manual for 1939, which has been mentioned before. It gives on page 2073 the times charges earned as 1.30, the same as we have shown on this chart. The point I make is that to be sure of your figures you just can't take these figures here and make a computation. We have the debentures here. But, you get other interest deductions of $220,000. These bonds may not have been sold at par; they may have been sold at a discount. The effective rate may be far different from the six percent. As soon as you try to interpret this kind of a situation, dealing with those figures, you may go astray, and you may go astray badly. Moody shows the times charges earned. That is exactly what we show in this schedule. I am not sure that the data is there from which you can find the times interest earned on the particular issue, because we have other interest charges there which amount to $220,000. I don't know what they are, I don't know how they rank. That is in addition to the debenture interest of $120,000. They may be prior, they may be afterwards; but there is nothing there on which you could make any assumptions to arrive at any other figure than the 1.30, which we show. The investor would more than likely try to get the correct information from some source. He would be foolish if he made any interim calculation based on that calculation.

1639 Moody lists the bond interest right here in so many words, but you can't tell what the bond interest includes; interest on this and what? It does not give the effective rate of interest. The latter must take into consideration any discount. Again, which is more important, it shows $220,000 of interest in that statement which I can't classify. You can assume that interest comes after the bond interest, but that will be an assumption. As an accountant I would not make a computation such as you asked for and certify to it because there would be too much guess work involved.

You asked if I can't turn over to the second page and see exactly what it is. Not to my knowledge. I would be glad to look if you will hand me the record. (Document handed to the witness.) This gives the details as to the bonds outstanding; outstanding Series A at the end of the year, $4,238,000; retired, $6,672,000; and gives the date, April 1, 1930, and due interest date, and describes the sinking fund provisions, and so forth. That is not the information which I would need to make a statement and certify to it as correct.

I would say if any member of my staff did that, he would be wrong, as Moody would be wrong, instead of doing it as contained in the statement you have shown me. He didn't do it, Moody didn't do it; and undoubtedly Moody had a great deal more information on the subject than set forth in the data here. Yes, Moody stated the earnings here. Ordinarily, the bond interest does not include amortization of debt. It is described here as interest; but in the income statement amortization is included. That is what I am afraid of. No, I can't take the information here and figure out the earnings times bond interest. You gave me an income statement to review, and you asked me to figure the interest in the income statement. I asked you if you can tell me if there is any amortization in that account. If you can't tell me, I would not know. All I can do is to follow Moody's method and arrive at 1.30; and with the qualifications I have mentioned the best it will show is that as to the First Mortgage Bonds, as far as the First Mortgage Bonds are concerned, that is times interest earned on those bonds. I have not shown that.

You asked if anybody who knows enough about it can take these figures and tell what the earnings times interest on the bonds would amount to. I can give you an answer, if you are willing that I should make certain assumptions. Since you say you do not want me to assume anything, I can't do it. I must refuse to do it because it would be unprofessional for a man of my reputation to do anything like that. I have certified to many statements in my accounting career, but I can't certify to anything like that without making some assumptions.

I would have to assume that the interest shown there is all interest on the bonds, no amortization; that the interest is on the bonds outstanding all the year, and solely on the First Mortgage Bonds; and none of the other interests shown in that statement comes ahead of the interests on the First Mortgage Bonds. You suggest that the volume shows exactly what I say I have to assume. It does not show that at all. It does not show it for the $220,000 interest. It shows it to be bond interest. It says bond interest, debenture interest and other interest. It would be an easy matter for me to make that assumption. If you will tell me that is correct, I will accept your word for it for the purpose of the computation, but I can't say it is correct.

1640 This is the statement for the year 1938: Gross income, $770,143; that the bond interest was $254,280. Assume that that represents the bond interest on the bonds which Mr. Morgan referred to, and assume that all the other interests of $340,000 properly come after that bond interest, and assume that there is no discount in that figure of bond interest; then the bond interest was earned slightly over three times. It was earned 2.54 times. Yes, that is very different from 1.30, but I never said that the 1.30 was the earnings on these bonds. I resent any implication that I made any suggestion of that nature. I can't do any more than to emphasize my statement that it is more important to the man who wants to buy a bond to know what the earnings times bond interest are.

In the next column we show the percent of funded debt to capitalization, December 31, 1938. It includes indebtedness at the end of the year, what is commonly known as long-term debt. In that case it would include bonds and indentures, and income notes, if any such were outstanding.

First going to the quality of those First Mortgage Bonds, the important thing is to know what percentage of the total investment was represented by those bonds. That is true if we are dealing with the bonds alone.

You asked whether in appraising the bonds from the standpoint of an investor who you say is interested in getting his interest, and who is concerned about the percent of indebtedness represented by the issue of bonds and about the earnings times interest on the whole issue, he would not have to have the percent of the total investment represented by the issue of bonds as well as the earnings times interest. No, he would have to have the relationship of the funded debt to plant or total securities outstanding in order to rate the bond, compute the yield, or anything like that. In other words, he would want all the characteristics of a bond which Moody takes into consideration in rating bonds; that is, the ratio of the bonds to plant, or ratio of bonds to outstanding securities. An investor would want to know that in passing upon the quality of the bond and in determining how much he is willing to pay for it. It is true that earnings times interest and the percentage of total investment represented by the issue in which the bond falls would enter largely into what he is willing to pay for it; but they are both relative to other facts. The are both mighty important points to be considered by any investor. Neither one of them is shown on this exhibit. The ratio of First Mortgage Bonds to plant, per books, the gross plant, without the deduction of the reserves, is roughly 25 percent.

I wouldn't say that the investors who bought the bonds at the quotation I used in computing the yield required a

yield of 5.13 at the time they bought them. That is the yield they got; bearing in mind that the bond was selling at that time above the call price, which is always a factor to be considered very seriously; because that bond could be called at 101½; and the investor might lose right off the bat if he paid 103 for the bond. That was the yield that was in the prospectus and was based on the 1938 earnings. I used the 1938 earnings because you use the most recent earnings when you take a market value as of a recent time; and 1938 was the most recent earnings which we had for which we could get comparable figures. This exhibit was prepared about September 30, 1939. I don't know that the earnings for a large part of 1939 were then available
1641 able and published in sufficient detail. Yes, I note that Mr. Knapp in his computation in the last two exhibits brought in here did use very recent information concerning earnings for 1939 in making up his exhibit. They were four electric utilities; and those statements he compiled after the direct testimony in this case. And then again, there is something else which I ought to mention here, and that is that a part of this exhibit, and undoubtedly a large part of it, was compiled before September 30. What we did was to compile the exhibit as far as we could go, and at the last day, before getting ready to have the exhibit reproduced, we put in the computation for that date.

I am not prepared to say that the man or men who bought the bond or bonds involved in the transactions on September 30, 1939 had published information available to him, showing the earnings down to a comparatively recent date. It is true that business in general has had a considerable step-up so far as earnings are concerned in 1939 over 1938, and I think I testified to that effect. If I had used the 1939 earnings, I would not have set up a higher yield when the bond is selling about call price. I stated on direct what the call features of the bonds were that were shown on Schedule 5-A. As to the bonds shown here, it would not make any difference in the yield shown. The yield we show here is the actual yield, based wholly upon market prices of September 30.

When it comes to the earnings price ratio you are talking about common stock undoubtedly, not bonds. This 1.3 times interest earned has to do with the fixed charges. If it be confined to the interest on the prior issue of bonds and on the indentures, the ratio would be higher but I can not say that that would be the correct thing to do. If it had been the correct thing to do, Moody would have done it that way. The very fact that Moody did not show it indicates to me that there must be some reason for the failure to show it that way, because the information is important. I think that that emphasizes the reason why they show it that way.

You asked if it does not show the debenture interest in plain words. It shows the total fixed charges earned, 1.30, and it also shows the interest on the debentures and the interest on the bonds. And using the same assumptions that I made in calculating the ratio of earnings to the interest on the bonds, I could find the ratio of earnings to interest on both issues. It would be over two times. That is with all the assumptions which I have previously stated.

If I computed the total percentage of the fixed capital represented by the two issues instead of by all of the funded debt, I would get a lower percentage than 43.8. I would get about 33⅓ percent. And with more than two times coverage of interest on that issue and prior issues, and only one-third proportion of the entire capital represented by the two issues, these debentures sold for a yield of 5.9. That is true with the qualifications I have given. The market price on September 30 was sufficient to yield 5.9 to maturity. These debentures were selling above the call price. These debentures sold for 102 and the call price was 101½.

Passing to the Oklahoma Natural Gas Company, First Mortgage Bonds, three and three-quarter, 1955, sold in August, 1939, the total outstanding was $17,000,000 all sold to the public. No, I do not know what the earnings times interest on that issue are. I would not know unless I had
a pro forma balance sheet prepared to show all the
1642 facts, because being issued in 1939 the most we can
show is times fixed charges in 1938. I would not calculate a pro forma balance sheet from such information as is given in the prospectus filed with the S.E.C. I will accept it, but I would not make a calculation on it. Bear in mind that the pro forma balance sheet has been condemned by itself because of abuses during the 1920's. The American Institute of Accountants has warned all accountants to be most cautious in preparing anything of that nature. If we had the figures I might accept them, but I would not certify to them. It has to be upon a pro forma basis be-

cause it deals with the future and dissemination of things in the past. You have to be on the ground floor in order to make a proper kind of study and to be sure you are right.

You asked if in getting down to earnings as applied to First Mortgage Bonds, we are not dealing with the first call on those earnings. My answer is, sometimes, and sometimes not. There may be senior securities underlying those securities frequently. I don't think there are in this case. I don't think it is true in this case, but there are cases in which it would be true. Yes, they might be First Mortgage Bonds and still have senior securities. For instance, in railroad financing First Mortgage Bonds are frequently subject to senior securities, subject to what we call underliers, which are senior on certain properties and on certain earnings, as especially in the case of mergers.

They are First Mortgage as to the earnings of the particular company who issued the First Mortgage or some predecessor. It may be a predecessor, especially in the railroad business. It might not be a First Mortgage Bond with a superior indebtedness standing ahead of it, but it might be called a First Mortgage Bond with underliers standing ahead of it. I have found that situation many, many times in my dealings with financial affairs. I have found First Mortgage Bonds with a superior indebtedness ahead of them; for example, First Mortgage Bonds in railroads, with underliers ahead of them on specific property and specific earnings, many times. That is not an unusual thing at all.

In order to find out what the earnings times interest is and what the percentage of coverage in the matter of property concerned is, first, I will study the statements in the prospectus. After that I would get the proper information from such reports as are filed with the Federal Power Commission. When these reports come in I can make the calculations easily. This is the first year, 1939, and anything we can find out is information on the subject.

You have handed me a prospectus and asked that I tell you what the earnings times interest is. If we don't find a pro forma statement here in the prospectus, I certainly can't make a calculation here on the witness stand. But I would like to read something here from page 6, which is this comment: "Gross income, being the balance applicable to interest and debt retirements before income taxes, etc." Then we have a note: "Excludes estimated Federal and

State normal income tax, Federal Excess Profits Tax, aggregating, $237,000." Then in a note to that, which goes on, it shows that qualification all the way through; it says: "See page 47 for information." You are asking me to do something which requires careful consideration. You stated you asked me to do it only because I said I could take the prospectus and find out earnings times interest. No, I said that is ordinarily given in a prospectus; but I don't see that there is any statement of that here, or a pro forma income statement, such as we prepare in all security issues. If there were, I would be glad to accept the statement here.

1643 You asked if there was any way I could figure out earnings times interest on that First Mortgage Bond issue. Yes, I can do it if you will let me go down to the company's office. I can do it and I can do it easily. I have prepared many such statements.

As to how investors would do it, they ordinarily would take someone's word for it. He would get the information from some stock broker, some investment house. It is compiled in a good many places. It is compiled very frequently in Moody's. I said it would be very important for the investor to know those things before he bought the bond, but I did not show them in this instance because it was not available to us, at the time we made this statement.

If it were a matter of fact that the earnings times interest on that issue of bonds was 4.74, the bond buyer would indeed be interested in knowing that. He would be more interested in knowing that fact than he would be in the fact that the earnings times all fixed charges, including those junior to the issue that he was interested in, were 1.91. He ought to have both figures.

I can add something to that, which would perhaps shed some light on the thing. These bonds are rated Baa, you notice, by Moody's; and they were yielding a 3.55 percent as of September 30 when bonds were selling somewhat off, Baa generally in the electric utilities were selling at 4.39. Those bonds were selling below the Baa public utilities generally.

You asked if that was a direct answer to some question you asked me. That is just bearing on the question you asked.

The funded debt shown here, 56.87, is not the funded debt of particular bonds. Right there I think I better stop a moment and speak about the natural gas industry's reserves. We have reserves, depreciation and depletion reserves in natural gas which are very important which must be considered. It is customary in most instances to publish the debt ratio to total property, and yet that has been seriously questioned in regard to natural gas companies, because depletion is so heavy.

In this particular case the retirement in reserve is $11,000,000 of a gross property base of $57,000,000. Under the $57,000,000 there is a very large item of $13,000,000 of franchises, gas contracts, and intangibles, so when you get back to a debt ratio, a debt ratio standing by itself with nothing else is not as informative as it might be. The other information given here is much more informative than the mere 56.87 or some smaller figure, the ratio of $17,000,000 of bonds to the gross plant, book plant of $57,000,000.

Questions Interposed by the Examiner.

It would reduce this figure considerably, of course, if you take these things off.

Cross-Examination by Mr. Morgan Resumed.

You asked if I set them up that way in my exhibit here. We took Moody's statements. I could be very critical of this company if I wanted to, of some of the items contained in the statement. I could restate it in my own state-
1644 ment by deducting the reserve. I think for natural gas companies you probably ought to do it, but I haven't gone that far as yet.

Questions Interposed by the Examiner.

You asked what the Examiner should do with respect to each one of these companies in that event. I think if you make any conclusions on it you have to consider the reserves, particularly those reserves which are due to the exhaustion of the natural resources. The exhibit gives simply what is contained in Moody's. It does not give those facts. It applies particularly to the bond indebtedness. It is not the intention to submit such information. When I am pressed by the Judge as to ratio I think I may call out the pertinent figures and then you will have them in the record. I have given the figures for the Oklahoma company.

Cross-Examination by Mr. Morgan Resumed.

The bond investor would be interested in knowing the figures for earnings times the interest on the issue of bonds in which he is contemplating making an investment. That information is not in my exhibit. That is not near as important as the yield. The yield is the real important figure on this exhibit.

I have said that in appraising that bond before he bought it at that yield he would be very interested in knowing the earnings times interest and the percentage of total fixed capital represented by the issue of bonds. He can get that indirectly by looking up the classification for the bond. Moody's ratings, for instance, take most of those things into consideration. It takes into consideration this item of intangibles, which I have spoken of. I think the significance of this chart, as I understand it, must be tied up with my statement in direct testimony of the dearth of satisfactory information appertaining to pipeline companies. We have to reason by analogy. I show the rating of Oklahoma Natural Gas as Baa, 3.55. I stated before you can go to Exhibit 185 and see Baa under Oklahoma Natural Gas Company, and find that the yield of Baa bonds is 4.39.

In the case of Panhandle Eastern Pipeline Company, whose bonds are rated at A, you can go to Exhibit No. 185 and you will find that Class A bonds were selling at about 3.41 in August. That was before bonds went up in September, and you will also note that the bonds of Panhandle Eastern are selling above call price.

I think that is the way you have to use these things in arriving at a determination. All the information must be considered. It is not an isolated fact.

No, I don't think the big investors would be more apt to be governed by Moody's rating on the bond than he is by the earnings times interest on the issue and prior issues and the percentage of the total fixed capital represented by the issue and prior issues. The small investors, average size investor would. The large insurance companies have their own investment departments. The other investors rely a great deal upon Moody's ratings. I have no idea whether big investors or small investors bought these bonds here. The Houston bonds and the Oklahoma Natural Gas Company bonds are both Baa. One sold at

a yield of 5.13 and the other at a yield of 3.55. I think the fact that the Oklahoma Natural Gas bonds had earnings times interest in the ratio of 4.74, while Huston
1645 Gulf had only three times coverage, entered into that difference. I do think the percentage of total fixed capital represented by the issue entered into both of those transactions. And I anticipate that the Oklahoma Natural Gas bonds, to continue, will get a rating of A.

Questions Interposed by the Examiner.

The Oklahoma Natural Gas bonds are rated Baa and were selling on September 30 at 3.55.. By referring to Schedule No. 4 of Exhibit 185 you will find that Baa public utility bonds were selling at an average yield of 4.39 in August of this year.

Cross-Examination by Mr. Morgan Resumed.

Passing now to the bonds of Panhandle Eastern Pipe Line Company, First Mortgage, Series A, four and a half, 1952 bonds, that may be a typographical error there. Those might have been 4 per cent bonds instead of four and a half. I would be glad to look that up. They are refunding bonds, I understand. I do not know what the figures are in that instance as to earnings times the interest on the issue of bonds. The same explanation as to why I haven't got it here would be the same as that for the other two issues considered. But that wouldn't affect the yield shown, in my opinion, though. It wouldn't affect the yield on the date on which I show, namely, September 30, 3.63, and when the bonds were selling above call. It would substantially affect the price that the original purchaser paid.

I am not saying that the man who buys the bonds afterwards would not be interested in that at all. My statement, whether it is 3.33 times or 5 times or 10 times, the fact does not change the figures shown in the last column. If the purchaser had bought the bonds at a different price that would have changed the figure in the right hand column. I think you mean that the times interest earnings affects the cost of money to the borrower, and it does. It affects the price that the investor will pay and in that sense affects the yield. It is true

we haven't this information on this exhibit as to that Panhandle Eastern bond; but that is why I am afraid you are indicating that yield would be different. I am clear that if I had the information this yield would not be any different than we show here. It might be true that we would have some explanation of the yield
1646 that we haven't got here. It would help to explain the yield. Also, the correct percentage of the total investment represented by the bond issue would help to explain the yield. In the case of Panhandle Eastern, the ratio of bonds to fixed capital was about 40 per cent, and giving effect to the assumptions that I spoke about when we were talking about the Houston Gulf Gas Company bonds, the earnings times interest on that issue of bonds would be about 4.63. There again I must repeat that the bond is selling at higher than call price. The yield is about the same as public utility classification of A bonds, when you consider selling above par, and that the price was as of September when bonds generally were selling off. That yield does not indicate the cost to Panhandle of the money raised by that bond issue. It is indicative of what the Panhandle Eastern could finance at today by taking into consideration the usual cost over and above the yield to investors. I don't know what the actual cost was to the Panhandle Eastern at the time it issued those bonds. I am familiar with the document you show me, "Security Issues of Electric and Gas Utilities, 1935, 1936, 1937, and 1938, Report of the Securities and Exchange Commission, Washington, D. C." The cost to maturity was 4.46 for the bonds issued in March, 1937. There we are comparing different periods of time. There is two years' difference, and in the meantime the bonds have gone from 4.23 yield to the public down to 3.63 and are selling above call. Those conditions make all the difference in the world. That makes a difference of .23 between the cost to the company and the yield to the investor.

Passing now to the Southern California Gas Company, First Mortgage, four per cent, 1965, $15,000,000 issue, and First Mortgage four and a half per cent, 1961, $12,500,000 issue, we have grouped the two together because they are both secured by the same mortgage. As far as I know, they are both the same indenture and one supplements the other. No, I do not know what the earnings times the interest was in the case of these two issues.

I know the earnings times fixed charges was 5.29, which, of course, is a very nice ratio. I don't think it would make much difference if the ratio were higher than that, because there is a limitation upon the earnings ratio after it gets beyond four and one half or even four per cent; the effect of the increase diminishes greatly. I have no reason to question your statement that the times interest coverage in that case was 6.43. It appears to be true that the total per cent of fixed capital represented by the two issues of the bonds was about 20.83. It turns out that these two bond issues are all of the funded indebtedness of that company and the following company. Those two companies are very large distribution systems. They are more than that. They have distribution and they are large companies, the Southern California Gas Company being very large. The latter company transports and distributes natural gas to and in Los Angeles, San Bernardino, Ventura, Kern, and Fresno Counties in California. That is a great metropolitan area in southern California. It gets its gas from some fields down there in Kettleman Hills and around in that section, not a great distance from Los Angeles. Yes, it produces gas in Buena Vista Hills field, Kerns County, California. It purchases gas from a good many companies. The company transported 21,000,000 M.C.F. in round figures of gas for 29 companies in various parts of its system. It has 770 miles of twenty-six to four inch transmission lines, according to statements filed with the Federal Power Commission. A very, very large per cent of its revenue is received from retail distribution. It is transporting this gas for 29 other companies for hire. It is not unusual at all in the gas business. It purchases gas and transports it along with its own gas to its own retail market, but it transports it for others, according to the statements to the Federal Power Commission. The company produces and purchases
1647 about 93,000,000 M.C.F. and 21,000,000 M.C.F. of
that it transports for hire. It makes whatever disposition of this 21,000,000 M.C.F. it transports for these other 29 companies that they want made of it. It delivers it for them. I don't know whether there are 29 distributing companies within the areas served by that company's pipeline. It is a distribution company. I know the company reports to the Federal Power Commission on the Commission's Order 51 that it transports a total of 21,-

000,000 M.C.F. for 29 companies at various points within the state of California. That is as much detail as I can give. I have said that was not unusual practice among natural gas companies. I have in the file of the Commission many reports showing that they transported gas for others. I can't name the other companies offhand. That is one of the questions which we ask in our questionnaires and get a lot of affirmative responses. I am unable to say whether any other gas pipeline ever transported gas out of Texas for hire.

The next bond is Southern Counties Gas Company of California, First Mortgage four and one-half, 1968, $11,500,000, Aa rating. The times fixed charges earned in 1938 appears to be 3.58. It may be, as you say, the times interest involved in that particular issue of bonds, is about 3.89. I have given, as I said before, times fixed charges earned. 37.24 is the total per cent of the fixed capital represented by the issue of bonds. That company also is engaged almost exclusively, so far as its revenue is concerned, in the business of selling gas at retail.

That leaves one other company, Southern Natural Gas Company. It has two bonds, First Mortgage four and one-half, 1951, $12,939,000, rated Baa, and an Adjustment Mortgage six per cent, 1960 maturity, rated B. I think the first mortgage series are superior. The company got into difficulties and was reorganized and the adjustment mortgage bonds came out of the reorganization. Under the column "Times Fixed Charges Earned" they are grouped together in the exhibit. I do not know what the earnings times interest on the first mortgage series of bonds was. I haven't the information on that just as was true in the case of the others. The gross fixed capital in round figures, $30,000,000, and the amount of the bonds is $12,000,000. That would make about 40 per cent of the total fixed capital represented by the bonds. Yes, you would have to add to that issue of bonds $616,000 not placed with the public in order to get the real coverage, which would be about 40.5 per cent of the total fixed capital. Of course, that company went through reorganization a few years ago and again its bonds are showing a yield of 3.90 although they are rated Baa. The public utility Baa went to 4.39 in August. I haven't the data to show what the percentage of coverage is. The fact that it is engaged in an intensive load building campaign and has prospects of additional developments doesn't give its bonds a speculative value as well. It might give the securities as a whole some speculative value. The company has been in difficulty, undoubtedly. There are better hopes for it after the reorganization, but it has a line going from the Monroe and Richland field in Louisiana over to Atlanta, Georgia, and another line in Georgia going off the main line to Selma and to Columbus, all pretty long transmission lines. I think a yield of 3.90 for that particular company is certainly a good yield.

You ask if, in the light of the circumstance that those Southern California Gas Company and Southern Counties Gas Company of California bonds are based on an income derived almost 100 per cent from the sale of gas at retail as opposed to the selling of gas at wholesale on a gate
rate, we couldn't get closer to the natural gas pipe-
1648 line situation if those companies were eliminated
from the exhibit. I think you could find other companies somewhat closer. As you have stated, these companies have large retail distribution. It must not be forgotten, however, with their large investment in transmission properties, if anything happens to producing and transmission companies, they would be in a serious condition because of the large investment in such properties. It affects the over-all rating. This is not a pure producing and pipeline company such as the companies we have here under consideration. I think it is true that they have a very large proportion of their total investment in facilities which are convertible to manufactured gas facilities. If those two companies be eliminated it changes the average. I really think a comparison ought not to be so much with the average as with the individual companies. Averages are so frequently misleading. For instance, there is a serious question in my mind as to whether any such bonds as the Adjustment Mortgage bonds of Southern Natural Gas Company should be included in any average showing the yield on bonds of natural gas companies because of the circumstances surrounding their issue. You have questions in all these companies which make it necessary to weigh each individual company.

I refer again to the Oklahoma Natural Gas Company. The Oklahoma Natural Gas Company I believe was in a holding company system up until 1936. It had a little disturbance there when the stock was distributed to individual stockholders. I want to give the Examiner the information that if you take just one average and use that exclusively you are not likely to get the right answer in determining a proper rate of return; a great deal of judgment has to be applied. The real evidence of the investor's appraisal is, of course, in the last column, the yields. What information the investor had which enabled him to make the investments, of course, that is a different question. He undoubtedly would have Moody's rating and would rely considerably on those unless he had the services of an investment counselor or an investment department such as you have in insurance companies. As to the appraisal by the investor of the yield that he ought to have on his money and the security he should have on his money in the form of earnings times interest, you asked if I wouldn't be more apt to get at the actual thinking of the investor along those lines if I had used 1939 earnings instead of 1938 earnings. You mix a couple of things. I want to go along with you but some of the language you use would put me on the spot if I gave you a direct answer. Certainly, the investor's appraisal as to security of interest and security of principal relates directly to the times interest earned and to the relationship of his security, the security outstanding, of which he owns a part or all, to the plant and to other capital of the company. Yes, he buys it on the information as of the latest time he can get the information, and he will frequently attempt to make a forecast. That forecast is not speculation; it is based upon economic studies. You ask if he had available to him published figures as to the earnings in 1939 whether such would be of more help and would be apt to lead to the more correct result, in weighing this element in considering a proper cost of capital. I repeat, the most recently available information is the best information on which to base your judgment. The disturbance to which I referred a moment ago in connection with my discussion of the Oklahoma Company occurred when the holding company distributed the stock to the stockholders. All those things help disturb the securities temporarily until they become stabilized. Any major transaction affecting securities will have some effect upon them. The fact that these securities were selling on the market at a yield of 3.55, selling above call, shows that the investors consider these securities as good.

1649 Schedule 5-D has to do with preferred stocks rather than bonds. This page of the exhibit shows the Total Outstanding Poor's Rating, Times Dividend Requirements

Earned 1938, Times Fixed Charges and Dividends Earned 1938. The difference between the times dividend requirements earned and the times fixed charges and dividends earned is due to the circumstance that the great bulk of fixed charges, like bond interest, and so on, is ahead of the preferred stock. The column Schedule 5-D headed "Times Fixed Charges and Dividends Earned" includes the interest charges not only on first mortgage bonds but on debentures, notes, and all other interest charges that come ahead of the dividends and the preferred stock requirements. I should say that all these interest charges are senior to the preferred stock charges. That is the normal situation. In this instance, as in the case of the bonds, we use the earnings for 1938 rather than the earnings for 1939 as a basis of comparison. I don't know which of these issues of preferred stock were new capital issues as opposed to reorganization or refunding issues. I haven't that information. I should think it would be available for the recent issues. Whether available for some of the older issues or not, I don't know. My exhibit doesn't show just when the issues were put on the market. Ordinarily, Moody's Manual shows when the securities were issued. I didn't think it was necessary to have that information worked up because the current yield is the important thing in this chart regardless of when the securities were issued.

Schedule 5-F has to do with transactions in the common stocks of some of these gas companies. From that I have eliminated two companies which I have said ought not to be in this exhibit, namely, Indian Territory Illuminating Oil Company and South Penn Oil Company. It appears that on the common stock of El Paso Natural Gas Company the earnings per share were $3.30 for the year 1938. I do not know what the earnings per share for the year ending July 31, 1939 happen to be. I haven't anything with which I could check your figures on that. The term that corresponds in common stock transactions to yields on bonds is price earnings ratio, plus one other thing, the dividend payment. The price earnings ratio is not conclusive because the dividend payment of the corporation has an effect upon the market value of the security. A good many investors buy for a short term. If the earnings are large for a short term and dividends are not paid out they do not benefit from the increased earnings in the way of dividends; so the dividend policy must also be considered. If the earnings per share for the latest twelve months published prior to this transaction here, namely 12 months ending July 31, 1939, had been 3.77 instead of 3.30, the price earnings ratio would have been changed. It would be higher. There again you must not overlook the fact that the equity stock of El Paso Natural Gas Company selling at 40⅝ is greatly in excess of the book amount of 12.36 for common stock for natural gas companies. That isn't a particularly favorable situation. It has a great deal to do with the market value of the stock, tending to keep it down. We included the Houston Gulf Gas Company because we show in Schedule 5 that certain of the common stock of that company was owned by the public and Schedule 5-F ties in with Schedule 5. Its stock did not have any market value in 1938 of which we could find any record.

Going on to the Interstate Natural Gas Company, total shares 952,953, I do not know what earnings per share for the year ending July 31, 1939, happen to be. In order to arrive at the investor's reasons for paying the amount he did for that stock it would be nice to know that; it would be
worth having. As a matter of fact, it would be worth
1650 having up to the very date of this quotation, although
there is a great deal of diversity of opinion as to just what average you should take into consideration in computing earnings and also in computing prices in establishing your per cent of earnings to quotations. The investor would try to get up to date information, the very latest data available. This particular per share earning in the case of the Interstate Natural Gas Company was 2.13.

Now, in the case of the Manufacturers Light and Heat Company we did not have any available data as to the quotations. The 3.96 we use here was earnings per share. That is all right. Without the quotations you cannot compute it. I believe we used the 1938 earnings per share figures in the case of Oklahoma Natural and in every instance. I believe it is true that we used transactions in the months of September and October, 1939, in arriving at our price earnings ratio. We related the price in September and October, 1939, to the earnings in 1938. The average, 7.33, was a weighted average based upon the amount of stocks outstanding as reflected by the books. The weighting was in proportion to the total amount shown as outstanding in the second column of figures. Having used an amount paid for the stock in a market transaction as a basis of arriving at the price earnings ratio, it certainly would have been one acceptable method, and perhaps a better method than was used here, had we arrived at the market value of all the outstanding stock by using the market price in order to get the weighted average of these price earnings ratios. I don't know what the result would be. I repeat, I don't think that you can use averages with such a small sample to any advantage in a case of this kind. You have to study the individual companies.

You ask why I put the averages in here. It was put in by one of my men who prepared this schedule. If I had been preparing it originally I think I would have left it out. I think it is far more important in this schedule to consider the rating of these securities, all of them rated rather low, with no A securities, no B, Baa, Aa or Aaa.

If in using the earnings for 1939 instead of the earnings for 1938, in arriving at the price-earnings ratios, based on prices in September, 1939, and in using the market value of the stock instead of the book or stated value of the stock to obtain the weighted average, the result turned out to be 10.31 instead of 7.33, it makes a considerable difference in the average presented in this exhibit, and it would make a difference in the price earnings ratio. As I told you before, we cannot get away from the statement that I made in my direct testimony. There is a scarcity of reliable information. The cream of the stocks of the pipeline companies is not shown in the schedule. It is a pretty poor schedule, as a matter of fact, to use for rate of return, but it is the best we could get. The difficulty is that the stocks are held by holding companies. I wouldn't say that they are not offering them for sale to the public because the public is afraid of them. I don't know. Public financing is resorted to in the matter of equity capital in the electric business but not in the gas industry at the present time. It and the gas industry both are in the same category at the present time. There is very little equity money being issued here. I think one of the reasons why holding companies are holding on to the securities is that a good many of them are paying handsome dividends; they are good investments. If you go back to the 20's, I don't think the pipeline companies were in demand or the securities of the pipeline companies were in demand, but nevertheless we have a different picture today. We see one thing which is somewhat unusual.

1651 We see a lot of bank loans, running for several years, to natural gas companies. Ordinarily you do not find it to that extent in the case of electric utilities. Banks apparently think they are safe loans. The Northern Natural recently procured a six million dollar bank loan. It is a rather outstanding feature of the natural gas industry, which is one of the unusual financial features, as a matter of fact, in the industry. I don't think you can go back to the time of 1926, when you indicated pipelines were rather in their infancy, and make comparisons with the present time. In my direct testimony I mentioned the fact that if you excluded the South Penn Oil Company the figures of 7.33 became 9.14. I said several times recently this afternoon that I don't think any average should be used in any event. I have also said that the best common stocks of the industry were not represented herein Schedule 5-F.

Schedule 6 has to do with bonds that have been issued since January 1, 1935, through September 30, 1939. It deals with yield to the public and the net cost to the company as of the time the original issues were sold. The yield to the public is absolutely the best market appraisal that you can get at the time sold. This exhibit shows the yield to the public at the time of issue, and that as of the latest date available. At the time I prepared this exhibit I did not have all of the proforma earnings that were used in the prospectus prepared in connection with the issues because a great many of these issues were sold privately. As to some of the others, undoubtedly we did have information from the Securities and Exchange Commission. It is a matter of concern and importance, of course, to the investor who purchased these issues to have the information of proforma coverage, that is, earnings times interest, and coverage on all fixed charges. You ask if it would be helpful if it were added to this exhibit. It would be additional information, but this exhibit was put in for the purpose of showing some trend back to 1935, showing the facts as to financing and as to yields. It did not occur to me that anyone would want the interest coverage at the time of issue back in 1935, 1936 and so forth. I don't think that would be helpful even in examining the trend or as explaining some of the factors that enter into the trend. Come to think of it I don't think it would be of any benefit whatsoever. I think it would be just surplusage. Yes, I think the price that was paid by the investor at the time he bought the security was influenced by that. I know it was, but at the time of the sale of these securities the coverage in 1935 is not so important as what the yield was on those securities back in that time. That is the important thing. I tried to show in the other schedule information as to coverage. You ask that if it be assumed that in 1935 a security was sold on a yield of 4 per cent, that the coverage shown by the information contained in the prospectus of earnings was three times the interest on the issue, and if in 1939 it develops that the yield was 3.8 but at that time the proforma coverage was 7, whether you would have to take into account the difference in the coverage in appraising the trend. My answer is no. That is, Schedule 6 shows the yields by ratings. Schedule 5-A shows the yields by ratings also. The biggest factor between 1935 and 1939 is the money market, the change in economic conditions, which are reflected in the yields themselves. That is what I think is the big factor. Certain coverage had something to do with it. It is not as influential in the trend as the other factors which I mentioned. The rating is the important thing in making comparisons. For instance, going back to Exhibit 185, we show Moody's Bond Yield Statistics. Bonds are classified according to ratings. Those statistics are used tremendously, and yet we don't have any information as to coverage. We find information as to ratings. That is about the only way we can tract these things through a period of years.

1652 I don't know when Moody's rated the bonds of Southern California Gas Company. It is not likely that they rate them before they are issued. In fact Moody does not rate them before they are issued. While an investor did not have the benefit of Moody's ratings at the time he bought these securities, he may have had a pretty good knowledge and information about it. Our office can tell pretty well what a rating will be before the security is even issued. You ask if the investor would concern himself with how Moody was going to rate the bonds rather than about the coverage. You bet your life he would, because that affects the price considerably. If he thought these bonds were going to be rated Aa by Moody, he would not begin to pay as much as if he thought they were going to be rated Aaa.

Here is a bond sold in July 1936 with a yield of 4.18 and another bond with the same rating sold about 8 months later with a yield of 4.23. You ask what kind of a trend that indicates. It shows a big difference in the time. 1936 was a very fine bond market. The bond market went off in 1937. Of course, the coverage had a great deal to do with the rating; and the coverage is always influential. I am speaking of the purpose of this exhibit. One of the significant purposes of this exhibit is that it shows the yield at the time of issue. By going to Schedule 5-A you can see the yield today. We find a lot of securities shown on this page were refunded, during the period covered by the schedule, at reduced prices, and in some cases at a greatly reduced yield. The coverage enters substantially into the rating because the rating considers, among other things, the security of the principal, the security of the interest; and coverage is one of the best indications of security of principal and interest.

That is the reason that that factor is considered by Moody and those who rate bonds as one of the important things which investors want to know about. I have said many times in my testimony this afternoon that coverage is a very important factor, particularly up to a certain percentage, up to about four times. Beyond that the effect of it diminishes very rapidly, and in some cases it is almost imperceptible. I don't think it is important as far as this case is concerned. You ask whether I think it would be helpful in determining the trend of bond yields over the four years covered by this schedule, either upward or downward or otherwise, if we had the proforma coverage, which I have said investors probably considered at the time they bought those bonds. As I understand your question, I don't think the coverage at the time these issues were made would add anything to the case. Yes, the proforma coverage had something to do with the price that was paid.

We show here the net cost to company; and in the case of the Southern California Gas Company there is a difference of .2 per cent in yield to the investor and cost to the company. In the case of the Arkansas-Louisiana Company there is a difference between yield of 4.18 and a cost of 4.62, or a difference of .44 per cent. In the case of the Panhandle Eastern bonds the yield was 4.23 and the cost 4.46, a difference of .23. In the case of Oklahoma Natural the difference was .35. I don't have the cost figures of the next Oklahoma Natural issue. We could not get them. We looked for them, but we could not get the cost to the company. In the case of the Southern Natural, the yield is 4.50, the cost 4.85, a difference of .35, and in the case of El Paso Natural the difference is .42. In the case of
1653 Northern Oklahoma Gas Company the difference is
.85. I don't think this cost to company, as that term is used here, reflects all of the cost of that money to the company, as a matter of fact. We followed here the usual method of giving the maturity. The sinking fund provi-

sions sometimes change the result. The issues in the great majority of cases during that four-year period have been refunding transactions. There is often a premium to be paid to the holder of the retired bond in order to get that bond, but that does not affect the cost of this new money. That is the cost of the old money. That should not be considered in the cost of the present money. If he is to get the benefit of the reduced rate of interest he has to pay the premium to do so. He pays it because he wants to terminate the old contract, just because he has old bonds outstanding and wants to issue new bonds and bring the old ones in. It is not a part of the cost of the new money, it is a part of the cost of the old that he has to pay for terminating that contract. He has to pay that cost where he wants to terminate the old contract and get the new money, whereas, if he did not have anything like that, the new money would not cost any more.

There is duplicate interest for a period of time, that is, from the time the new issue commences to bear interest until the old issue can be retired. I would not consider that a cost of new money either, because that does not affect what the investor would pay for the new bond. The fact that the company has to pay duplicate interest does not at all affect the investor's attitude toward the new bonds. That is what the company has to pay to get rid of the old contract. You ask if that is not actually a cost to the company. I look upon that more in the sense of a penalty that the company pays to terminate the old contract. I will agree with you that the set of figures on net cost to the company shown here does not include all of the cost. I will say that with good bonds issued today that the added cost of floating securities is less than it was back in 1936. I think this is due chiefly to the activity of the Securities and Exchange Commission. I think that four-tenths of one per cent would cover both the cost of printing and legal fees, and all those expenses, as well as the differential due to some of the sinking fund provisions. I would say that four-tenths of one per cent would be ample.

Now, in the case of the securities of the Northern Natural Gas Company, that bond sold, with practically no sinking fund provisions, at 3.25 yield, which is not very far from the cost. The cost would be slightly above that, but not very much. In that case four-tenths of one per cent would be exorbitant, but speaking generally of the sale of securities in the market with those usual sinking fund provisions, requiring early maturities, I would say that four-tenths of one per cent would certainly be adequate. I think the case of Oklahoma Gas, which it appears ran to .85 above the yield, was some time ago, in 1936. It would make a difference. The cost is less today than it was a few years ago. You know, the Securities and Exchange Commission and the Federal Power Commission, and other Federal agencies which have supervision of these matters, have been scrutinizing most carefully the cost of floating securities, scrutinizing the fees which have to be paid, so the cost has trended downward during the last few years. You ask whether these hearings over in Washington, the preparation of testimony and going over there to have it presented at hearings, runs the cost down. Considering all of those things, two-tenths of one per cent is what you might say is the cost of floating good bonds today, and that is floating them by underwriting, and so forth. Of course, in some instances, such as up in Massachusetts, where securities are sold by public bid, pursuant to orders of the Commission, there frequently the costs are cut down even below one-tenth of one per cent.

1654 Passing on to Schedule 7, we have some preferred stock transactions during the same period of four years which are set forth here. There are two transactions; I am sure the second is a refunding transaction. I am not sure about the first one. One was issued in 1936 and one in 1939. The 1936 issue was called for redemption on October 7, 1939. The funds for the purpose were obtained from the sale of $5.50 prior stock, according to the note on the schedule. You ask what I gather from the circumstance that in four years, January 1, 1935 to Sept. 30, 1939, only one gas company brought out an issue of preferred stock, and that at least one of the two issues, if not both of them, were refunding transactions. I know that there is not a great deal of preferred stock outstanding in the hands of the public in the first case. As a matter of fact, that is about my only knowledge of the subject. I would not say that preferred stock really has no place in the financing of natural gas pipeline companies considering the way investors regard the amortization feature in connection with bonds. It is true some authorities claim preferred stocks have no place in any picture of financing. I would not go that far. There are some who argue that certain sections of the Securities and Exchange Holding Company Act prohibit preferred stocks, because, they claim, the company shall have but one class of stock. There are many arguments about that question. I am still pursuing the middle of the road on that proposition. I think it has a place and can be used. Even if those in the business do not use it, they can use it to a reasonable extent, and it is being used somewhat. I don't say that they should use it. I say it would be perfectly logical if the companies involved in this proceeding should issue a reasonable amount of preferred stock at a reasonable cost. It would not be safe to assume that defendants' or any other pipeline company would do it in the light of what they have been doing during the years, because of the inter-company ownership of securities.

We haven't any common stock transactions, new issues of common stock, during that four-year period. You ask whether I would assume that common stock could be issued and sold on the market at a price earnings ratio proforma bearing the same relation to the cost of raising such capital that I have said the cost of capital raised through bonds has to the yield to the investors on bonds, namely, four-tenths of one per cent. I would say the cost of floating equity securities would considerably exceed the cost of floating mortgage bonds. You ask what would be the relation in the case of a company who has securities on the market, such as those shown in Schedule 5-F, between the price earnings ratio and the cost of money obtained through the flotation of equity issues. You are now getting to the point where we have to consider each individual company. You can't deal with generalities because the cost fluctuates considerably among various companies. Just considering it on the position of companies we have here, or that we find throughout the industry here, which I term an artificial condition, I repeat again that we do not have the abundance of information on natural gas companies that we have on other utility enterprises. I would like to answer your question, but I have to have a pretty good basis of assumption on which to give an intelligent answer.

You ask what per cent of the total capitalization of the natural gas pipeline industry as indicated by these 29 companies that we have left in from Schedule 5, is represented by first mortgage bonds. Schedule 5 shows on page 6 that the total bonds, debentures, and notes of the companies we have under consideration, outstanding, are 1655 $418,882,597 out of a total capital structure of $1,038,250,901, or roughly, 40 per cent. Now, when we come to individual cases you will find a tremendous variation. The variation is enormous. I have studied the patterns a great deal. Just to pick one at random, the El Paso Natural Gas Company; total bonds and notes, $9,000,000 out of a total capital structure of $12,000,000. That company's securities are held by the public and by institutions. It is a good one to take. Three-quarters of the capital structure are in bonds and notes. That appears at the bottom of page 1 of Schedule 5. Yes, there is a premium of $3,486,000 shown there. If you add that it becomes around $16,000,000. Still, there is more than 50 per cent outstanding in debt securities. The Cities Service Company shows $43,000,000 of debt securities out of a total of $73,000,000. Let us take any one you want. My point is that they vary all over the lot; you can't say that there is a representative average. The average is about 40 per cent. I am willing to make an assumption of 40 per cent of debt securities. I think that is reasonable. That 40 per cent includes bonds, debentures, notes, and so on. The bond yields I have presented as a guide and to which I have referred had to do with first mortgage bonds, generally. You ask if they do not constitute more than 20 per cent of the capitalization. They do in the case of the Cities Service. So many of these securities are held by affiliates I don't think I can answer it by companies. I would rather give my opinion evidence that I think a good sound pipeline company could issue bonds up to the extent of 40 per cent. I would like to emphasize in that connection one point which I haven't mentioned yet, but which I think is very important in connection with the soundness of securities, and that is that adequate depreciation and depletion expense must be allowed and taken by the companies in its expenses, because that goes to the safety of the investment.

You ask what percentage of first mortgage bonds do I find in these figures which I have presented in evidence. My statement is that it varies considerably. You take the Arkansas-Louisiana Gas Company and also the Canadian River Gas Company and you will find right there there is great variation. I do not show the yield on Canadian River Bonds. The stockholders own those bonds. I have no doubt but that a sound pipeline company could issue 40 per cent bonds, and would have over four times the interest

coverage, and I think that is an important thing. I think that a good pipeline company could issue bonds at the very maximum of 3.75 per cent cost—a good pipeline such as we have under consideration here. I mean 3.75 per cent cost to the company. From Exhibits 186 and 185 it can easily be shown that that would give a yield of 3.5 per cent, which I think is high. I have no doubt in the world that it could be done, and that would give interest coverage of 4.68 times, which certainly would be adequate. You ask what is the earning that I am using in order to get at that ratio of 4.68. The earnings would have to be somewhere between 6.2 and 6.5 per cent. I am not necessarily assuming a rate of return of 6.2 to 6.5 in order to get that coverage, but I say the company could easily finance under that price, possibly considerably less, but not any more. You are correct in that the earnings are to be fixed by the Federal Power Commission, assuming that it has jurisdiction to fix the rate of return. Certainly a prospective investor would take due notice of the pending proceedings. There is no question about that at all. You can reason by analogy, when you come to the interest coverage, if the earnings are sufficient to earn the interest coverage four times, I think, you could easily issue bonds up to 40 per cent. You ask on what basis I think this 6.2 per cent would have
1656 to be applied in order to get four times coverage. I
would say that your bonds would be 3.75 on 40 per cent bonds. Your preferred stock, 20 per cent, yield to the public of 5.75 plus .35 for cost of issuing, which is undoubtedly high, but it is certainly a fair figure, and the price earnings ratio of 8 per cent on common stock plus a ten per cent cost of floating the stock, which is certainly ample. Now, I have been very liberal in those figures. I have given the outside figures.

(EXHIBITS 189 and 190 were offered and received in evidence without objection.)

1657 E. D. OSTRANDER, a witness for complainant called for further examination, testified:

(December 1, 1939.)

Direct Examination Continued by Mr. Booth.

There are a few things I think perhaps should be cleared up at this time. At page 7784 Mr. Slaff asked whether Standard Statistics Company published the list of fifteen bonds used in the average of yields on municipal bonds. I find that at page B-114 of Volume 3, Statistical Section, of Standard Trade and Securities Service, a list of bonds formerly used in the index is presented. That page to which I made reference is in a publication or a section of Standard Trade and Securities Service dated in 1936. In 1937 the average of yields on municipal bonds was revised on the basis of a new list and it was worked back to 1934 on the basis of a new list. I wrote Standard Statistics Company and they have sent me the present list. If you want a copy of that in the record I can hand it to the reporter and have it copied in if you want it.

I might add I believe there was some question as to whether that was a weighted or simple arithmetic average. I am informed it is a simple average.

At page 7785 the Examiner asked me how the yields on government bonds as shown at page 5 of Exhibit No. 180 were prepared. At that time I believe I said it was based upon bonds not due or callable within eight years. I find in a recent revision that was given in the December, 1938, Monthly Bulletin of the Board of Governors of the Federal Reserve System that they are now using U. S. Treasury bonds not due or callable within twelve years and that is true back to 1926, but prior to 1926 it is still the eight-year basis.

I talked to one of the men in the research department of the Chicago Federal Reserve, and he informs me that this yield of U. S. Treasury bonds is a weighted yield. That is all the information I have on that point. I have nothing further on that particular point. With respect to the figures which I show on page 5 of Exhibit 180 I observe that the 1932 figure for yields on U. S. government bonds should be 3.68 instead of 3.66, as shown there.

If I recall correctly I was also asked something about how the bond yields shown on page 8 of Exhibit No. 180 were prepared. I made some discussion of that at the time. That refers to Standard Statistics Company's bond yields by class of rating and by industrial groupings. My information from Standard Statistics Company is that it is a simple unweighted average, not weighted. There are some other comments there. I don't know whether you want to have those in the record or not. You can put the letter in too. It is quite agreeable with me. I would like to indicate I wrote two letters to Standard Statistics Company, one about the municipal bonds and one about the corporate bonds. In this letter, which I understand is to be copied into the transcript, the first two paragraphs of the letter refer to the municipal bond yield information and the third paragraph refers to the corporate bond yield shown on page 8 of Exhibit 180; just so there will be no misunderstanding.

1658 "Standard Statistics Company, Inc.
345 Hudson Street, New York.

"November 17, 1939.

"Mr. E. D. Ostrander, Supervisor,
Rates and Research Section,
Illinois Commerce Commission,
160 North LaSalle Street,
Chicago, Ill.

Dear Sir:

"Enclosed is the list of municipal bonds used in our index. This list was revised in 1937 and extended back to 1934. The record of this revision may be found on pages B172, B179, B184 of the Volume 3, Statistical Section of Trade and Securities.

"The yield is a simple, unweighted, arithmetic average. Since January, 1929, the monthly average is obtained from the four or five weekly observations by using the simple arithmetic average.

"Our index of bond yields by class of rating is based upon the yield to maturity of a representative list of bonds in each group. Bonds having any extraordinary yield, thus called bonds, short term maturities, bonds, selling above call prices, are excluded. A simple unweighted average is obtained from the resulting representative list.

"Trusting the enclosed information will prove useful to you, we remain

"Yours very truly,
Richard Doyle,
Economics Division."

San Francisco	4½s	1960"

1659 Now, at page 7827 I indicated that the rate of turnover of bank deposits should also be considered as well as the mere volume of bank deposits, but on checking over the transcript I feel perhaps I did not tie the two things together very well.

To state it very briefly, the slower the rate of turnover of deposits the greater the idleness of the funds, or the greater the amount of funds the bank might have available for reinvestment. That is particularly true, as any given bank, any individual bank whose deposits are turning over very rapidly would probably keep itself in better position than the bank whose deposits were turning over very slowly.

There is one other thing, at page 7836, beginning at line 12, I said:

"When the member banks acquire U. S. securities, no immediate expansion in deposits and reserves results unless the member banks borrow in order to buy securities."

That statement is not correct. I don't know how that got in there. I have no doubt I said it but I want to make some correction in it.

When member banks buy U. S. government bonds it doesn't increase the reserves. It may affect the division of total reserves as between required and excess reserves, but the total reserves are not affected. When banks buy U. S. government bonds it does affect the volume of deposits, contrary to what I said earlier here. When the banks use their own funds to buy government bonds it is the same thing as extending deposit credit to the government, if they are buying new issues, the government in turn will spend that money and it becomes deposits somewhere else in the banking system, so ultimately it does become deposits, an increase in deposits. I wanted to make that clear. Of course, that same inaccuracy is indicated along about lines 19 and 20 on page 7836.

There was one other matter. At the time the direct testimony was given Mr. Morgan asked me some questions about this money market testimony. After thinking it over I got the impression he was asking me if this represented a rehash from something else. I answered at the time that I believed everything I had put in and said it could probably be found in the reports of the Board of Governors of the Federal Reserve System. I am referring to my statement shown in the record at about page 7838 at which time Mr. Morgan asked me if the affirmative statements that I had been making about Exhibit 183 were contained in the sources and merely abstracted or paraphrased by me, or whether they were my own interpretation of what the figures taken from the authorities show, to which I answered "I would say partly both." To avoid any indication I was not being completely frank I want to say testimony very similar to this and an exhibit almost identical to this were put in the Peoples Gas Light and Coke Company case before the Illinois Commerce Commission by another person who at that time was a member of my staff, he, another member of my staff and myself working up the material. For the purposes of the present case I largely brought the statistical material down to date, although I did attempt to shorten it in some cases a little bit.

I believe that is all I have at this time except I handed to Mr. Booth a copy of the corrections of a more routine nature.

I left residence at the University about November, 1929. I had not finished my degree at that time; that is, I was lacking a thesis. I continued on that and finished it up in 1931 and received a degree in 1931. I went directly from the university as a student to the Investment Research Corporation of America at Detroit. You ask what was the scope of my duties while I was with Dr. Edie over there at the Investment Research Corporation of America. I can best explain that by indicating briefly the nature of the organization. We had a group of men there that were called industry men. It was their duty to study industries generally. We had a group of men we called company men and they devoted their time primarily to specific companies within an industry and then, of course, we had the economics division, with which I was associated.

Our duties in the economic division were to collect and prepare the information on economic conditions, prepare forecasts of economic conditions in general, and in more specific lines where possible, for use by these other men. That is, they would predicate their opinion somewhat upon our opinion as to the general outlook. Obviously you can see that the two are related.

Now, getting down into more detailed work, I do not recall very specifically all the things I did, of course, but I can enumerate some of them. I did quite a bit of work with industry profits and with the studying of price earnings ratio. In fact, we constructed an index of industry price earnings ratios extending back to 1900. I also worked with other economic series in attempting to analyze them and project them by statistical means, such as the curves of automobile production and registration, and we also kept some figures in series on the condition of the Federal Reserve System, including both the Federal Reserve Banks themselves and the member banks.

We had two men, I believe, who were devoting their attention primarily to public utilities. I worked with them as well as the other men in the organization in discussing various aspects of our research. My work was of a statistical research character, I would say.

When I went with Mr. McKinsey my work was primarily public accounting. I am not a certified public accountant. I have never engaged in the private practice of accounting. I have kept books, but I have not been an accountant in the sense you have indicated. When I was with Emery, Peck & Rockwood, of Chicago, my work was more in the nature of investment work. I mean I had more call upon accounting knowledge there than statistical knowledge. We dealt with financial statements more than economic statistics.

Of the ten years since I left the University I have spent six of those years with the Illinois Commerce Commission. You ask what kind of position I first had with the Illinois Commerce Commission. I went in there as a member of the staff of Dr. Raver, Dr. Paul J. Raver, who was head of the research division there. I think I might have been referred to or was referred to as a financial analyst, a title that I hold no particular brief for. Thereafter, beginning, I believe, about the first of July, 1935, I was designated as assistant supervisor of the section, and those changes in title relate partly to budget problems over there. I mean, when the new group was organized there was no direct provision in the budget for such a section and such a title, you see, and it was not until 1935 that that was organized along those lines. And then on March 1, 1937, I was made supervisor of the section at the time that Dr. Raver was made executive officer of the Commission. 1661

My title is now Supervisor of the Section of Rates and Research. I work with Mr. Kleinman many times, but not under his direction particularly. I am not a member of his staff. He is in the Division of Accounts and Finance, I believe he calls it.

I have devoted a great deal of my time to statistical research in various fields. I have studied the statistics of the revenues of the Illinois public utilities. I have made rate analyses and comparisons and studies in relation to accounting and statistical procedure, and reports of utilities. I believe the monthly reports of the utilities to the Illinois Commerce Commission come to my division. The annual reports come to Mr. Kleinman's division, but we make a great deal of use of them. Generally speaking, I am familiar with the nature and scope of those reports. I often have occasion to refer to them and to use them in my statistical studies, particularly those of the electric and gas companies. When I say rate analyses, I am referring primarily to analysis of the effect of proposed changes or revisions in rates in terms of revenue to the company, or looking at it from the other end, in terms of bills to consumers. Part of it means the taking of a rate schedule and stating it in terms of dollars. We sometimes apply that, of course, to what we call consumer analyses to measure the effect in revenue. By rate comparisons I mean simply a comparison of charges under one rate as against charges under another. Oh, yes, I think that has something to do with comparing the rates of one concern with the rates of another concern. We resort to that sort of thing in connection with our work on rate comparisons. We do that just to get the level of rates in different localities. I think that is important as a part of rate making studies, to know what rates are being charged by others.

I have never compared the city gate rates of the natural gas pipeline companies that deliver gas or sell gas in the State of Illinois with the rates of other pipelines. I have not gone so far as to compare the rates of these pipelines which sell gas at the city gate in the State of Illinois with the rates of other pipelines which receive gas from the same source, namely, the Panhandle field in Texas. My reason for not doing that is not that I do not think it is important. I think it would be interesting and worth while information to have. I just simply have never done it. You ask whether I think that would be worth while information to have in connection with a rate study of any particular pipeline such as defendants. I don't think it would be of great value. I mean the rates of this company are a problem somewhat separate from the rates of other companies. The only purpose or use that might be made of such information is just a broad background or basis of forming judgments. I said such a comparison was important from the point of view of knowing what the level of rates is in different communities. It is a matter of information. I do not think it is as important from the view of public information, of course. It is important for the Illinois Commerce Commission in the sense that they might look at one and if there was a vast difference inquire as to what reasons there might be in justification for that.
1662 I mean, you can only use those comparisons as the broadest sort of starting point. Whether or not I think it important or proper is not the reason why I did not do it or would do it. I mean I just did not do it, that is all. I never gave it much thought as far as that goes.

The amount of work I can do is distinctly limited, and this case has already taken up too much of my time as it is.

For my own information I would like to know whether Chicago is buying gas cheaper or higher than any other city to which gas from the Panhandle field is being sold. I do not know whether or not the price paid by the Chicago area utilities for gas coming from the Panhandle field is lower than the price paid by utilities in other localities for gas coming from the same field.

You ask whether or not if, it should turn out from further testimony to be offered in this case that the price of gas sold by the Natural Gas Pipeline Company to its distributors at wholesale is the lowest price at which gas produced in that Panhandle field is sold, I think it would be an important factor to consider in connection with arriving at a proper rate at which defendants should sell their natural gas. I think I can answer that along the same lines that I have already answered some of your questions. If I were setting about to form an opinion as to the rates of the company, if I had information as to these other rates to which you have referred, and if it showed that the other rates were much different from the Chicago rates, that would be of interest to me as a starting point to ask why those differentials are there—whether they are based upon justifiable reasons, or are something that is due to some other factor that is involved there; but in a proceeding of this kind it seems to me that you cannot try the rates of all the other companies that are dealing in natural gas.

You ask me to state just what I start out doing when I enter upon a research in connection with the problem of a fair rate of return. I start to collect information on various subjects that have been indicated to be elements to which some consideration should be given in forming a judgment as to a fair rate of return. You ask what elements I think should be given consideration.

I do not know whether I can recall a complete list, or I do not know whether I have arrived in my own thoughts on the matter at a complete list. One factor that has been mentioned by the courts is risk. In connection with that there are a number of subsidiary factors or points to be considered as matters upon which judgment can be formed as to the amount of risk. For example, the territory served. The nature of the product might have some bearing upon the risk. The nature of the operation. There are probably a number of other things that I do not recall offhand.

Courts, I believe, have mentioned cost of money. Financial history of the company. General level of interest rates. Economic conditions. There are probably others, but I just do not recall them now.

I have devoted my time to other phases or other elements and have not given consideration to the element of risk in my preparation to testify in this case. My testimony has no relation to risk particularly that I can see in connection with rate of return. Personally, I think risks should be considered. You ask whether I recognize that it is a fact that the present interest rates, present volume of idle money, or money not invested in industrial enterprises, the present volume of investments in the very highest order of securities, such as government bonds, short-term bank loans and corporate bonds of the highest ratings, indicate 1663 that the investing public is more concerned with safety and security of investment than return on investment. I do not believe I could answer that question categorically. I mean, there are lots of factors to consider as to why this thing is where it is. It is not a matter solely of risk; it is a matter of what is available. What is available is one of the factors. You ask whether I agree that there is a tendency to demand more compensation for risk at this time than in past years, relatively speaking. Frankly, I have not made studies adequate to enable me to answer that question.

This Aaa bond is called A-1 Plus by Standard. Moody's B bond is called B in Standard's, if I recall correctly. I have not studied the spreads between the yields on those two classes of securities at the present time as compared with recent years. I have not studied the spreads between the yields on A-1 Plus bonds and any of the other lower grade bonds. I have not made a check to determine whether there is a wider spread between the yield on the A-1 Plus bonds at the present time as compared with the yield on those lower classes of bonds, beginning with B, than a few years ago; but I would judge that it is probably a fact. That is attributable in part only, I think, to the fact that as you leave the A-1 Plus bonds and go in the direction of B bonds you are getting into risk considerations and risk elements. Without making a more comprehensive study of it, I hesitate to say that there is a marked tendency to avoid risk or to demand higher relative rates of return for risk as compared with rates of return on safe investments at this time than there was a few years ago. I mean there are a number of factors besides risk. Risk is a relative thing. The compensation demanded for risk may vary because of the degree of risk varies, and so forth. When I put this material together I do not think I had in mind the attitude of the investor toward the element of risk. I think I summarized somewhere this exhibit on interest rates to show it was merely intended to show the trend of interest rates of various kinds. I am not appraising this data. Obviously I have not formed a judgment as to the proper rate of return and therefore there has been no occasion to interpret it. I was asked to put in some information on interest rates. I do not know how else you can measure interest rates. These data are there for whatever weight and consideration other people want to give to them.

You ask whether I expected Mr. Kleinman to reach a judgment from my evidence rather than to reach that judgment myself. I have not even read Mr. Kleinman's testimony except that I am familiar with a brief section with regard to some risk factors. I do not know what rate of return he testified to. I don't know what use [illegible]. Kleinman made of my material or if he made any use at all of it. There might have been a tacit understanding that Mr. Kleinman would consider interest rates as a factor; and he might look at what I did or was going to do; but I don't actually recall that we had any formal understanding about the matter at all. The only thing I knew Mr. Kleinman was to do was to have some material in connection with risks of some sort or another on the general subject of rate of return testimony. That is all in the world I knew about it, not that it makes any difference; but I did not work with Mr. Kleinman before he gave his testimony.

I suppose Mr. Booth distributed the work that was to be done in presenting this testimony on rate of return as between Mr. Kleinman and myself. In part, I prepared what Mr. Booth told me to prepare. I mean, I testified to 1664 different things here. I can't recall that directly, because part of this work was done last spring with the thought that I would go on the witness stand right at the first. As I recall, Mr. Booth or Mr. Olmsted asked me to prepare some material on interest rates and some material on financing by natural gas companies, and submit information on money market factors. The other thing to which I testified was something I developed and suggested I would like to testify to; that is, the matter of those mathematics and this amortization problem. I suggested that to Mr. Booth.

I was told Mr. Kleinman would do something on rate of return. I did not know how he would go about it. I assumed that he would express a judgment as to what the rate of return ought to be; but I did not know actually that he would. I think I knew since that time by his testimony; but I didn't know actually what per cent he would actually name, if he named one. I did not know that. I don't know whether I was asked to determine affirmatively what the proper rate of return was. I don't think it makes any difference.

Last spring I believe I prepared some summary data from my studies on public utility financing, a copy of which I think went to Mr. Hedrick, with the thought that that might be included, but I decided later to withdraw it. The material I presented, with the exception of Exhibit 182, was prepared at the general direction of Mr. Booth, who told me to prepare something on interest rates. I think that is substantially accurate. Sometimes it is hard to draw a line when you are in a conference and discussion as to where the originating source was. I mean, we are not too formal over there on these things.

My testimony on cost of money was used in former rate cases. You ask what kind of capital money was involved in our studies on rate of return over at the Illinois Commerce Commission. I think the three principal types were bonds, preferred stock and common stock. Of course when we come to common stock we have a somewhat different problem than we have when we have the others. I do not have anything to do with the approval of securities up there. You ask how many financing issues have been referred to the Illinois Commission in the past four years. There have been a considerable number of them. I am only familiar in a general way with it, because it is usually listed in the Commission's annual report, for which I am responsible. As to volume, they have had largely to do with bond issues. In terms of number of issues I think that is true also. There has been stock issued for various purposes. I don't recall all the issues. I cannot tell you whether any new issue of common stock for the purpose of raising capital has been submitted to the Illinois Commerce Commission for approval during the past four years. Had such an application been submitted I would be apt to know something about it in a general way. Just how precise my knowledge might be I cannot say at this time. You ask whether or not I can ascertain whether there have been any issues of common stock referred to the Illinois Commerce Commission for approval for the purpose of raising capital in the last four years, 1936 to 1939, inclusive. That is going to be a tremendous job, of course. You suggest that I ask the secretary. He won't know. In order to answer your question I would have to make a detailed study involving weeks of work on my part.

You ask whether I think in connection with the overall
financing of a gas company that it is important to
1665 know whether or not there have been any applica-
tions for the approval of issues of equity securities
for the purpose of raising new capital. I think I have a general idea, if that is what you want. I am willing to say I am reasonably confident that the amount of new capital issues involved during this period has been very small, if that is satisfactory. I am not granting anything now about what that might mean or what the significance of that might be. Those are just the bare bones of the facts; whatever interpretation may be put on them is something else. I think there have been some, particularly by the smaller companies.

I was going to say that these compilations of the Commercial and Financial Chronicle on utility financing, new utility flotations, are split into refunding and new capital. But their classification is very bad from an economic point of view. It is reasonably sound from a corporate point of view, subject to numerous errors. But unfortunately, those statistics have gained wide circulation, and people look at them as being an authoritative index on the volume of new capital. But analyses have been made to show that they are pretty bad from an economic point of view. That is the point I am bringing out here.

I testified in a number of cases, as I stated on direct, with respect to such factors as cost of money. I think I have mentioned in my direct testimony all the cases in which I have testified on the cost of money. In every case in which I have testified, with one exception, I have testified as a witness on behalf of the Illinois Commerce Commission. In that one exception I testified as a witness on behalf of the City of Cleveland. I don't know how the case got to the Commission. The city had passed an ordinance and the company appealed to the Commission.

You ask whether I remember what my studies in connection with my work with the Journal of Land and Public Utility Economics revealed as to the kind of financing that has been going on in the past four years as between refunding and new money transactions. That study shows obviously that a very large portion of the total represents refunding financing. I want to also say that up until the last few quarters of my studies I predicated my figures pretty largely upon the Commercial and Financial Chronicle's compilations. After I became aware of how bad those compilations were from the point of view of new capital, I abandoned the practice of showing that index number, in which I showed the index of both new and refunding and total. I avoided that practice, and I avoided, if I recall correctly, statements of too categorical a nature as regards the volume of new capital financing versus refunding financing. I mean, I avoided being too precise about it; although I will still grant the great bulk of financing in recent years by public utilities has been of a refunding nature, for reasons which I think are apparent, but which I will not go into now. I would be inclined to think that that is true of other classes of business besides the public utilities. I haven't made the detailed studies, but I would suspect that that is true.

You ask whether or not it is more or less costly to raise additional capital by an issue of securities or to refund the existing indebtedness through the issuance of new securities. I think I know what you are trying to get at. It probably will require quite a dissertation to answer it. I recall, for example, this; quite a number of companies have brought out a number of different issues, I mean this
1666 year maybe an issue and next year an issue, and so
on, several times during the past several years. Now, I recall one case specifically where there were a couple of refunding issues, a new capital issue and then a refunding issue. The new capital issue was among the lowest cost issues for that particular company. I think in order to appraise that you have to realize money market conditions change during the period, too. I mean, as of a given instance of time what difference there might be as between the volume of new capital financing versus refunding issue for a given company, what differences, if any, would

depend possibly on fortuitous factors with regard to the elements to be taken into the computation. I don't know whether I make myself clear. I am trying to be as brief as I can. You ask what would be the difference in the cost to the company raising the original capital as compared with raising the same amount of capital in a refunding issue. I think again of this one instance. I just don't believe that the cost would have been very much different at that time for that company regardless of whether it was a refunding issue or a new issue, subject to the method by which you might measure cost. I mean when you measure cost on refunding issues there are various ways you can look at it, depending upon what you are going to include in the costs.

You ask whether, to apply the question to a natural gas pipeline company, I would agree that that part of the indebtedness represented by bonds would cost more through a bond issue at the time the pipeline was about to be started than it would after it was put on a going basis, everything else being equal. That involves, of course, a lot of assumptions, but I think if I understand you correctly probably it would cost a little more for the company to get money when it starts out than it does when it has been in business a number of years. I am not going to argue that question. The significance, of course, is something else. How you would treat it, and talking about taking into consideration the amounts involved and the changes in the money market and other developments in the investment field generally, and so on, I don't know how you would appraise it. You ask what is the comparative cost as between a refunding issue for the purpose of taking up an existing indebtedness and the cost of obtaining additional money for the purpose of making extensions and expansions by the same industry and at the same time. The thing I was talking about a moment ago depends upon the statistical methodology of comparing costs and it depends on certain of these fortuitous factors, the amount of the call premium, the amount of duplicate interest, and so on. I mean as of a given point in time and as of the same company, it is conceivable that company can afford to raise new capital and could raise new capital where they could not afford to refund an issue, if I make myself clear. That is on account of the cost involved in duplicate interest in paying off the premium of the old indebtedness to get possession of the bonds and other various refunding costs which I term somewhat fortuitous.

You ask which will sell at the lower yield to the investor ordinarily, an issue of bonds solely for the purpose of taking up an existing issue of a company which has an earnings history already accumulated, or an issue to raise additional capital for the purpose of making expansions with the hope of increasing the earnings. I frankly don't know that there would be any significant difference between the two. My studies have shown over the past several years that given companies have done just that, except that the refunding issue, of course, and the new capital issues were not exactly together in point of time. There might have been a lag, an interval of time between the two; but on
1667 the basis of that I don't think there has been any distinction of significance between the yield to investors on a so-called new capital issue and a so-called refunding issue.

You ask me to assume a company with $20,000,000 of capital, with $8,000,000 of bonds, and earnings times interest on the bond issue of 5 to 1. You then ask if that earnings times interest ratio would be a very important factor from the standpoint of the investor if he were considering buying a bond issued for the purpose of refunding that indebtedness. I should say the investor certainly would look to the interest coverage as one of the factors. I would not go as far as one of the company witnesses did before the Illinois Commerce Commission in which he said that because of their refunding, because of the lower interest rate and consequent improved coverage, an investor would want the issue, which is tantamount to saying if the company is now earning its interest one time, that is, earning its interest once, and obviously if they put out issues carrying half the interest they would earn the interest twice. I would not say that that is a factor which would induce the investor to go into the refunding issue. One of the factors in which he would be interested is the earnings times interest ratio in relation to that series in which he was considering investing his money. He would be interested also in the over-all picture. There are a great many other factors, of course. You ask me to assume that $8,000,000 of bonds is to be refunded by an issue of securities and that the earnings of the company show that the earnings times interest on a new issue of securities is 5 to 1, and ask whether or not that circumstance would enter into the price which an investor would pay for the bonds. Obviously, it seems to me investors would look at the interest coverage of an issue they were about to buy as well as look at a lot of other factors. That is only one. Just how they would weight it and appraise it is something else again. There is no denying they would look at that and consider it. It would have an influence on the price. I mean the amount of interest coverage requirements so far would have an influence.

You ask me whether, in the event that same company decided to expand with a view of increasing its revenue and at the same time as this refunding operation wanted to get $4,000,000 of new money to put into additional extension and expansion of facilities with a view of increasing its earnings, that second issue of bonds, in determining the earnings times interest, would have to be weighed in connection with the interest requirements on the refunding issue. I think an investor would give consideration to the fact that it is the second mortgage, certainly. He would take into account the whole financial position of the company. He would consider there was interest ahead of his and he would look toward the over-all charges upon the same. If there were debentures after his second mortgage, even though his claim is technically senior to debentures, nevertheless the company might by virtue of the debentures get into difficulties that would be embarrassing to the second mortgage, even though he might in reorganization come out with no reduction in his principal amount. Investors look at all those things. The earnings times interest would have to be figured on a basis of the earnings times interest on both issues in that sort of situation. If the first mortgage interest is being covered by a very nice margin the effect upon an investor as regards the coverage on his second mortgage is much less than if the first mortgage interest is not already being earned by such a good margin. The weight to be given there is something different from the fact that the weight would be given. You ask that if the earnings times interest ratio on the first issue is 5 to 1, the earnings times interest ratio in relation to the second issue would necessarily be less than 5. I don't think that is necessarily so. You just can't dovetail these things together as precisely as we are trying to do here. There is a presumption
1668 that the new capital being put into the business will also earn money. As a matter of fact, very frequently the financing is accomplished in this fashion. The funds used to construct the properties are advanced from

the treasury funds of the company and the treasury is replenished some little time later by the proceeds obtained from the so-called new capital issue.

As a matter of simple arithmetic, if in taking into account only the prior issue, the earnings times interest is 5, the earnings times interest would be less than 5 on the later issue. The arithmetic would be the same whether or not the second issue was tacked on to the open end of the prior issue. If the extensions were to be made with the hope that they would increase the revenues, any figures concerning the increased revenues at the time would necessarily be proforma, unless you have the situation I gave a little while ago where a new capital issue is raised for the purpose of reimbursing the treasury for capital expenditures already made. If we are doing this financing today, the earnings times interest is known because we have the earnings history right in front of us for the past year. I have already said, not taking into account certain factors that as a matter of arithmetic the earnings times interest ratio would be lower if we take in the $4,000,000 additional for the purpose of making extensions to be started as soon as we get the money. As a practical matter the company might project estimates of future earnings as a result of those extensions. The only way we could get that earnings times interest ratio back up to 5 would be to take into account some of those future earnings that are yet to be demonstrated as a fact.

You ask whether an investor would invest his money at a lower yield if the historical earnings sustained the relation of 5 to the interest than if a part of the earnings was yet to be demonstrated by extensions to be made in the future. It seems to me it is a matter of degree. I mean, I am willing to grant possibly for a short time a large addition to the funded debt would cause some decrease in the coverage ratio, but how large that would influence the investor is another matter. I have no particular objection to trying to answer the question. I think it is rather an interesting problem. There are many difficulties in trying to arrive at an answer. I am not just sure where we are. As far as I can recall I was attempting to distinguish between people giving weight to something and whether or not that would be an influencing factor. I think you have to look at these things from a reasonable point of view. If a company had a huge increase in its funded debt for the purpose of getting a great deal of capital, and if it were the investor's opinion the probabilities of earning on that additional capital in such an amount, I mean, if such amount exceeded the reasonable requirements of the company, he would give it more consideration than he would otherwise. If, as the thing stands, he has plenty of protection, if as the thing stands before the refinancing for the new financing he has good protection, then, he is not going to be concerned about a slight change for a short period because he will have to convince himself first that the company requires this additional capital and can employ it in a profitable fashion in its business.

Questions Interposed by the Examiner.

You ask me to assume that there are two investments available for a person who has money to invest; that the companies are identical, that is one has a total capitalization of $20,000,000 and the other has a total capitalization of $20,000,000; each has an outstanding issue of bonds in the sum of $8,000,000; the only difference up to that point is he can get several bonds of the first company and he can't get any of the bonds of the second; but the second company is floating an additional issue of $4,000,000 and he can acquire several of those bonds. With respect to the first issues he knows that the earnings times interest ratio
1669 is 5 to 1. He doesn't know what the earnings times
interest ratio is with respect to that of the second company after the additional issue. In the way of a price matter, as in which company he would be more inclined to invest, I just cannot make the categorical sort of answer that would on its face seem to be called for. There are so many factors that it is pretty hard to isolate one of them and say that that would be controlling. I do not think the distinction is so important as the tenor of things would seem to indicate, because there is always a thought certainly that the additional funds will earn money. There is always the question of the availability of the other issue. That is, here is a large insurance company that wants to buy a million or two or three millions of an issue, and the public cannot do that with the market conditions existing. They have to turn to new issues. Sometimes they are willing to pay a good price for them because they can get the quantity they want. I have known of bankers to so testify

in rate cases. I don't know whether that satisfies you or not.

I am willing to grant you that under the No. 2 situation, where there is new money raised, there is the possibility of a dilution in the times interest earned figure that the investor would consider, but there is a possibility of a reduction, at least for a while. I do not just like to say or to chop these things off too abruptly. You cannot be too absolute about them. They are considered, certainly; I would not deny that at all. How far they go in influencing an investor to make up his mind, I do not know, because there are so many other things.

Cross-Examination by Mr. Morgan Resumed.

You ask whether I think it is important to know whether it would influence an investor before I take those refunding rates of yields as a guide in fixing a rate of return for a company in a rate proceeding. I think some consideration should be given to that, if it is such a great possibility, and I think I have already said that that distinction, as a matter of fact, seems not to have been one that is an appreciable measure, looking at the actual facts of this period.

I have stated that the great bulk of the financing in the last several years has been of a refunding character. That refunding has been largely in bonds, debentures, and notes. They have been principally bonds or debentures of the higher rating groups, say from Baa on up. You ask as among the four classes listed by Moody where has the principal part of the financing been done. I haven't made such an analysis. I really don't know. I think there are some figures in the record on that.

(At this point counsel for defendants handed the witness a copy of Dr. Dorau's Exhibit #152.)

You have referred me to page 37 of Exhibit 152. I imagine that this correctly reflects what it purports to reflect in the way of factual information. From this exhibit I would say that the comparative volume of Aaa and Aa financing to the total is much larger during recent years than it was during the four years preceding 1929 or preceding 1930. If the A bonds be included as among the higher rated bonds, the bulk of the financing during the past four years has been in those three classes of bonds, Aaa, Aa, and A. A relatively small amount has been in

Baa and the lower ratings of bonds. You ask whether that circumstance should have any bearing on the weight that ought to be given yields in a rate of return study. I think one should examine the reasons for that and take those into account, whatever they might be. I mean the reasons for the increased relative volume should be taken into account. There might be several reasons for it. You ask whether it is reasonable to assume that the yields on
1670 the type of bonds that have been involved in these transactions would be smaller than on other types of bonds of lower ratings. I think that is a fact, that the yields are lower on the high grades than on the lower grades.

You ask that if we are examining a general curve dealing with the subject of bond yields, knowing that those transactions were largely refunding transactions and largely of the higher grades of bonds, it would be very important to take those factors into account in weighing the bond yield as an element entering into a rate of return study. I think that this shift in proportion here must be taken into account in appraising any data that purports to show the average yield on new issues. Just as I pointed out in my articles on financing, I believe you perhaps noted a number of times, both facts; that it is largely refunding financing, and largely refunding financing of the higher type securities. Those facts are pertinent to any interpretation of the average rate of yield on new financing over a period of time. I don't mean, though, that it does not have as much pertinence to bond yield averages of all types. That is something else. I mean yields on bonds such as I have shown here, and I have shown them down to the very lowest grade. You ask if we averaged the yields on the types of bonds which are involved in most of the transactions with the yields on the relatively small proportion of bonds of lower ratings and higher yields, whether we would get a true picture of the average yield on bonds. If I took the average yield on all new public utility bonds floated in 1938, and took the average yield on all public utility bonds floated in 1928, and compared those average yields, one of the reasons for the difference might be due to the difference in the composition of the material upon which the basis of average was made. I don't think there is any argument between us except as to the manner of stating the facts. I get a true picture as regards the average of what was done in one period as against another; but in comparing the things averaged, if it extends over a period of time, it becomes pertinent to go behind the statistical computation and see what was being averaged. Of course, there is no argument about that. I don't quite see your suggestion that that must be taken into account in appraising the trend of these bond yields over a period of years. I say that the change in composition must be taken into account in appraising the change in the average based upon all new capital. Now, you are going from that to bond yields on outstanding issues of all classes, and so forth. That is different. If you came to me and said, in 1938 the average yield on all new public utility bonds floated was 3 per cent; and in 1928 the average yield on all public utility bonds floated was 6 per cent; I would say, in order to explain that, of course, you have to look, among other things, at the comparability of the composition of the total as of the two dates; and the fact that it was predominantly high grade financing at one time, and less high grade at another, would be one of the factors that caused the decline.

You ask me as between bonds and preferred stocks what is the relative position of preferred stocks in the securities picture as compared with the period prior to five years ago. The volume has decreased. I would say that there has not been a great deal of preferred stock financing in the past few years. There have been some very important issues, however. You ask what is the relative percentage of the total capitalization represented by preferred stock in the new issues of securities during the past five years as compared with the period prior to the last five years. If I understand you correctly, I will say that to the best of my knowledge, without actually having gone into a very precise study of the problem, the percentage of capital stock financing to the total public utility financing during the past few years is probably less than it was prior to 1930, probably quite a bit less. I don't know the precise figures on it. I really don't know whether the preferred stock is a larger proportion of the total now than it was five years ago. I know that some preferred stocks have been refinanced, but that would not change the picture. If I recall correctly, some preferred stocks were replaced by
1671 bond issues, which would tend to increase the proportion of bonds, relatively speaking, and decrease

the proportion of preferred stocks, but beyond that I don't know. You ask if the practice of resorting to preferred stock in the issuance of securities during the past four or five years is resorted to more less extensively than prior to the past five years. I think there has been less use of preferred stock, if that is what you mean.

Common stock is what is commonly referred to as equity capital. The proper term is equity securities. There have been relatively few common stock issues. I have an idea as to the comparative cost of raising capital through common stock issues and through bonds. By and large, common stock money costs more. In so far as there is such a thing as cost of money on common stock it would be higher. If there is to be an over-all refinancing of a company's securities, the common stock would be one of the things that would have to be dealt with. If we were trying to arrive at the cost of financing on the basis of certain proportions of bonds, preferred stock and common stock respectively, as constituting what a witness has termed sound financial structure, the cost of raising the capital represented by the common stock would be one of the elements that would have to be considered. I think it would be just as important to determine the cost of raising capital by common stock for the amount represented by common stock as it would to ascertain the cost of bond issues for that proportion to be raised through the issuance of bonds. The full information concerning bond yields, after all allowances have been made for the proportion of bond transactions that have involved refunding and high-grade bonds, and for all of the other factors that enter into the weighing of the yields on bonds, does not give sufficient informtaion to arrive at the cost of the over-all financing of a given industry. A judgment would have to be formed as to the cost of the equity capital. This matter of cost of equity money or common stock money is quite a different thing from the cost of bond money, but with that observation I would say, yes, it is necessary to arrive at the cost of the equity capital. Bonds are contractual obligations in which you have definite prospects, definite promises, definite expectations, and by arithmetic you can arrive directly at a figure that we call cost. You cannot do that in the case of stocks.

You ask if it is more difficult to arrive at the cost of equity capital than it is to arrive at the cost of bond capital or a funded capital represented by first mortgage bonds. I think the point is that you cannot actually get what you call cost of equity money. You can attempt to appraise it and arrive at a judgment along those lines as to what a reasonable cost figure it. It involves a rather extensive study over a period of time. No such figures are readily available in the same form that bond yields are available. You ask why not go the whole way and exercise judgment about the cost through the issuance of bonds then, if the cost of equity capital has to be a judgment or opinion figure. I think one has to exercise judgment as to how far one goes in putting information in. As long as information on certain things is available, I see no objection to putting it in. If other information that requires a great deal of assumption in order to arrive at it, and a great deal of work in order to obtain it, is not put in, I do not see anything particularly startling about it. I think that by and large common stock money probably has what we might term a cost that is higher than high-grade bond money. I think high-grade common stocks probably sell at a better basis than the poorer grade bonds. It is all a matter of degree. Some common stocks sell on a very good basis.

1672 I am not sure that I know of any method of appraising the relation between the bonds and stocks as regards cost. I recognize that there is a difference between the yield to the investor and the cost to the company in the event of the issuance and sale of a bond issue. From my experience on new financing in recent years, the difference between the yield at which the securities were sold to the public and the cost of money to the company on the new capital basis averaged around two-tenths of one per cent. That is what I found in these articles on financing in recent years. In individual cases it goes to four-tenths of one per cent, certainly. I was talking about the average.

We do not have common stock yields in the sense that we have bond yields. You ask what we have in connection with common stock transactions from which we can arrive at something related to bond yields. There is a dividend yield which you can study, and also an earnings per share or dividend per share. There is also what is known as price earnings ratio. By the latter term is meant the market price of the stock dividend by the earnings per share on the stock. That is the simple one. You ask what would be the spread between the price earnings ratio on stock sold in isolated transactions such as occur in stock markets, for instance, and the cost of financing through the issuance and sale of a whole issue of common stock. I am not just sure.

It seems to me you might be able to work out something if you had enough data to find the relationship betwen the price paid by the investor for common stock and the proceeds to the company. In the same way, there might be expense in the case of common stock just as well as in the case of bonds.

You ask me whether I agree with the language you are reading from "The Problem of the 'Rate of Return' In Public Utility Regulation With Special Reference to the Long Lines Department of the American Telephone & Telegraph Company," dated June 15, 1938. You read first from page 79 under the caption, "Adjustments for Expenses of Marketing Securities" the following: "In the case of both bonds and stocks it is clear that the yields at market prices do not represent the total costs that the corporation would ordinarily incur in selling new securities on the market.". I have just stated that in substance, I believe. You then read, "The amounts realized by the corporation are less than the market prices by the amount of the expenses involved in issuing and selling the securities, and the percentage cost to the company is correspondingly increased over the yields at market prices. In the case of bonds, this differential is well recognized, but for common stock financing it appears that some further discussion should be devoted to this point." I might interject here on this one thing, that the amounts realized by the corporation are less than market prices because of expenses, and so on. There are once in a while some unusual exceptions to that. I believe I mentioned one this morning where a company sometimes could do better than market on a new issue because of the fact that someone might be willing to pay that premium in order to get a large amount or all of it, or something like that. I am speaking of bonds—just as an illustration.

You continue the reading, "The necessity for a margin over the earnings-price ratio on common stock seems clearly to exist, except in those situations in which a corporation could sell additional stock at the average market price. However, it seems probable that few corporations could ordinarily sell any substantial amount of new stock at the full current market price." I think I am generally in agreement, bearing in mind that the word "substantial" is used there. I might observe that when I was in the 1673 investment business we often did sell stocks at the current market. I mean, our inventory. We carried an inventory of stocks that were quoted on the market and we sold those at the market. Not only that, but we sold them without commission, I mean to the investor. If you put the whole issue on the market at one time there would be no market for the issue to be depressed. You say if you put the whole issue on the market then you assume that there has not been any of the issue outstanding to have made the market. However, if it is assumed that for the past few weeks there have been market transactions in a given stock and then today who holds it dumps the whole issue on the market, it would certainly not bring in as much money as if sold in isolated transactions.

You now ask if I agree with the following language from the same source from which you have been reading: "Offering of a large amount of additional stock on the market will tend to depress the price, since the delicate balance between demand and supply is easily upset, and corporations rarely attempt to sell any large stock issue directly on the market, it being apparently expected that, due to the resulting depression of the market price, this method would result in more expensive financing, over-all, then if the stock were sold in other ways." You ask if that does not mean that we have to make allowances for the price-earnings ratio that is evidenced by isolated scattered market transactions in appraising the cost or arriving at the cost of financing through the issuance of equity securities. I might agree with your point as to what you have to do. I do not think this evidences that. Let us look at it a minute. This talks about putting a large additional amount of stock on the market. I presume that is talking about an organized stock exchange, an organized stock market. I assume that. I would agree with that if you attempted to go and sell a great volume of stock through brokers on the New York Stock Exchange that it would tend to depress the price of it, certainly; but it says right here that that is not the method followed. The distribution is made through other methods, through bankers and brokers who would distribute the stock, and they would do it at or very close to the market. I know that it has been done in some cases.

You ask if it is not true, as stated in the source from which you are reading, that "If the new stock is sold through underwriters, it may be assumed that some fee or commission will be charged." I think that is true. You then continue reading from the same source:

"When new stock is offered directly to present stockholders, the offering prices are customarily less than market prices, apparently on the theory that some margin must be allowed in order to assure the absorption of the stock.

"Furthermore, in determining the fair rate of return, it does not appear that this necessary 'margin' allowance can be restricted solely to additional stock to be sold in the future, if reasonable costs of new capital are to result. Potential investors, willing to buy the stock at a certain earnings-price ratio, would tend to ask higher returns, if they were to become aware that, as soon as the corporation had their money, the earnings would be reduced until such time as still more new common stock money was needed.

"The conclusion that the allowed return should include an additional allowance over and above the precise earnings-price ratio on common stocks represents a direct reflection of the market conditions apparently in contemplation by the Massachusetts Department of Public Utilities, when it remarked that:

1674 " 'In determining what amount of dividend is necessary to attract capital at such a price (that is, a price at least as high as the average amount per share paid into the company's treasury by the stockholders) regard must be had for the fluctuations likely to occur in the market price by reason of new issues being placed upon the market.'

"Certain investigators have interpreted the Massachusetts doctrine respecting return on common stock as requiring a limitation of such return to levels just sufficient to maintain average market prices close to par value or issue price, and at least one fairly recent decision apparently lends some color to this view. However, as early as 1925, that Commission clearly recognized the actualities of the situation when it remarked that a corporation's shares of stock will not sell in large quantities at par unless small quantities sell in the stock market somewhat above par." And the Commission added:

" 'Hence it follows inevitably that the company must earn such an annual dividend as will maintain the price of shares of its stock above par in the stock market. Such a dividend demanded by economic necessity is, in substance, what courts call a fair return.'

"The magnitude of this 'marginal' factor with respect to both bonds and stock has been studied by reference to the terms of actual security floatations regarding which the data as to costs of financing could be obtained. These studies are presented in the following chapter."

"The preceding data on costs of common stock financing cover a very limited number of cases. Nevertheless, all the data on this point which could be unearthed during the time available for this study has been analyzed and it is believed that such data suggests certain definite conclusions. It appears that a strong, well-established utility, with good credit, could market reasonable amounts of new common stock, under ordinary market conditions, at a total cost not exceeding 12 per cent of the amount realized by the company. This would allow for a discount of 10.7 per cent from market prices to cover: (1) If the issue is sold through underwriters, discounts and commissions to underwriters (estimated at 5 to 7 per cent), other expenses of the issue (estimated at one-half of 1 per cent), and a margin between market prices and offering prices of 2 to 3 per cent; or (2) If the issue is sold directly to stockholders by means of rights, a margin between market prices and subscription prices of 7 to 8 per cent, other expenses of issue (one-half of 1 per cent), and underwriting costs of about 2.5 per cent of the amount received by the company. A margin between offering prices and market prices on issues sold through underwriters may not be necessary, but such a markin has nevertheless been provided for. A similar comment applies to underwriting costs in the case of stocks sold through rights to stockholders.

"While these allowances appear to be ample in the case of stock issues of reasonable amount to care for new capital needs, such as are assumed in the study of experienced capital costs of selected companies in Chapter VIII, there may be a question whether a margin of 12 per cent would be sufficient in the case of a wholesale recapitaliza-
1675 tion, or 'reproduction' of the capitalization, over a relatively short period, such as is assumed in the analyses of current over-all costs in the best investment situations in Chapter VII. Accordingly, 15 per cent was used in the calculations of the latter chapter to cover costs of common stock financing."

(Counsel for the two Commissions objected to the character of the cross-examination by Company Counsel on the ground that it is not directed to the direct examination and tends to delay the proceeding by the reading of long quotations into the record. The Trial Examiner ordered portions of the objections made by Commission Counsel physically deleted from the record over objection to such procedure by Commission Counsel. Portions of the following questions by the Examiner were objected to by Counsel for the Illinois Commerce Commission.)

Questions Interposed by the Examiner.

In my exhibit on natural gas companies' financing I may have mentioned common stocks and preferred stocks that they issued. I don't know whether I stated anything about cost of the common stock or not.

You ask whether an allowance to the effect that a number of statistics are presented to the Examiner regarding the present price earnings ratio of common stock—whether there should be further considered an element which is called, in the study from which counsel has been reading, a total cost; and whether from my investigation in connection with this and other cases I am prepared to say whether that total cost should approximate 12 per cent of the amount realized by the company. I believe that I would say that if in this case or any other case statistics were presented to you purporting to be earnings price ratios on common stocks, that you should make a careful appraisal of those figures. In all probability I do believe that you should allow something in addition to those figures for the fact that the companies might not receive the same proceeds as they would if they obtained market prices. You should consider also as of any given time the earnings price ratio may not be a very reliable measure of the cost of money. You would have to look at it over a long period of years, because the price of the stock reflects not only the interest element, but in times of rising prosperity it reflects hopes; in times of declining prosperity it reflects despair; and the instantaneous ratio is looking to the future so much that you can't take that as a measure of what the investor has in mind. He is discounting the future; and the rate at which he is discounting the future is probably more important than the nominal rate at the moment.

As I understand it, this figure is not the cost of money; this 15 per cent is not the cost of money. It is the so-called financial cost, discounts, commissions, and so on. As of any time of financing I don't think it would particularly affect the amount of that cost. You ask whether I have any idea what that amount today is. I couldn't say whether this 15 per cent is right or not, without making a more detailed study than I have made. In looking this over some of these figures look a little high, and some of them look a little low.

Cross-Examination by Mr. Morgan (*Resumed*).

I know what they are talking about in the volume from which you have read when they use that term 15 per cent there. (Objection by Counsel for Illinois Commerce Commission overruled.) You ask whether that 15 per cent as the term is used there refers to the allowance that must be made over and above price earnings ratio as indicated by market transactions in order to arrive at the probable cost to the company of raising equity capital through common stock issues.

(Counsel for the Illinois Commerce Commission objected to the above question and instructed the witness not to answer on the grounds that it is highly improper cross-examination on the part of Company Counsel and the Trial Examiner. The instruction not to answer was then withdrawn, although Counsel for the Illinois Commerce Commission presented his objection to the impropriety of the question.) I am going to have to study the whole report and give my opinion as to something that is contained in it. That is an awful burden and I am not anxious to take it. This report has been published several months and I haven't had an opportunity to look at it. (Commission Counsel then thereupon requested an opportunity to state his objections but the Examiner characterized his objection as "captious." The question was then re-asked by the Examiner and the witness thereupon made the following answer.)

My interpretation of this 15 per cent figure is that it is not a figure that is added on to the earnings price ratio figure; but it is a figure that for the purpose of some calculations made in this study they have used to increase another figure by, namely, the earnings price ratio; in other words, they would take 115 per cent of the earnings price ratio. I don't know anything about what sort of earnings price ratio they were taking, but I am just giving you my conception of what the arithmetic is. In other
1676 words, if you add 15 on to the 10 it would bring you to 11½ per cent.

Redirect Examination by Mr. Slaff.

I thought I had said before that for certain purposes the member of the staff that was preparing that portion of Chapter 7 used that figure of 15 per cent.

Redirect Examination by Mr. Booth.

I didn't say that I disagreed or agreed with that statement. I haven't made an adequate study to come to a conclusion on that point.

Cross-Examination by Mr. Morgan (Resumed).

I don't believe you have asked me to agree to it. I think I did make some comments on some of the elements that go into that 15 per cent and stated some of them looked a little high and some of them looked a little low. I think the burden of the inquiry has been as to the process of arithmetic rather than the equity of anything for the purpose of this proceeding.

Questions Interposed by Mr. Slaff.

You read from page 87 of the same report from which Mr. Morgan was reading a little while ago, the following language: "The conclusion reached from the preceding analysis is that during this recent period the effective cost of capital obtained through bond issues of large size typically includes .16 per cent for cost of financing. For the purpose of adjusting yields to investors at market prices to the basis of current cost to the company, two-tenths of one per cent appears to be a sufficient margin to represent cost of financing in the great majority of situations." You ask if that is substantially what I testified to earlier before the recess. I testified to two-tenths of one per cent as being the spread on new financing in recent years between the yield rates at which securities were offered to the public and the cost of money on those same new issues to the issuers. I wasn't talking necessarily about market yields on other securities.

Cross-Examination by Mr. Morgan (Resumed).

I was talking about bonds very largely at the time. I might include some debentures. I was not talking about common stock transactions. You ask whether I agree with the conclusion reached by the committee as to the spread between the bond yield to the investor and the cost to the company of the bond proceeds. It appears in my studies I have come out to very closely the same answers on this point as were stated in the paragraph. I am just noting now for the year 1936 I computed the cost of money average of 3.73 and an average yield of 3.55, there being a difference of .18. For 1937 the difference on the corresponding basis is .17 and for 1938 the difference is .16. I testified to two-tenths of one per cent in rounding it off a little bit. It comes to about two-tenths of one per cent.

The first page of Exhibit 180 appears from the caption to deal with prime commercial paper, prime bankers' acceptances, time loans and call loans. You ask if this page shows that the interest rates in transactions involving those securities have declined in recent years. I don't recall just for sure but I think it does show those interest rates have gone down in recent years. You ask whether the terms upon which that kind of paper is accepted by investors or banks changed during the period through which the interest rates have been going down. I don't know whether they have or not. I don't know what they would be. As I understand it, some of these are unsecured loans and some are secured. Whether there has been any change of any significance there, I don't know. You ask what type of unsecured loan is found in transactions of a character referred to in page one of this exhibit. Prime commercial paper is, I think, ordinarily unsecured. I am not so sure about the bankers' acceptances. They might be secured in some cases. The time loans may be, but those 90-day time loans are usually brokers' loans and there ordinarily is some hypothecation of securities behind those. Call loans, I don't know offhand.

1677 You asked whether the specification as to whose paper it is is the same as it was a few years ago when the interest rate was 3½ to 4½ percent. I don't know precisely whether it is or not. Just to take call loans, for example, I don't know whether they have changed the list of brokers to which they made loans.

I think probably there must be individuals who borrowed on commercial paper in 1925 who could not borrow on commercial paper now. It might be just the other way around, maybe some borrowing now who could not have done so in 1925, because of changes in the individual borrowers that we are talking about there.

You asked if I didn't know that this kind of paper is now being accepted only from those whose paper is of the very highest order. I think that has been pretty generally true all along. This refers to the prime commercial paper as of any date. It has been the highest type of commercial paper and not only true now but true ten years ago. I don't know whether the requirements to qualify as prime commercial paper have been greatly changed since the 20's. It is possible.

You asked what in my judgment does this type of interest rate have to do with the cost of an overall financing of the capital structure of a natural gas pipeline company. I think, as I said on direct, this information, as well as all the rest of this exhibit, was merely indicated to show interest rates, trends thereof, and just how this would go precisely to the rate at which any company might refinance is a rather indirect relationship to this extent; that is, in the whole money market over a period of time influences in one segment tend to spill over into the other segment, so to speak. What I mean is money tends to seek a level and if the rates are out of line in one place, money will tend to go to that end drive it down, and so on. In other words, these being short-term rates they are for short terms subject to different influences than long-term money rates are, I presume, but I think over a longer period there may be some similarity in trends, and certainly if high grade bonds were yielding five or six percent now people would be less willing to buy commercial paper at the lower rates, which would tend to have the effect of raising the commercial paper rates. There is some inter-relation in the money market between these types of loans. It is a limited one, and subject to a lot of influences, but that is above the best explanation I can give on that.

The congestion of money in the banks at the present time, concerning which I have testified, which is lying there idle, might have something to do with the interest rate that is prevailing for this type of paper. I don't think you could say flatly that it is entirely possible that these interest rates indicate an unwillingness of those who have money to invest it in long-term securities. It might be conceivable. I think it is the real indication of something else. Of course, you want to understand that some of these investors, particularly those who do have the money available, have some limitations upon what they can invest in, technical limitations, legal limitations and so forth.

The demand for new capital has been definitely reduced. That, of course, reduces the fields open for investment by the people who have the funds to invest.

1678 You asked whether I think that in order to use this page 1 of Exhibit 180, that we must go back of the figures there and look into the character of the borrower, the supply of money and the attitude of the owner of money toward making other types of investment than those reflected here, before we can properly appraise the value of that tendency in the interest rates in relation to the raising of long-term money. I have tried to state clearly what relation this might have to other interest rates. I do not know that I can expand on it any more than I have. I have attempted to bring out what inter-relation there might be in the money market among the several kinds of interest rates prevailing at any one time.

You asked what I think it indicates as to the trends of money costs for long-term money. It does not indicate anything directly. I tried to explain that a while ago. It is an indirect relationship. If it indicates anything at all, I don't think we would have to take into account a number of other factors than the mere figures. The figures themselves indicate on the face of them. I have not set out in there the yield on long-term money.

One of the objectives in this proceeding is to arrive at the cost of long-term money. In order to give whatever weight should be given to the cost of money as a factor in rate of return, it would be necessary to arrive at some judgment as to what the cost of money might be. It doesn't necessarily follow that that is why this tabulation and the other tabulations contained in Exhibit 180 are here. They are here to show the trend of interest rates. That is a factor that has been mentioned, just as well as the cost of money. Whatever weight the Federal Power Commission gives to this is up to them. I don't know. They may throw it out altogether. If you are interested in the trend of interest rates, you ought to take several different kinds of interest rates.

You asked whether or not the interest rates shown on page 1 of Exhibit 180 indicate that the interest rates on long-term money are going up or down. I cannot say any more on that than I did a while ago with respect to the inter-relation of the interest rates on one type of obligation to the interest rates on another type of obligation, as regards trends over a period of time.

I expected those who have the responsibility of weighing this evidence would give it whatever consideration and weight that should be given. If they want to know something about interest rates, as a factor in rate of return, here it is.

Questions Interposed by the Examiner.

You asked what I meant when I said a while ago that this information on short-term interest rates has only an indirect relationship. I am talking about the inter-relation of various kinds of interest rates and yields. The point I was trying to make, at the risk of being too brief here, is that if rates of interest were out of line in one direction, money would tend to flow there and drive those down. What I mean is, you would not find high-grade securities in one field way up here and high-grade securities in another field way down here for a long period of time. They would tend to equal out, because money would turn from one to the other. There is a certain amount of competitive factors in the money market with regard to securities.

1679 If long-term bonds decline in yield steadily over a period, you would naturally expect some decline in the short-term rates. I mean, the two would not get out of line too far over a period. That is, within a given year, of course, short-term rates are more sensitive; they may jump up and down within a short period, different from the direction and scope of long-term interest rate movements.

Cross-Examination by Mr. Morgan Resumed.

I did not put in this page 1 of Exhibit 180 on the theory that it indicates that interest rates, such as are involved in this inquiry, are lower than they were a few years ago. I am not saying what it ought to be used for, beyond information as to the rate of interest. I brought it in here because I thought it was pertinent to the matter of the trend of interest rates. I am not using it.

Page 2 of Exhibit 180 deals with interest rates charged to customers by banks in principal cities. This differs from the interest rates reflected on page 1 in that it has to do with direct loans, rather than commercial paper in circulation. These are over-the-counter loans rather than open market. These interest rates are lower now than they were in 1920.

You asked if I think the borrowing of money in an over-all sense is now being done by the same class of borrowers as was the case in 1920, when the rates were 6.71 in New York and more than 7 percent in the other cities reflected on this page of the exhibit. I would say they are probably the same classes, broadly speaking; that is, they are businesses and individuals. I think possibly the people who were borrowing back in 1920 were harder pressed and probably did not have the credit standing that some of these people do today.

You asked if a great deal of lending of money by banks in 1920 and for many years after that was not to a type of borrower from the standpoint of financial responsibility who would not be extended credit at all by the banks at the present interest rates. I would hate to say that it was or was not. That is a pretty big question to ask a man.

Questions Interposed by the Examiner.

You asked if it is generally known in banking circles that bank requirements are more stringent today upon that type of borrower than formerly. That may be. I do not know. I would hesitate to say that that was true. It seems to me there is more to it than appears there. The appraisal of the difference in that thing is a pretty difficult task. You have got to consider the standing of the prospect of the thing and of the man. Perhaps borrowers cannot show today that they can employ the money profitably, and other things like that. There are a great many factors to be considered, and just what the reasons are is pretty difficult to say.

Cross-Examination by Mr. Morgan Resumed.

You ask if I am not willing to admit that it is more difficult to borrow money at a bank across the counter at prevailing rates today than it was in the '20's. I just think that is too broad a generalization to be answered cate-

gorically. The difficulty is relative to a number of things. I just simply cannot make any better answer to the question. For some individuals it may be much harder, for others it may not be as hard as it was in those days. For
a given situation it may be easier to get it now, be-
1680 cause the banks are more in need of loans. Money
was pretty tight back in 1920. I dare say there were borrowers in the '20's who could get money much more readily than others. That is always so. All those who could get money at 7 percent in the '20's probably could not get it at 2¼ percent today. You are tracing down individual borrowers, and you just cannot do that sort of thing here.

I do not know that I can give a definite answer as to whether that is true as to the whole class of borrowers whose interest commitments make up the averages that are set out on page 2 of Exhibit 180. The 2.24 percent interest rate as of February of this year is an average. You ask if some of them are getting it for less and more of them are getting it for more. You cannot tell from an average, ~~particularly a weighted average,~~ what the dispersion above and below the average is with respect to individual borrowers.

I have read the Federal Reserve Bulletin. I probably looked at the September, 1939 issue of that publication. You have handed me the September, 1939 issue of the Federal Reserve Bulletin. You have read to me the following language from that issue.

"In New York City, although the average rate is around 2¼ percent, about 60 percent of the money lent to commercial borrowers is at rates between 1 and 2 percent and less than 15 percent at rates above 3 percent. About 20 percent of the borrowers pay low rates between 1 and 2 percent or about the same number reported in each of the rate groups shown in the chart.

"In the seven other northern and eastern cities, about 30 percent of the funds being lent for commercial purposes is at rates between 1 and 2 percent and 60 percent at rates from 2 to 5 percent, with but a small amount at higher rates. Only a few borrowers get the lowest rates and about 60 percent pay over 5 percent, the most numerous paying rates of 6 to 7 percent."

You ask what is the reason, in my judgment, for some borrowers getting money at between 1 and 2 percent and others, 60 percent of the whole number, paying 6 to 7 percent. I think the largest factor in the difference, belonging to the same general class and so on, is a matter of risk or a matter of the lender's appraisal of the risk. These lowest rates that you mention here certainly could not contain much compensation for risk.

You ask whether there has been any variation in the size ~~of the loans~~ during the period covered by this chart. I do not know as to what the information is as to size.

Page 4 of the same exhibit has to do with discount rates of the New York and Chicago Federal Reserve Banks. You ask whether there is any material difference spread between the rates in these two cities. Right at the present time the rate in New York of the New York Federal Reserve Bank is 1 percent, as compared with 1½ percent in Chicago. I think that reasonably uniformly in the past the Chicago rate has been a little more than the New York City rate.

1681 You ask if I know the conditions upon which a member bank can borrow money through the rediscount operations of the Federal Reserve Banks. There are different ways. I do not know all the precise routines and so on; but the Act, as I recall it, sets down certain statutory requirements, broadly, as to what can and what cannot be discounted. It is short-term paper. These particular rates apply to short-term paper and agricultural loans and industrial and commercial loans and what not. But these, I think, are relatively short-term. I think possibly in the case of some agricultural loans they might go up to as much as six months, but ordinarily it is 90-day paper. I don't think they will accept loans or will accept for rediscount paper that is based upon the financing of security transactions. I think it has to be commerce and trade or agriculture.

The member banks are not permitted, except by indirection, to borrow money through this procedure, for the purpose of lending it to customers who would use it in the acquiring of securities. They might have some eligible paper that they could take down and discount. They might use those dollars. I don't know whether they could or not, but it is conceivable they would use those dollars to lend, mix them with the general funds and then average them out. That would be by indirection. I don't think they can.

You ask whether these rediscount transactions have a remote relation to the cost of long-term money through the issuance and placing of securities. I do not like to argue about the word "remote". It is still a very indirect relation. There are other things here. For example, banks can also borrow by discounting their government holdings. So this thing consists mostly of potentialities. I believe I said on direct that the banks are in debt only a few million dollars to the Federal Reserve, whereas back in the '20's they operated on a large volume of debt to the Federal Reserve. These things are not very effective now, as I stated on direct.

I think I said there was something like five million dollars being obtained through the rediscounting of paper by member banks through the Federal Reserve in 1939 as against one or two billions at the end of 1928. So the banks practically have no debt to the Federal Reserve as a whole. Of course, as regards an individual banker, if he is in debt, this thing is just as important to him as to anyone else. I mean to an individual banker it might be very important; but in the economy as a whole it is not important.

You ask whether it is my view that the yield on government bonds is significant as bearing upon the cost of long-term money. It is no more significant than any other interest rate. The point is that it is one of many rates of interest yield and should be considered along with all others, of course, but over a period you still have this same indirect effect. I mean, if yields on government bonds were to fall very sharply, less and less people would be willing to buy at those prices. They would want more and they would, therefore, turn to other sources, namely, corporates and other investments, and tend to drive those down. That is the point I have been trying to make all the way through here.

You ask if government bonds, as a matter of fact, are not sold on a sustained market. There has been some support from the banking system for the prices and market on government bonds. How far they go I do not know. I think it is commonly recognized that the Federal Reserve 1682 System has participated in effecting this cheap money policy of the government in recent years. There is no argument about that, and if you will look in one of my other exhibits, you will find how much the holdings of the Federal Reserve System are with respect to the U. S. government bonds. For long periods there it does not change in total volume at all. There was some change in the fall of this year when the market broke. There was some increase in the amount of Federal Reserve holdings of U. S. government securities along about September when the market was breaking. It has since gone down a little bit. I mean, they have since liquidated a part of the holdings, I think.

I think I remember seeing something in the daily press that the Federal Reserve System for the time being was withdrawing its support. Just what it was precisely I do not know. I do not know just when this support was resumed, but I think as a general proposition the support was resumed and the decline in prices was immediately checked. Just what the time was, I cannot say.

You ask whether I don't think it would be extremely dangerous to rely on the yields of government bonds under those circumstances as indicative of the trend of interest rates on long-term money. They are perfectly reliable as the measures of the trend of interest rates on long-term government money, and going back to the same proposition again, over a long period of time if governments fall you could probably expect other high grade liens to fall too, because of various strata in the market, of people who have different ideas as to what they want on their money. If one sort fell below that they would go to another, and so on.

(December 2, 1939.)

(At this point counsel for defendants produced a letter from Mr. C. J. Peterson and stated to the Examiner that it was in response to a request by the Examiner or by counsel for one of the Commissions in explanation of the ideal cross section offered in evidence as EXHIBIT 16. Counsel requested that the letter be read into the record. The letter was dated November 29. At the direction of the Examiner the letter was read into the record. It follows:

"When I was up in Chicago, a short time after I had been on the stand I furnished copies of the logs used in my cross section of the Panhandle field to the Examiner for the Federal Power Commission. I believe these were handed to the Examiner by Mr. Garver.

"These logs, beginning at the left hand edge of the cross section, were numbered from left to right Nos. 1 to 14, inclusive. In checking up these logs the other day I find that one of these logs I furnished did not belong to the cross section. This log which was handed in in error was Log No. 10 and is the Stubblefield Shell Jordan No. 1 well, located 330 feet from the south and east lines of the Southeast Quarter of Section 104, Block 4, I. & G. N. Survey, Carson County, Texas. The log which should have been given the Commission is Timms Jordan Brown No. 1 well, located 330 feet from the southeast corner of the Northeast Quarter of Section 104, Block 4, I. & G. N. Survey, Carson County, Texas.

"I presume this matter should be corrected and I am enclosing herewith eight copies of this Log No. 10 which should be substituted for the Log No. 10 which I formerly submitted."

1683 Counsel then requested that the log referred to in the letter be substituted for Log No. 10 formerly submitted by Mr. Peterson in his Exhibit No. 76. At the direction of the Examiner, the log produced was marked Exhibit No. 200 and was received in evidence without objection.)

You ask whether I know the names of the fifteen cities whose bonds were included in Column 2, page 5 of Exhibit 180. I put those in yesterday. The City of Chicago apparently has no bonds in the list.

You ask whether I know the comparative amounts of government bonds held by banks now as compared with 1929. As of March 27, 1929, all member banks of the Federal Reserve System held $4,454,000,000 of United States government direct obligations; as of December 31, 1929, the corresponding figure was $3,863,000,000. As of December 31, 1938, as shown in Exhibit No. 183, Table 7, the holdings by all member banks of direct obligations of the United States Government were $10,882,000,000.

On page 6 of Exhibit 180, in the caption I refer to the Annalist Average of Yields on ten high grade railroad bonds, 1857-1939. The Annalist is a weekly financial magazine published by the New York Times Company. By the term "high grade", as used in the caption, I understand that to mean the most choice or the best long-term bonds available in the railroad bond field as a whole. It is the top of that particular market, I would say. It is the top of the bonds of that industry.

When on page 7786 of the record I stated that the purpose of that exhibit was to present the longer-term picture of yields on what might have been considered fairly high grade type of long-term corporate bonds. I don't believe

I intended the word "fairly" to detract from the quality. What I had in mind was bonds considered by investment circles generally to be the higher grade bonds. I dare say a number of them probably would be found in the group of Moody's Aaa bonds, more particularly in the public utilities list at the moment than the railroad list. The list of bonds going to make up these figures has been reduced from 10 to 7 this year.

The reason for that I know only in a general way. I speak broadly from my own interpretation of what the situation is. I feel it is probably due to the fact that the number of bonds in the railroad field now considered of such high grade and also meeting the statistical requirements in the average is probably getting so small that they found it desirable from a statistical point of view to reduce the number to seven. I have some extracts here somewhere from the Annalist where they talk about that a little bit, if you want to look at that and read something into the record from it. I don't know whether or not the three eliminated were the bonds of three railroads which run out of Chicago.

You state that the railroads whose bonds were eliminated are: The Chicago, Burlington & Quincy Railroad Company; Pittsburgh, Cincinnati, Chicago & St. Louis Railroad Company; and New York Central & Hudson River Railroad Company. At your request, I will check and determine whether they are the three railroads and also whether all of these railroads run out of Chicago. I think they all have terminals and railroad tracks and trains running out of Chicago.

You ask if the yields of these high-grade bonds shown on page 6 of the exhibit have declined over the past several years. In this particular series the decline is not uniform certainly over the past decade, we will say, or fifteen years,
even, in that in 1939 and probably also in 1938, the
1684 averages in this particular series are higher than
they were in 1936 and 1937. There have been only those two years when the yields of those series of railroad bonds were lower than in 1938, unless we count 1935 when they were practically the same. It may well be that some of these bonds had earnings times interest in series of the prior issues of sometimes eight and ten times.

You asked whether or not if we compare the yields of this series of bonds with the yields of the 40 bonds used by Moody's as a part of the 120 bonds that are so commonly used in statistical studies, we would find them to have the same yield. Moody's list of 40 bonds, if there are 40 in there at the moment, would undoubtedly have a higher yield than this series on page 6 here.

On Chart No. 5 of Mr. Knapp's Exhibit 185 it appears that as of August, 1939, the yield was about 4.41 on the 40 railroad bonds. You ask then if this page 6 of my Exhibit 180 is not just another illustration of low yields on the very highest type of the class of bonds under consideration. I think the question is a little bit argumentative. I would say probably that for high-grade railroad securities the yields presently are not so low in relation to other high-grade yields, so the primary purpose here was to present a longer run picture of yields. It is an illustration of comparatively low yields on securities. These are lower than the yields on the poorer grade of securities, definitely. And they are also higher than the yields on the high grades in other lines. It is one of the few lists with which I am familiar that goes back as far as 1857. I do not know right now whether I could name another very readily. I believe there are others.

It is true that these low yields reflected by this chart have to do with the highest grade of securities in the railroad field.

The Annalist has some figures dealing with high-grade public utility bonds also. These are dealt with on page 7 of this same exhibit.

The term "high-grade" on that page means what it does in the tabulation shown on page 6. I think it likewise means that the bonds chosen were those that in the opinion of the Annalist were the cream of the crop. They are not representative of all utility bonds.

You ask if allowances would have to be made for that circumstance in the use of these yields for any purpose looking to the arrival at a proper rate of return. I think, as I believe I said yesterday, that insofar as interest rate yield figures are used by anyone in any fashion in forming a judgment as to fair rate of return, he should look not to one series alone; he should not look alone to high-grade securities; he should not look alone to low-grade securities. He ought to get a fairly informative picture so he would have some judgment in his own mind as to what prevailing levels were in various fields. I think there are really two things involved. The yields of the highest grade of securities are sometimes said to reflect money rates, whatever the economist may say that means, whereas on the lower grade you get a reflection of credit. Now, if one is interested in the money rates as such, presupposing that his interest is directed toward obtaining an elimination of extraneous factors, such as risk, then he would want to look at the high-grade, particularly, I think. But that is only one of the various factors there.

1685 You ask whether this yield continued on through September and October at this same level of yield at 2.85 that prevailed in July and August. I think I brought that down to date on my direct. I have a figure here for the week ended September 23, 1939, of 3.26 per cent, and that was about the peak that it reached, because the bond market reached its worst point about the end of the third week of September. Whether this is the worst point or the best point is all from the point of view.

The bond prices reached their lowest point on September 23, 1939. For the week ended October 14, 1939, the corresponding figure was 3.10 per cent. Of course, that is over a month ago now. I do not have here with me any later information, I believe. I would say it probably has not got down to 2.85.

All these figures are taken from current market quotations and not from yields to investor at the time of original issue. I do not know what percentage of the total capital of the companies included in this list of ten high-grade public utility bonds was raised or represented by the issues involved here.

That would not necessarily be an important factor to know about these bonds before the yields are utilized for any purpose. This is defined as high-grade now. Presumably they have been selected on the basis of whatever tests the compiler used. He probably has taken some of those things into account in arriving at the definition of high-grade.

The property coverage as well as the earnings coverage has something to do on whether or not a bond is high-grade.

You ask whether I would expect bonds of this character to be a very high percentage of the total capitalization. I should not think it would be anything like 75 per cent. It is probably less than 50 per cent. I do not know how much less than 50 per cent it was. I do not have a list of the bonds covered by this page 7. I have written the Annalist and they have not favored me with a reply. I do have an extract, a sheet from the issue of the Annalist of February 1, 1939, in which they have an article entitled, "The Annalist Average Net Yield on Ten High-Grade Public Utility Bonds," in which they present that thing for the first time, I believe, and they do publish a list there.

The first issue is Bell Telephone First and Refunding 5s, 1960, Series C. It does not say what Bell Telephone Company. I asked the Annalist about that in a letter to which I have had no reply. I checked through Moody's Manual to see if I could find a Bell Telephone Series 6, 5 per cent, due in 1960, and upon the basis of this check I would think the bond referred to here is Bell Telephone Company of Pennsylvania, as it has such an issue. The next issue is Cincinnati Gas & Electric First 3½s, 1967.

(At this point the Examiner directed the reporter to incorporate the names of the companies listed and, in pursuance of such direction, they were listed as follows:)

Bell Telephone First and Refunding 5s, 1960, C.

Cincinnati Gas and Electric First 3½s, 1967.

Consolidated Gas, Electric Light and Power, Baltimore 3¼s, 1971.

Dayton Power and Light First and Refunding 3½s, 1960.

1686 Duquesne Light First 3½s, 1965.

Edison Electric Illuminating, Boston First Sinking Fund 3½s, 1965, A.

Illinois Bell Telephone First and Refunding 3½s, 1970, B.

New England Telephone and Telegraph First 4½s, 1961, B.

New York Edison First and Refunding 3¼s, 1963, D.

Pacific Telephone and Telegraph Refunding Mortgage 3¼s, 1966, B.

Page 8 of Exhibit 180 has to do with all of the bonds listed in Standard's Bond Investments, which contains a pretty comprehensive list of bonds. My exhibit is based upon Standard's list. The bonds that actually go into the averages here are a reduced number of bonds because of the eliminations made from the list for statistical reasons.

You ask what justification there is for eliminating any bond for statistical reasons. Bonds selling above call price should be eliminated, because the yield to maturity on such a bond is not a wholly representative indication of the rates on such a lien. Special features, such as conversion features, possibly influence market price of a bond.

You ask if it is also necessary to exercise some degree of selection, either to select those to be used or those to be thrown out, in dealing with statistics. I think you have to set up your specifications in a thing like this, yes. You ask if that is what I meant when I said "they attempt to get figures that are representative yields and are not distorted by some particular momentary situation." That is something else. I think it is referring generally to their processes of selection. There are reasons why they do certain things.

I used the explanation A-1 plus, A-1, A, B-1 plus, B-1, B, in my section dealing with public utility bonds. These ratings correspond generally to Moody's Aaa, Aa, A, Baa, Ba, B, in the same order.

You ask what significant fact do I get from reading across the first six columns of figures to the right of the year 1925, under the captions A-1 plus, and so on. I think it shows that as the quality falls the yield rises. I think the most important factor entering into this is the differences in the investor's opinion as to the amount of risk in the various grades of securities. If the degree of risk is higher, then as of that time it is the ordinary thing for the investor to ask for greater compensation. These yields are based upon market prices, or sometimes they may use bid prices or other prices that do not actually reflect actual sales, but the general idea is yield to investors here.

The average yield for the year as shown here for the year 1925 on B bonds was 7.92 per cent. The corresponding figure for the A-1 plus bonds was 4.92 per cent, an absolute difference of 3.00, or 61 per cent of the yield on the A-1 plus bonds. In 1938 the yield on the A-1 plus bonds was 2.88, the yield on B bonds was 7.93, an absolute difference of 5.05. Stating that in terms of percentage of the yield on the A-1 plus bonds the result is 175 per cent. The spread between the yields on the two ratings of bonds increased quite a bit as between those two years.

You ask whether that indicates a higher premium for safety or corresponding additional demand for risk compensation. I think two things are involved here. One thing is that there may be some increase in the investor's request as to the amount of compensation he wants
1687 for a given risk. It may mean also, and I think this
is probably very important, that those who have the great bulk of the investment funds are restricted by the nature of their operations or the laws under which they operate or the principles under which they operate to

investments of the highest grade. That has tended to drive the low yield down.

I think that during the cross-examination at Washington at the last session there were some extracts from the New York insurance law read into the record. Some laws of New York with regard to investments of mutual savings banks and the like. That is an illustration of what I mean that some investors are restricted by the laws under which they operate. I believe that there are some statutory requirements there set up which are predicated upon the idea that bonds that can meet this test will be high grade. That does not always follow; but that is the motivating force. I was just reading this morning in one of the insurance company's pamphlets we have around here where the insurance company was setting forth how they were restricted to higher grade securities. No, that is not a new law.

In view of the absence of additional high grade financing, most of it being refunding rather than new issues—there has been keener competition among those investors for those high grade securities. That has been one of the factors which has influenced the yield drop on them.

I would not accept as a generalization your statement that there is a pronounced disposition on the part of those who have no legal restrictions, and who can do as they please with their money, to seek safety of investment rather than compensation for risk. Some people are investing today in very risky securities, just as they always did. Some people are seeking safety, some of them are taking chances, and so on. I think it is generally true that at any time in the market you will find people investing for different reasons and for different purposes. You ask if we will find the same percentage of people who are investing money in 1938 and 1939 who are willing to go out and put their money at risk for the compensation promised at this time as was true in 1925. I think probably today the percentage of speculative money is somewhat less than then, because a lot of speculative money has been lost.

It is true, there is a lot of money in the banks which belongs to private individuals. It is largely staying in the banks. You ask if the yields are about the same in 1938 as they were in 1925 on B bonds and B-1 bonds. The B average of public utilities bonds for the year 1938 was 7.93, which was only one-hundredths of one per cent higher than in 1925. The B-1 was 6.98 as compared with 6.74, a difference of twenty-four one-hundredths of a point. The overall yields on those two classes of bonds were slightly higher in 1938 than in 1925. I don't know what the risk premium is in there. The yield on the high grade bonds is lower in 1938 than in 1925. The yield on the high grades is, of course, materially lower than it was in 1925. I can't separate that figure between the so-called pure interest and between the risk premium and between all the other factors which Dr. Dorau gave as being elements in the total figure. I can't split it up. Whether anyone has changed over the period in relation to the other is a debatable point.

You ask what course the yield since January, 1939 has taken with reference to A-1 plus bonds. The yields on the A-1 plus public utilities as shown here on page 8 of the exhibit, beginning in January, 1939, have a slightly downward trend. That continues into July of 1939; so the trend would be downward to July. It was up very slightly in August, up quite a little bit more in September, and probably down a little bit in October. I don't have the figures.

1688 In September, 1939 the yield on the B bonds was 6.61; the yield on the A-1 plus, 3.17, an absolute difference of 3.44. And the difference, stated in terms of percentage, as we expressed it in the other instances, is 108 per cent of the spread as of January, 1939.

You ask if there is the same tendency to demand higher yields as I go from A-1 plus through the other grades to B bonds in the railroad classification. That seems to be true, in the early years; and also in these later years. I think that there is a step-up by grades of bonds in the yield both in the utility and in the railroad bonds. I don't want to give too much validity or weight to these ratings as such that these investment services put on the bonds. By and large they are fairly indicative of quality; but there are notable exceptions, of course. You state that you are asking about what this exhibit shows. Yes, insofar as the yields on various qualities of railroad bonds are concerned, as the quality goes down the yield goes up.

Comparing the yield between A-1 plus and B bonds in 1925, the absolute difference is 2.73. That is 57 per cent of the yield on A-1 plus bonds. In 1938 the spread between the yields on A-1 plus and B-1 railroad bonds was 4.99, or 140 per cent of the yield on A-1 plus railroad bonds. Going back to 1925, it turns out that the spread between the yields on A-1 plus and B-1 bonds was 48 per cent. Comparing the yields on railroad bonds of the B-1 rating and of the A-1 plus rating, for the period indicated on the sheet as October, I find an absolute difference in the yields of 3.75. That is a percentage of 103.

Passing to the industrial bonds, I find the absolute difference between the yields on A-1 plus and B-1 industrial bonds in 1925 to be 2.56, and in 1938 to be 2.86. The percentages are 51 and 91 respectively. In September, 1939, the absolute difference is 2.15. The percentage is 70. (Objection by Counsel for Illinois Commerce Commission overruled.)

Exhibit 183, Table 1, deals with a number of banks and amount of bank deposits in the United States. It appears that there are about half as many banks in 1939 as there were in 1923. You ask if I think that is a matter of importance in a study of this kind. I do not think it is of great importance. I think there are certain conclusions that might be drawn from it. It might be used in some ways in connection with the interpretation of a trend of the volume of deposits. It might be used in some ways in connection with the availability of credit in various areas. I mean, the fact a great many banks have closed up out in certain sections of the country may make it more difficult for the people in that section to obtain credit and other banking facilities, and so on. I mean it is sort of localized.

You point out that the table shows that the bank deposits have increased from 42 billion dollars to 55 billion dollars and ask if that doesn't show that we have banks enough to take care of these increased deposits. Those are the deposits of those banks and the deposits in any closed banks are not reflected in those figures.

On June 30, 1939 the volume of deposits in banks now doing business was $55,988,000,000. It is an increase over some of the earlier figures. I don't know that it is the absolute peak. 1928 appears to be the absolute peak; but when compared with 1923, the first year shown on the
1689 chart, there is a substantial increase of about $13,000,000,000. That is a great deal of money even in these days.

Yes, I said at page 7822 of the record that the outstanding factor influence has been the large volume of idle funds that has accumulated in recent years. I still stand by that statement. I said that these idle funds are reflected in the banking system in two forms; namely, deposits in banks and excess reserves of the banks themselves. The one doesn't precisely include the other as you indicate.

The deposits in the commercial banks represent funds of depositors. The funds of which the excess reserves are made up, those are bank deposits in the Federal Reserve banks and the sources of the funds may be somewhat the same, or to a large extent the same, but they are different items definitely. It may be that the reserves which the member banks deposit with the Federal Reserve banks are often the same funds that are on deposit with them so they won't keep so much cash on hand. They may keep some of their own funds. You can't tell. These deposits with the Federal Reserve are cash deposits. The deposits in the banks themselves, a great deal of them, are merely credit money, you might say.

You ask if it isn't true that we can't take the two and add them together and get the sum total of idle funds without analyzing to see how much of the reserve of the member banks are included in the Federal bank reserve. I wouldn't attempt to add them together because they operate in different ways.

You ask my theory as to why these idle funds have accumulated in the banks and why these deposits are so much higher than they were a few years ago, notwithstanding the sentiment that seems to be somewhat abroad that we have had hard times and have them now as compared with former years. As I stated on direct the principal factor contributing to the increase in the member bank reserves has been an increase in our monetary gold stocks, because those reserves are after all hard cash. One of the big factors in the increase in deposits has been the deficit financing by the United States government which has resulted in credit expansion and that has involved the creation of deposits.

You ask if the idle funds of the depositors which are lying in the banks are there in my judgment for that reason. They are there because whoever has the title to them feels for the time being that is where he prefers to keep them. That is the form in which he prefers to keep that money rather than in some other form, subject, of course, to the limitation of opportunities of using them in the ways he thinks are compensatory to him.

You ask if I am in agreement with the suggestion that he is not willing to put his money into the industrial activities for the reward that is promised him at the present time and under present conditions. That may be part of it. I mean some people who have these idle deposits prefer to have them idle rather than underwrite the risks they would have to underwrite in order to get the rate or get the expectation of the rate they might want. Another factor is the absence of feasible opportunities. I mean, you have to draw a distinction between what is a risk and what is just plain fool-hardy. Risk is essentially uncertainty and if a project is definitely on its face not economically feasible then it isn't a matter of risk, there is no uncertainty there. On the contrary, you are pretty certain the thing is doomed to failure. There is that distinction.

1690 You ask whether it isn't a fact that in order to attract capital to risk investments it is necessary to offer what the investor conceives of as proper compensation for the risk involved. (Objection by counsel for Illinois Commerce Commission overruled.) I certainly think in order to get an investor to buy something he has to be satisfied with the terms. You can't force it down his throat. It is not mandatory that the investor buy things. It is still a free country, as far as I know.

You asked me this question, "If at present the situation is that we have large volumes of money which are lying idle, as you have stated, and if one of the reasons why that is true is that those who have money to invest at this time are not willing to put it to risk for the compensation that is promised under the present conditions, in order to get that money into investment, will it not be necessary to offer more than the present level of returns on investments if the idle funds are to be put to work." (Objection by counsel for Illinois Commerce Commission overruled.)

I think about the best answer I could give to that is to break it down somewhat. I am answering also in the light of the two "if" clauses in the question, and that is this: We assume also that part of the idle funds represent funds of people who by preference will invest in, say, government securities, but if they also have a preference for a rate of interest higher than that currently available on government securities, they would not invest. That is, I think, the general idea of the question, and to that extent I would probably agree to breaking it down in that fashion.

If investors have these two preferences of types of investment and also rate of interest and they cannot get the two together, they are more apt to just pass it up altogether, or something like that. I think that is a distinct possibility, considering individual investors.

You ask whether or not I have said earlier in my cross-examination, and also in my direct, that the tendency of these figures which I have brought in here in my several exhibits indicates that there is a disposition to seek safety as opposed to risk. I do not think I stated it quite as broadly as that. I think that may be just one factor. I think equally important, and perhaps more important, is simply the lack of available investments.

I mean available investments that offer reasonable possibilities at all. I think the banks would be glad to extend and expand their commercial loans if the proper kind of opportunities were available; if the demands of consumers, and so on, for goods and services could be increased such that they would make this additional business feasible at all, and, therefore, create a demand for commercial loans, the banks would probably be glad to make those loans. They have the funds available to do that.

You ask if the banks would be favorable to making the loan if there was greater compensation for the risk involved in the loan. I just do not go along fully with that, because I think in any time, even in the so-called good days in the nineteen twenties, there were probably a great many demands for loans turned down because the bankers decided the project for which the loan was to be used was not feasible at all; and that same situation would exist today, as far as that goes. That is what I tried to point out a while ago, the difference between risk on the one hand, and the outright unfeasible venture on the other. I think I have stated in substance that one of the things that is
responsible for the accumulation of idle funds in the
1691 banks is the circumstance that the owners of those
funds or the banks which control them are not willing
to put them into risk at the compensation at present offered. I said also here again today that some of the investors are not willing to accept the rates that are currently available on the types of securities in which they ordinarily invest. They prefer to leave the funds idle. That is one of the factors.

You ask how we are going to get those idle funds into investments unless we increase the compensation for the risk involved. I think the answer is still the same that I gave a while ago, that first you have got to bring about a revival of demand for investments. I mean, the two things, the demand on the one hand and the supply on the other, must be considered together. If you take commercial loans, again, if there were substantial increase in the demand for commercial loans, and if those loans were of the character in which banks invest, you could still have quite an expansion there without a material change in rates charged on those because of the existing level of rates, but if the demand were great enough eventually you might get the rates to go up again.

By demands for investments, I mean the request by people who are engaging in business for funds with which to expand their activities.

You ask what is going to induce them to request that money and to want it. The opportunity to employ the capital profitably. I cannot connect that up with your suggestion that they must have an opportunity under circumstances that will yield them more than they are offered under the present conditions. We are talking about the entrepreneur and that is the man who is borrowing the money. Now we are going back to the man who is lending him the money. There is plenty of occasion to use capital in this country at a price probably. I know that the government is building projects of one kind or another all over the country. A lot of those are justified on a social ground rather than economic ground, however. Yes, school houses and other improvements are being built all over the country that involve the issuance of securities. And the government is putting up the money in a great many of those instances. I don't know the proportion. (Objection by counsel for Illinois Commerce Commission overruled.)

You have asked me to look at Moody's Public Utilities Manual of 1939, to the second portion, of what might be termed the blue section, under the caption, "A Nation-Wide Survey of Public Utility Progress". I find here in this volume of Moody's a map or chart that has the title, "Location of Federal and District Power Projects in Relation to Utility Holding Company Systems." It indicates by symbols throughout various sections of the United States, the map of which is shown here, the location of various federal and state and district power projects. There are quite a few of them. Beginning on page A-33, there is a list here that carries the caption, "Government Sponsored Power Projects," that begins about a third of the way down the page and apparently continues for approximately two pages, including foot notes and also including some PWA allotments for electric power projects in various municipalities, apparently, and information of that character. (Objection by counsel for the two commissions overruled.)

You ask why private capital is not doing that. I think probably there are a number of reasons why government money is being used. I do not profess to know all of them. One that I feel is possibly rather important is that some of these projects involve overall things that private
1692 industry, under our present system, could not economically participate in. They could not pay out on them. I mean, wherever gains are of a social nature, or wherever a project consists of several things,—power, flood control, rehabilitation, and so on,—where in order to make the project as a whole feasible it has to cover these various things, some of which private industry could not go into as we do business today, then you get something that is a function of government, as I see it. Now, that is one of the contributing factors as to why these things are being done, probably.

Another reason is that the people involved in some of these projects might not be able to get the funds at a rate that would permit them to undertake the venture. That is the other side of the picture. But there are two things involved there, at least two; probably there are many more if we were to make an exhaustive study of it.

If we turn the second reason over and eliminate those projects that are purely of a governmental nature and get down to these that are being financed by the government because private industry cannot get the funds with which to do that same work, they might not be able to get the funds at all. I do not think I said that they cannot get the funds at the present level of returns. Some of these little bit of towns might not be able to get money at all from private sources, if you want to carry it to that extreme.

You ask if one of the reasons that is given for the large amount of money which the government has found necessary to expend in projects of this character is not that private capital is unwilling to do it. (Objection by counsel for the two commissions overruled.) Well, the term "unwilling" of course, is something we might argue about; but assuming by that that they are unwilling to do so because they do not see that the return would be compensatory, I can also point out that is the very nature of the situation, for reasons I stated a moment ago in connection with projects involving more than what we might say business is interested in, or of a nature that private capital is not interested in. I note on page A-34 that one of the allotments is to the City of Springfield for an addition to its municipal electric system there. I don't know whether you would be apt to get private capital to go into a municipal system, which is competing with private systems. So there are various reasons why private capital is unwilling to do some of these things. No, it is not an unusual thing for a municipality to issue bonds and sell them to private capital. I think the City of Springfield does have municipal bonds. Whether they are on the power plant or not, I do not know.

Springfield might be further illustrative of the first point I was talking about, in that they completed a few years ago a big municipal project down there, including a lake, a resort place, and parks, and so on, and connected with it was the power plant. Whether or not private capital would enter upon that sort of enterprise is doubtful. Oh, yes, many bonds issued by cities, even for the purpose of acquiring or building extensions to municipal utility plants, have been floated in private circles. Sometimes they are purely revenue bonds. Somtimes they are guaranteed by the whole faith and credit of the municipality, and its taxing power. Yes, they are still being floated.

You point out that at page 7776 I stated I had devoted
many years to the study of accounting, statistics and
1693 mathematics, finance, money and banking, economics,
public utilities, and similar fields. Then you ask my opinion as to whether or not it will be necessary to offer more inducement in the form of compensation for risks to that part of private capital that is not now invested because it is not willing to take the risk for the compensation offered, in order to get that capital into industry. (Objection by counsel for Illinois Commerce Commission overruled.)

I again have to answer as I have been answering. It is not merely a question of risk. It is partly being able to show the investors that there is actually an opportunity here for employing money. The project has to be feasible, in the first place. Then you appraise the risk after that. I mean by that an opportunity to employ capital in enterprise and make money on it. Of course, we can always put capital to use in an unsound venture; but we have to show that conditions require that additional capital be embarked upon some enterprise for some purpose, and that it is going to be something that the public is going to pay the bill for; that there is a demand for it. I think there is a distinction there between those two things.

Yes, some capital has ventured into risks during these depression years.

You asked why money that is lying idle in the form of idle deposits and the excess reserves of the member banks with the Federal Reserve banks isn't out at interest. A very important reason, I think, is the lack of opportunities for the kind of investments that banks can make; the investments that are attractive to banks; and I think that lack of opportunity has resulted in the decrease in interest rates on bank loans.

You ask if I think it is the lack of opportunity rather than the lack of desire to get into industrial enterprise. That goes back to the other part of the question. Lack of opportunity must be thought of in terms of feasible opportunity. I think I have explained that they must be attractive enough to induce capital to come in.

You ask whether I think the figures shown in Tables 2 and 3 in Exhibit 183 are indicative of the financial or economic condition from year to year during the years 1923 to 1939. They have some significance in connection with the interpretation of the other pages in the exhibit; very broadly speaking. You can't accept these figures as being an exact measure of the turnover. It is intended to show the trend. Statistically it is a pretty difficult thing to handle, so I would not want to bind anybody down too closely on this thing. I am only trying to give some quantitative measure in connection with this matter of the turnover of bank deposits. This, being a ratio, it would be influenced by two factors. It would be influenced by the amount of deposits, and by the amount of bank debits.

In 1939 the deposits were $38,000,000,000, and in 1928 $35,000,000,000. In 1935, I see $32,000,000,000. In Table 3 it appears that the turnover in 1928 was approximately at twice the rate as in 1939. You ask in which year was the effective capital the greater, in 1928 or 1939. I don't think

I know what you mean by effective capital. I don't think you can measure the effectiveness of capital by the turnover. The turnover is not intended to measure that. It is intended to measure the idleness rather than the effectiveness. I don't know what you mean by effectiveness.

1694 You ask if there is any difference in a million dollars which is turned over 43 times and a million dollars which is turned over 22 times. It has some bearing upon the ability of the banks to make loans. It has some bearing upon the liquidity, and so forth.

I am trying to present these figures on pages 2 and 3 as an indication, first, of the idleness of funds; and second, to indicate that the volume of funds could be probably turned over more rapidly than they are now being turned over; and that they would naturally support a greater volume of economic activity than they do now.

(December 4, 1939.)

I prepared Exhibit 181.

I have here information concerning the financing of nine of what I call natural gas systems. You ask if any of them are engaged in natural gas operations. Some of the top companies are holding companies that probably have no direct operations themselves. You ask how I went about selecting these particular nine companies. I took everything I could, everything that I thought was financing by natural gas systems, with the exception possibly of a few small instances, and with one exception wherein I was not able to get at the time information that satisfied me as to the nature of the financing. I don't mean that this list includes all of the natural gas systems operating in this country.

By "everything" I mean all the new financing in this line that came to my attention in the various sources I consulted.

By the expression "in this line", I mean in the natural gas industry generally. There may be facts to which I do not have access.

The period of time covered by this exhibit is beginning with the year 1936 and continuing down to as late as I could get information at the time I was preparing this exhibit. I can't be too dogmatic about it because some may have escaped my attention. I know financing goes on about which the public does not have information.

By natural gas system, I merely mean companies or a system of companies, thinking now of holding companies and subsidiaries, which are concerned with natural gas operations to an extent that they would appeal to me as being natural gas systems.

You ask whether I don't regard Natural Gas Pipeline Company of America and Texoma as constituting a system, in the sense that I have used that term. I don't know offhand where I would draw the line as to the top companies in the picture. It is my understanding that defendants do not distribute gas in their own names, certainly.

By the expression "in their own names", I mean, some gas might be taken directly off of the pipeline, and might physically be delivered to a consumer, but they perhaps don't do it in their own name. I don't know that that is the fact. I know enough about it to say that it is conceivable. I don't say that it is true. I said it is conceivable, and I am thinking of the interruptible gas sales here in the Chicago area. I am not sure just what the physical facilities are by which these deliveries are made, who owns those actually.

1695 Yes, I know the facilities of defendants terminate at Joliet. I was possibly thinking more of the Chicago District Pipeline Company than I was this; except also I believe there is some industrial business down near Streator, around in there, which is—I don't know. I believe that a reasonable person reading the record ought to be able to come to a conclusion as to what is being said.

Questions Interposed by the Examiner.

My contention had to do with the actual basis of my selection in answer to Mr. Morgan's question as to how I went about selecting the companies I discussed in Exhibit 181.

I do not have any facts in mind as a basis of my statement that defendants were not distributing natural gas in their own names. I was merely attempting to explain my thought processes. Perhaps I went too far in that regard. I think that there are situations in Illinois where deliveries are made direct from the pipeline to a customer, or substantially in that fashion, and billings are made by the distributing company. It is a very fine point.

Cross-Examination by Mr. Morgan (Resumed).

You ask if that was in connection with defendants' system. That is in the state of Illinois. The basis for my thought that such a thing was conceivable is based upon what has happened, or what I recall as having happened, or is still happening in Illinois. In selecting the nine companies shown in my exhibit, I did not have in mind the thought that defendants might be distributing gas in somebody else's name.

You ask whether or not I stated near the bottom of page 7798 of the record that this exhibit represents my interpretation of the facts and figures which I gathered from sources named in my testimony. I gave here at page 7798 the number of various sources from which I took the information. I might have copied some things verbatim, or some facts verbatim, and I might have paraphrased in other cases.

You ask if these prospectuses I have mentioned here are the documents to which reference has been made in the testimony here and which have been filed with the Securities and Exchange Commission. There is one document that was filed with the Securities and Exchange Commission in connection with the flotation of securities.

You ask how I got hold of them. I asked the bankers for them. You ask whether or not they are circulated among the public after they are finally approved by the S. E. C. I don't know anything about this approval business that has been argued here. I get these prospectuses in this fashion: New issues of securities are mentioned in various ways; newspaper advertisements, newspaper stories; they are listed in the Commercial and Financial Chronicle; they are mentioned in S. E. C. releases. When I see anything on which I wish to have the prospectus, I direct the librarian of the Illinois Commerce Commission to go to or to write to one of the underwriters and obtain a prospectus. I have a pretty large file of them over there; I think all public utility prospectuses, or certainly most of them during the last few years. To digest them in detail is an impossible job for one person. I consult parts of them frequently. Usually; I have no difficulty in getting them when I ask for them. Once in a while there is some difficulty. I don't know how many copies are printed. I don't know what they

do in the way of circulating them. I have said that I
1696 have been able to get most of them. That is the reason I consult these prospectuses. I don't go over to the S. E. C. and get certified copies of them before I use them. I could not consult them if I did not have them, of course. I also used Moody's Manual. I am not sure I used Poor's. I know I have stated that I used it. We don't keep Poor's in our Chicago office; we do have it in the Springfield office. The extent, if any, to which I consulted Poor's, would be very limited. Once in a while, when I want to look at Poor's, I will go down to the Chicago office of the Poor Publishing Company to consult it.

Moody attempts to give quite a bit about some companies, and they give very little about others, because many companies probably won't supply much of the information that they want to have. I am not always able to ascertain from Moody's the relation of earnings to interest on a particular issue of bonds. In some cases we can, and in some cases we can't. It depends on the particular issue; it depends on how you define interest. If you mean nominal interest, you may get a better idea than you would on interest that includes amortization, and so on. I don't know whether others frequently consult these two manuals for those purposes or not. I consult them for whatever purpose I want to consult them for.

If I was interested in the relation of the earnings to the interest on a particular issue of bonds, I might consult Moody's to try and find out. If I thought I found out from that source, I would use it.

I was discussing open-end mortgage provisions in my testimony here. (Objection by Counsel for the Illinois Commerce Commission overruled.) I will try to explain what I mean by that. I don't want to be held to having made too technical or too legalistic definitions. I am trying to give a practical conception of what I mean by an open-end mortgage. And that might be subject to many additional qualifications and additional statements in case I were pressed as to why I didn't say this or didn't say that about it. Now, many of the mortgage securities presently outstanding are issued under mortgages that contain provisions whereby under the conditions set forth in the mortgage more securities of the same general character can be issued. It would permit the issuance of additional securities under the same mortgage, under the terms contained in the mortgage with respect to the additional issue. I mean "conditions set forth in the mortgages" that the issuing company is not free to go out and choose the uses to which it would put the money raised through bonds issued in pursuance to those open-end provisions. (Objections by Counsel for the two Commissions overruled.) I don't know all the different conditions and terms they put in mortgages. They vary from mortgage to mortgage.

You ask if that restricted the uses to which the company might put the money if they want to raise the money through that mortgage. (Objection by Counsel for Illinois Commerce Commission overruled.) Those provisions are there for whatever purposes the language there indicates is involved, I suppose.

You ask whether there is a restriction on the company's use of money that can be raised through bonds that are issued under that open-end mortgage. (Objection by Counsel for Illinois Commerce Commission overruled.) I can only answer by saying that a mortgage indenture sets forth the rights and duties of the parties involved in the contract, whatever you want to call it. Yes, I think that is an answer to your question.

You again ask whether or not this expression "subject to the provisions contained in the Mortgage", to which I referred to a while ago, is a restriction that is put in the mortgage upon the use to which money raised through the issuance of bonds coming under that mortgage can be put.

1697 (Objections by counsel for the two Commissions overruled.) As I conceive it, the mortgage indenture under which a security is issued is a document containing the rights and duties of the various parties to the contract. There are conditions. I am just refraining from characterizing the conditions, because I cannot do that. If bonds are issued under an existing mortgage they must be issued, unless there is some new agreement, according to the terms and provisions of the existing mortgage. Of course there are supplemental indentures from time to time.

You ask if I read the prospectuses of some of these companies. I did not read any of them from cover to cover, certainly. The principal thing I got from them was the amount of proceeds derived from the issue and the sinking fund provisions; that was the principal thing. As to the order in which I consulted various sources, I cannot say.

The order in which I listed them here is just the order in which I happened to think of them.

I think I said on direct testimony that I also sometimes consulted the bankers directly in an attempt to get additional information from registration statements.

You have exhibited a document to me. It looks familiar, yes, sir. I will compare this with my copy. I think your copy is the same as the one I have. It is a copy of the prospectus of the Arkansas Louisiana Gas Company.

You ask me to read Paragraph numbered 1, the "1" being in parantheses, on page 14 of that prospectus. It reads as follows:

"The aggregate principal amount of such additional bonds which may be so authenticated and delivered (other than bonds authenticated under the deposit of moneys as hereinafter set forth) and the aggregate amount of such deposited moneys which may be withdrawn shall not exceed an amount equal to the sum of $2,500,000 plus 66⅔ percent of the amount, if any, by which the cost or fair value, whichever in any instance is left, of property additions (consisting of additions to, or renewals and replacements of, properties useful in the transportation, distribution or sale of natural gas or in the manufacture, transportation, distribution or sale of manufactured gas, or additional properties useful for the foregoing purposes, but not including oil, gas or mineral leases or rights of royalties or oil or gas wells), subject to the lien of the Indenture, exceeds retirements of such property (as the term retirements is defined in the Indenture), for the period subsequent to July 1, 1936." (Motions to strike and objections to the whole line of testimony by counsel for the two commissioners denied and overruled.)

1698 I believe I have here a prospectus of Panhandle Eastern Pipeline Company. I have two of its prospectuses in my file, one of which seems to correspond to the document you have handed me. That is the prospectus relating to the issuance of $24,000,000 of the company's First Mortgage and First Lien Bonds, Series A, four per cent, due March 1, 1952, such prospectus carrying on its face a date of March 30, 1937. (Objection by Commission counsel overruled.) On page 15 of this prospectus, the paragraph before the last reads as follows:

"The term 'fixed property additions' will not include, among other things, (1) the first $4,000,000 in cost to the

Company and/or one or more qualified subsidiaries of fixed property additions purchased, constructed or otherwise acquired by the company or a qualified subsidiary subsequent to March 1, 1937, or (2) any gas production property, viz.: gas acreage, gas wells, gas or gas and oil leaseholds, and other works and properties used in or useful for the production of natural gas."

(At this point the Examiner directed the reporter to incorporate in the record from page 12 of the prospectus of Panhandle Eastern Pipeline Company the first paragraph under the title "Issuance of additional bonds" and the first sentence in the sub-paragraph below: "The Mortgage and Deed of Trust to be dated March 1, 1937, between City Bank Farmers Trust Company and James M. Kemper, Trustees (hereinafter in this prospectus referred to respectively as the 'Corporate Trustee' and the 'Individual Trustee'), securing the First Mortgage and First Lien Bonds Series A, will limit the issuance of Bonds thereunder to $35,000,000 principal amount of bonds, except as stated in Paragraph (III) on page 13 hereof. It will provide that First Mortgage and First Lien Bonds Series A, in the aggregate principal amount of Twenty-four Million Dollars ($24,000,000) shall be issued thereunder forthwith on the execution and delivery of the Mortgage and Deed of Trust. The balance of the Bonds issuable under the Mortgage and Deed of Trust, viz. $11,000,000 principal amount, may be issued thereunder from time to time in series (other than Series A) when and as determined by the Board of Directors of the Company, but only on the following terms and conditions:

(1) Additional bonds may be issued only in an aggregate principal amount not exceeding sixty per cent of the cost of fair value (whichever is less) of any unbonded fixed property additions of the Company or a qualified subsidiary.") (Objection by counsel for the two Commissions overruled.)

Returning to page 1 of Exhibit 181, I start with the Arkansas-Louisiana Gas Company. That company is engaged in producing, purchasing, transmitting, selling and distributing natural gas. I don't know whether these constitute all the phases of the natural gas business. You ask if that is a broader field than these two companies under consideration cover. As far as I know, the two companies under consideration have some production. They also purchase some of their gas. They also transmit part of the gas. The question of distribution has been argued already. Yes, the major portion of the Arkansas-Louisiana Gas Company's revenue is obtained from direct distribution of natural gas to residential, commercial, industrial, and other customers in a few more than one hundred communities in the three states of Arkansas, Louisiana, and Texas. They also conduct some wholesale operations.

You ask if in that particular they resemble defendants.

I think both companies do some wholesale business.
1699 They both own production and both companies transmit gas. I don't know what other points of comparison might be involved. (Objection by counsel for Illinois Commerce Commission overruled.) You ask if the Arkansas-Louisiana Gas Company is not a network. They serve more than 100 communities in three states. They presumably have pipes running from place to place. It might be characterized as a network. I would have to check that geography before I can agree with you that they are located in northwestern Louisiana, southwestern Arkansas and northeastern Texas.

I don't know how many gas fields they produce from unless I have stated it here in this exhibit. I don't know anything more about the gas fields, that I can recall right now, than what I have stated here in the last sentence of the first paragraph of page 1, of Exhibit 181, in which I say the natural gas supply is obtained principally from fields located in Louisiana and Texas. I do not show the names of the fields from which the gas is obtained. I think the source of supply and the extent of the supply would be taken into consideration by the bankers who are floating the issue certainly, and presumably they would consider it in arriving at their terms. I mean the price which they paid, the terms at which they buy and at which they attempt to sell it.

You ask whether I was able to get those facts from the prospectus and why I did not include the information. I think one has to exercise some judgment. I stated on direct the purpose of these short summaries was not to make an exhaustive analysis but to bring some amount of orientation as to where the companies operate and what their operations are like. I could have copied the whole prospectus and so on but that is not very reasonable it seems to me.

You ask whether or not, in the light of my statement that a banker would probably be interested in the source of supply and the extent of the supply in determining the terms under which he would be willing to buy the bonds and the price he would pay for them and for which he would offer to sell them, I would be handicapped in appraising the figures shown in the exhibit unless I have such information included along with the figures. You want to take in an awful lot of territory. I don't see how I can answer that question very well.

I have brought here figures showing the prices that were paid, the rate of interest that was charged, and other figures concerning several financial transactions of the Arkansas-Louisiana Gas Company. I have said the bankers would look into the source of supply and the extent of the supply of natural gas behind that natural gas system. They certainly would consider it. Beyond that, going to the weight or anything else, I can't tell you how their mind would work on that in relation to that. You ask if they were not considering that or giving those facts any weight, why did they take up their time with it. My thought as to that, whether they observe any weight, they don't know what it is in the first place and can't tell whether they are going to give any weight to it. Yes, I stated a while ago, it would probably have something to do with the amount they would be willing to pay for the issue under consideration.

You ask that if I bring in the figures without bringing in this one element that must be considered in arriving at what they are willing to pay does not render the picture incomplete. (Objection by Counsel for the Illinois Commerce Commission overruled.) That exhibit certainly is not complete as regards its containing all the information that is available with respect to these companies and the nature of their operations. You ask what else the banker would concern himself with besides the source of supply and the extent of the supply in connection with extending credit. That is a fairly long list. He would consider the whole picture of the company's operations, its contracts, its markets,
1700 the length of the pipeline from the source to the market. He would look at the adequacy and the reliability of the source of supply. In order to look at this information, he would have to look at the supply as it exists. (Objection by counsel for Illinois Commerce Commission overruled.) I think I said he would look at the company's whole operations. I am doing the best I can.

Cross-Examination by Mr. Slaff.

You ask if the bankers would not look at the indenture. They would probably have a great deal to do about the drawing up of the indenture. You ask if they would consider who the officers and the directors were before extending credit. Sometimes credits are extended upon the basis of personality as well as other things, if that is what you mean. I stated on direct that they would consider a vast wealth of material which I did not attempt or purport to set out in my Exhibit 181.

Cross-Examination by Mr. Morgan Resumed.

You ask if it is not necessary to have more than I have in this exhibit in order to properly appraise the figures which I have brought in here as indicating the cost of money. I don't know how far it is necessary to go with respect to this matter of forming judgments. Certainly, the ultimate facts are what they are. If you are going to make an exhaustive analysis why there was a slight differential between this and that you would never get through with your research in order to form a judgment. I have stated that there is a great deal in these prospectuses besides that which I have carried into this exhibit. You ask if the information carried in the prospectuses is of a character which must have taken a lot of time and involved a lot of expense to prepare. I have heard complaints to that effect.

You ask if it is not reasonable to say that that information was prepared and the time and money was utilized in preparing it because the investors who were considering the extension of the credit would require that information. I think it was prepared because the law and/or rules or regulations under which the SEC operates lay down those requirements. You ask whether the investment bankers would require that information. There were not any prospectuses like this before the SEC Act of 1933. The issuing companies did not give anything like that much information to the investor prior to that time. (Objection by Counsel for Illinois Commerce Commission overruled.) I said the investment bankers prior to the SEC did not hand out to the investors anything like the amount of information that is presently contained in the prospectuses.

At a matter of fact, I doubt if the investment bankers exercised the same diligence to inquire into the facts that they do now. (Objection by Commission Counsel overruled.) I don't know the facts. I am trying to give you the best sort of answer. I have a basis for an opinion. It is substantially true that at this time information as to the character of operations, as to whether the operations are integrated, as to the number of customers served directly, the source and extent of the supply, the distance of the field from the markets, the indicated life of the field, and a great many thing of that character is required by the investment bankers in connection with security issues at this time. The investment banker requires everything he thinks is pertinent in regard to the operations of the company. I could go over each one of these one by one, and perhaps on most of them I would agree that the bankers would check them up.

I have given the scope of my information as to the Arkansas-Louisiana Gas Company. I would not go so far as to say I did not read any other part of the prospectuses; I certainly have not taken the time to go over them in detail.

You ask how the figures which I brought in here
1701 can be used in appraising the elements which enter
into a proper rate of return for these two pipeline companies in the absence of the additional information. I assume what I am being asked concerns the thought processes of people in forming judgment; I think people must be assumed to be reasonable; and I assume, in forming a judgment, the whole history of our economic picture is one in which we have acted upon such knowledge as we have. And the thought I am trying to get at is this: The degree to which one goes in running down all the clues and bits of evidence in connection with a thing like this is a matter of judgment. I don't know how to go any further on it, because, after all, we talk about securities, and people have opinions about securities; but many of them have no idea of all of the details of operation of the companies whose securities they are talking about.

Redirect Examination by Mr. Booth.

You ask if I am showing the facts as to the bond yields of these various companies listed in the exhibit. I was trying to present a story here of what these companies have done and as I have said, for purposes of orientation, I have brought in a little bit of description about the company. If I did not put that in I would have been asked why I did not.

Cross-Examination by Mr. Morgan Resumed.

I don't know to what extent the banker might have gone in comparing one company against another in forming their judgment on a given company.

You ask if the figures concerning the Arkansas-Louisiana Gas Company's financial operations are to be of service in this inquiry, it is going to be necessary to see whether those elements which were considered by the bankers in connection with that company obtain with reference to the two pipelines under consideration. I think I have answered a number of times, but I will try once more. It seems to me that the position is that these figures can't be even looked at unless it is shown that every thing, all the minute details with respect to the operations; that a comparison is made, checking one off against the other, to arrive at an opinion as to each little difference, and so on and so forth. If that is the criterion upon which this sort of material must be prepared, none of it could ever be prepared as a practical matter. Look at Dr. Dorau's exhibit. If that sort of analysis were even attempted there it would be an impossible job. We have got to be reasonable in these matters. That is all I mean to say.

You ask if the fact that the Arkansas-Louisiana Gas Company got money at the figures and on the terms shown in my exhibit 181 means that the defendants could get money on those terms. That doesn't follow as a matter of cause and effect.

Redirect Examination by Mr. Booth.

Yes, they might get it for less.

Cross-Examination by Mr. Morgan Resumed.

Certainly, in order to arrive at the cost to these two pipeline companies of raising their present capital by overall financing transactions, it would be necessary for these companies to present to their investment bankers or to others through whom they hope to obtain the funds, a full and complete statement of the nature and character of their operations. I think their judgment as to the market price that might be obtained for that type of security would have some bearing or would be influenced in part by what they know about the market price of other issues.

1702 If they consulted the figures on the Arkansas-Louisiana Gas Company financing, I don't know the degree to which the investigation would go for the purpose of determining what was back of the figures for Arkansas-Louisiana Gas Company. Certainly, in 1936 and 1939 when the bankers undertook that financing, they must have made a study of that company. The degree and the details as to how much of a comparison between the Arkansas-Louisiana Gas Company and the defendants is a matter of judgment. How much further you can go on that, I don't know. The facts about one issue are not wholly unrelated to the facts as regard other issues in the market at a given time. I think my statements with reference to the Arkansas-Louisiana Company would apply to each of the other companies in the exhibit, in reply to cross-examination concerning those other companies.

Cross-Examination by Mr. Slaff.

Similar questions affecting the figures applying to other companies would result in the same general character of answers. The summary statements about the other companies are of the same general tenor. I intended them to have, and they have, the same general purpose.

Redirect Examination by Mr. Booth.

I know that exhibits showing bond yields of public utility companies have been submitted in a number of cases. I know that that is done, but whether it is the ordinary thing to do, I don't know. You ask if I know of any case in which the complete history of the operations of each and every corporation which has issued securities included in the table of bond yields, has ever been submitted at the same time. I am not familiar with that end of it, no. I know that Mr. Gilman submitted an exhibit showing the bond yields of companies that he called natural gas companies.

Cross-Examination by Mr. Morgan (Resumed).

The Cities Service Company covers quite a bit of territory. I do not seem to have anything in here with respect to the source of supply. This company's financing was of a private nature and I therefore had no prospectus on it. Whether or not I omitted to take that out of Moody's information as to the source of supply, I don't know. I would not object to putting in the information about the source of supply. I would be glad to look in Moody's and see if they show anything about it. I can't answer the question as to how many sources of supply it has. You ask if I do not know it is composed of a network of pipelines that are connected to each other in different places so that gas can be transported or transferred freely from one part of the system to another. I don't know the purpose except to get gas to customers. I assume in a system that goes among a number of different communities there might very well be a number of inter-connections for interchange purposes, but I don't know.

According to my exhibit, the company sells gas to local distributing companies operating in Kansas City, St. Joseph, Springfield, Independence, Sedalia, and Joplin in Missouri and Kansas City, Leavenworth, Atchison, Hutchison, Ottawa, Topeka and Wichita in Kansas and Bartlesville, Oklahoma.

You ask whether I know anything more about the facts concerning the El Paso Gas Company than is shown in this exhibit. I have the prospectus on El Paso. I don't recall but I probably looked at a little more than I have got in here, but I don't recall it from memory. I state that it produces gas in Lea County, New Mexico. I don't know
whether Lea County is a very large county or not. I
1703 am not familiar with the geography down there. I
do not know that that is a very large gas field. I don't know whether anybody else is taking gas out of that field except that company.

You ask which is more comparable to the defendants, the Lone Star Gas Company or the Lone Star Gas Corporation. My memory is that the Lone Star Gas Corporation is a holding company and I do not believe it has any direct operations of its own. I am speaking from memory. My recollection is that its subsidiaries participate in all of the four principal phases of the gas business, namely, production, purchasing, transmission, and distribution. I can't visualize Moody on this company's operations any too well, but I will say that it is disjointed, without attempting to disparage the company; as I recall, they have operations in Iowa and also quite a bit down in Texas, so the extent to which there is inter-connections in the system would be limited more probably to their Texas operations, where, as far as I can remember there may well be inter-connections. I do not know that they own gas reserves in 39 different gas fields in the States of Texas and Oklahoma.

You ask what sources I have consulted concerning the operations of Northern Natural Gas Company. That came from Moody's I am pretty sure, because this is also what we term private financing, and we had no prospectus on it. You ask if I know in what fields it produces gas. It seems to me that comes either from the Hugoton Field in Kansas or the Panhandle Field in Texas, possibly from both. I am speaking now from memory. You ask if it doesn't take gas from both those fields and from the Otis Field in Kansas. I have some sort of recollection in regard to the Hugoton and Panhandle Fields. The Otis Field just doesn't click with me at the moment. I will be glad to check up on that if you want me to.

You ask whether my statistical study bears out the observation that in all of these bond transactions of natural gas companies where there is a reliance upon the production as a part of the resources behind the bond issue, the latest maturity of bonds included in the issue bears a date substantially short of the indicated life of the field. My exhibit does not give that information. (Objection by Counsel for Illinois Commerce Commission overruled.) If you mean studies outside this exhibit, I cannot say whether you are right or wrong. I have not made a study of that.

During the noon hour, I checked with our files the eight prospectuses which you handed me just before noon to see whether or not I had them in my files. I have checked them and I have them here. (Objection by Commission Counsel prospectus overruled.) From the prospectus of the Public Service Company of Colorado dealing with the bond issue in the amount of $40,000,000 of First Mortgage Bonds, 3¼ per cent Series, due 1964, dated November 27, 1939, I read at page 23 as follows:

"Property additions must consist of electric, gas or steam property located in Colorado, Wyoming, Nebraska, Kansas, Oklahoma, New Mexico, Arizona or Utah, acquired or constructed subsequent to November 30, 1939, but (among other things) shall not include any natural gas wells or natural gas leases or natural gas gathering and transmission lines or pipes or other works or property used in the production of natural gas or its gathering or transmission up to the

point of connection with any distribution system owned by
the company, except any natural gas transmission line
used for the transmission of natural gas for distribution by
the company when such natural gas transmission line
1704 connects any distribution system owned by the Com-
pany with a source of supply of natural gas (either
gas wells or gathering lines or other transmission line) or
when such natural gas transmission line connects two or
more municipalities served or to be served with natural
gas by the Company."

On page 16 of the prospectus of the Central Illinois Public Service Company $38,000,000 First Mortgage Bonds, Series A, 3¾ per cent, dated December 8, 1938, I see the caption "issuance of additional bonds." Under that caption, I see the following language: "Additional Series A Bonds or bonds of other series may be issued under the indenture without limitation as to principal amount, for any one or more of the following purposes, subject to the conditions and restrictions with respect to the authentication and delivery of bonds to be contained in the Indenture," then follows a colon and three paragraphs set out underneath.

On page 17, in sub-division 3 under that same sub-caption in the third paragraph the words "bondable property" are used. (Objection by Counsel for Illinois Commerce Commission overruled.)

I notice on page 16 in the third line of the last paragraph thereon the two words "bondable property" are in quotation marks, followed by the following words in parentheses "as defined in the Indenture." I would take it that refers to property that as defined in the indenture may be made subject to the terms and conditions of the indenture. It might refer to the original issue of bonds as well as the additional issue. The paragraph beginning with the words "bondable property" on page 17 reads as follows:

"'Bondable property' (as more fully defined in Section 3 of Article II of the Indenture) which may be used as the basis for the issuance of bonds will consist of additional permanent property constructed or acquired by the Company after December 1, 1938, and used or useful, in the electric, gas, or water business, except that bondable property shall not include oil or gas wells and leases, field gathering pipelines and natural gas transmission lines, other than lines interconnecting gas distribution systems." (Objections by counsel for the two commissions overruled.)

I have the prospectus here on Central Power and Light Company of August 17, 1939. I have not seen the mortgage indenture referred to in the prospectus. I have seen the indentures of none of these companies whose prospectus I have here. (Objection by Commission Counsel.)

On page 28 of the prospectus last mentioned, I see the caption "issuance of additional bonds." In the second paragraph, page 29, I see a sub-paragraph with the words "bondable property." The term "bondable property" has the same significance or meaning in this prospectus as it had in the one from which I just read. That short paragraph reads as follows:

"'Bondable property' (as more fully defined in Section 3 of Article II of the Indenture) will consist of additional property, plant or equipment constructed or acquired by the Company on or after August 1, 1939, and used or useful in its electric, gas or water business, except that bondable property shall not include, among other things, automotive transportation equipment, office furniture and equipment, oil or gas wells and leases, field gathering pipelines and gas transmission lines, other than lines interconnecting gas distribution systems."

On page 17 of the Kansas Power Company prospectus, issue of $5,000,000 First Mortgage Bonds Series A, 4 per cent, due in 1964, dated July 14, 1939, I see the caption "issuance of additional bonds". Under that caption on the following page, I see the first paragraph starts out with the words "bondable property". I think the term "bondable property" as used here has the same sig-
1705 nificance as in the last two from which I have read.

That would be on the basis of a certain amount, depending upon the original investment, less this composite accumulation up to that time. That paragraph under the caption "bondable property", page 18, reads as follows:

"'Bondable property' (as more fully defined in Section 3 of Article II of the Indenture) will consist of additional property, plant or equipment constructed or acquired by the Company on or after July 1, 1939, and used or useful in its electric, gas or water business, except that 'bondable property' shall not include, among other things, oil or gas wells and leases, field gathering pipelines and gas transmission lines, other than lines interconnecting gas distribution systems." (Motions to strike and objections by counsel for the two commissions denied and overruled.)

The prospectus of the Idaho Power Company at page 19, contains the sub-caption "Issuance of Additional Bonds." In the sub-paragraphs below that I find a paragraph beginning with the term "property additions". I would expect that term "property additions" to refer to the property additions to be made as a result of the issuance of additional bonds. That short paragraph reads as follows:

"Property additions must consist of electric or gas property, or property used in connection therewith, but cannot include securities, materials and supplies, property used principally and primarily for the production or gathering of natural gas, or any power sites and uncompleted works under Idaho State Permits (see subdivision 'Stations Under Construction' under caption 'Property' herein). In determining net property additions, all retired funded property must be deducted from gross property additions except to the extent of certain credits with respect to funded property which has been released."

The prospectus of the Missouri Power and Light Company, dated December 15, 1936, on page 17 contains the sub-caption "Issuance of Additional Bonds" and on the next page 18 about three paragraphs down from the top, I find a paragraph beginning with the words "property additions" which term, functionally, means the same as in these preceding prospectuses from which I have just read. That paragraph reads as follows:

"'Property additions' consist of additional property acquired after November 30, 1936, located in the state of Missouri or in any other state, if connected with the properties in the state of Missouri, properly chargeable to fixed property accounts and useful in the electric, gas, heat and water businesses. Property additions, as defined, do not include good will, going value, franchises, contracts, securities, choses in action, oil or gas leases or wells, or any property of the nature excepted from the lien of the Mortgage as specified under caption 'Security for the First Mortgage Bonds.'" (Motion to strike and objections by Counsel for Illinois Commerce Commission denied and overruled.) At the top of Page 17 of the prospectus of Public Service Company of Oklahoma, dated February 18, 1936, I find the caption "Issuance of Additional Bonds." About two-thirds down the page, I find a paragraph beginning with the words "bondable property" which term has the same functional meaning as in these other prospectuses in which that term was used. That paragraph reads as follows:

"'Bondable Property' (as more fully defined in Section

3 of Article 2 of the Indenture) which property may be used as the basis for the issuance of bonds will consist of additional permanent property constructed or acquired by the company after January 1, 1936, and used or useful in its electric, gas and water business, except that bondable property shall not include oil or gas wells and leases, nor
1706 gathering pipelines and natural gas transmission lines, other than lines inter-connected with distribution systems." (Motion to strike by Counsel for Illinois Commerce Commission denied. Objection of Commission Counsel overruled.) On page 17 of the prospectus of the West Texas Utilities Company, dated June 6, 1939, I find the caption "Issuance of Additional Bonds." Near the bottom of the page, I find a short paragraph beginning with the words "bondable property" which latter term has the same functional meaning as in the other prospectuses from which I have read. That paragraph reads as follows:

"'Bondable Property' (as more fully defined in Section 3 of Article 2 of the Indenture) will consist of additional property, plant or equipment constructed or acquired by the company on or after May 1, 1939, and used or useful in its electric, gas, or water business, except that bondable property shall not include, among other things, automotive transportation equipment, office furniture and equipment, oil or gas wells and leases, nor gathering pipelines and gas transmission lines, other than lines inter-connecting gas distribution systems."

I have not read the other prospectuses in my office to determine whether or not restrictions or limitations of the same character are rather widely used in prospectuses. You ask whether or not I have found from my reading of prospectuses in the past dealing with the issuance of securities by electric light, gas and water utilities, and by integrated gas companies or other gas companies, it is a rather wide practice to include in the prospectuses reference to that character of restriction or limitation in the indenture. (Objections by counsel for the two commissions overruled.) I know from my study of prospectuses, or from my familiarity with them, that it is the customary practice to contain therein extracts or summaries of material that paraphrase the various terms and conditions that appear in the indenture under which the security is being issued.

You ask whether I find it a wide practice to impose restrictions in the indenture as reflected by the prospectuses which I have just read against the investment of funds to be raised by the issuance of additional bonds under that mortgage in natural gas production facilities and natural gas transmission lines. I again state, as I stated before, that it is common practice in prospectuses to put in extracts, summaries or paraphrases of some of the principal terms and conditions contained in the indenture under which the bonds are issued. That which has been read in the record the last few minutes is prevalent in the mortgages, in the indenture, and I imagine it is extracted and summarized frequently in the prospectuses.

Redirect Examination by Mr. Booth.

I would not want to go so far as to say that the definition of the term "bondable property" which I have just read into the record is common in these prospectuses which I have read. It is common to show in there the definition of some of these terms; but as to certain types of mortgages, telephone company mortgages, they might not make any mention of gas wells. I made no study of how the term "bondable property" is defined public utility mortgages generally; in electric and gas company mortgages generally speaking.

Cross-Examination by Mr. Morgan (Resumed).

You ask if as a statistician I do not know that these restrictions are not put into these indentures by the company. (Objection by Commission Counsel overruled.)

The point is, I have heretofore testified that I cannot characterize the terms and conditions contained in the mortgage as constituting restrictions necessarily. I cannot answer that question without changing my testimony to that effect, it seems. They may be terms and conditions that are in there at the request or the suggestion of the underwriters or the bankers. (Objection by Commission Counsel overruled.)

You ask if that doesn't indicate to me as a student
1707 of finance that the bankers and underwriter are not
willing to have the mortgage impaired by the addition of properties of that character read into the record from the prospectuses setting forth the restrictions. (Objections by counsel for the two commissions overruled.)

All I can say is that I know that the terms and conditions are contained in the mortgage. Why the bankers might request them to be put in would depend upon the circumstances in each case, upon the legal problems involved too, because after all lawyers are the ones who draw up these mortgages. It might very well be a legal question. After all we are talking about mortgages here. The question is what can be put under a mortgage. There may be a legal requirement there. If I recall correctly, some of these referred to the exclusion of leases. I don't know, I am not a lawyer; but from what I do know, perhaps a lease or any similar right is not actual property, like property owned in fee, and can't be put under a mortgage. I think that is a matter of law and other things.

I haven't read the mortgage of the Texoma Natural Gas Company. You ask what purpose would be served by putting a restriction of that kind in a mortgage indenture. (Objections by counsel for the two commissions overruled.) I cannot recite these terms and conditions to which you have referred to as restrictions any more than I have already indicated.

Cross-Examination by Mr. Slaff.

With respect to the prospectus of Arkansas-Louisiana Gas Company about which counsel questioned me before noon, that document on page 6 contains this statement: "Ralph E. Davis, Inc., Engineers, have made a survey of the gas reserves of the company and have also surveyed reserves of others considered by such engineers to be available to the company. The letter addressed to the company summarizing the results of this survey is quoted below." Below that on page 6, and continuing on page 7 on through to page 8, is quoted a letter from Ralph E. Davis, Inc., Engineers, Pittsburgh, Pennsylvania, directed to the board of directors of Arkansas-Louisiana Gas Company and signed "Ralph E. Davis, Inc., Engineers, by Lyon F. Terry, vice-president," which contains a discussion of the gas reserves available to this company.

Cross-Examination by Mr. Morgan Resumed.

You asked me to look during the noon hour and see whether or not Northern Natural was taking gas from any other field than the Panhandle field and the Hugoton field. I have before me copy of Exhibit 162 which contains the statement: "The company's gas supply is obtained principally from the Panhandle field in Texas and the Hugoton and Otis fields of Kansas, as follows:" Then it sets forth the amounts received from the three fields specified and from other fields. They run, roughly, for the year 1938, 22,000,000 M.C.F. from Panhandle; 13,500,000 M.C.F. from Hugoton; 3,000,000 M.C.F. from Otis; and about a million M.C.F from other fields.

In my direct testimony, I testified concerning some assumptions given me at the time and shown at the top of page 7800 of the record. I did that arithmetic as the result of a line of thought that I embarked upon reading the testimony of Mr. Delafield with respect to the inclusion in his eight per cent rate of return figure of 5¼ per cent for risk premium. I turned the matter over in my mind and wondered just what that might mean in the way of arithmetic. You ask if it was my thought at the time I did that arithmetic that part of the risk premium ought to be treated as an accumulation for the purpose of amortizing the investment. I don't treat this as an amortization of investment.

1708 I have added together the amount of the risk premium and the amortization percentage to get a total percentage. You ask if I reached the conclusion that the investment would be amortized in eight and a half or nine years. I did not look at it in that way at all. You ask what use I expect that eight and a half or nine years to serve here. I think it is an attempt to measure the effect of the risk premium of 5¼ per cent, or any other percentage, as far as that goes, as an offset to possible capital loss. I don't think that is treating the risk premium as a part of the amortization of the capital. I am not sure that I know how that circumstance would affect the proper rate of return. (Objection by Counsel for Illinois Commerce Commission overruled.) I was trying to appraise that figure of 5¼ per cent in arithmetical terms, in the sense that I was trying to find out that if he considered that factor together with the amortization, in how many years would it take the two together to amount to the original sum.

You ask why I added that to the amortization reserve unless I was going to use it as a part of the means of returning the capital investment to the company. I think you might consider the risk premium as being an offset to capital loss. If it is supposed to compensate for capital loss, then you might take it as a measure to offset it. It is a pretty difficult thing to express in words, but I think that is the general idea I had in mind. I don't mean capital loss depletion. I mean actual loss of investment. I do not think that the thought occurred to me at the time that there should be no compensation for risk after eight and a half years. I do not recall. (Objection by Counsel for Illinois Commerce Commission overruled.) You ask again why I figured out how long it would take the two accumulations together to accrue the amount of the investment. I am going on the testimony given by others, or it is my impression that your witnesses indicated that this was a risk premium, and it might compensate for the possibility of loss, or compensate for risk, in other words. It was not on the theory also that as soon as the risk premium, together with the amortization, would accrue an amount equal to the capital investment that there should not be any further allowances for risk premium. (Objection by Counsel for Illinois Commerce Commission overruled.) You ask what I mean by amortization. (Objections by counsel for the two commissions overruled.) It is my understanding of accounting that amortization of properties and depreciation of properties is one of the costs of doing business that should be provided for and set up on the books of any company. It serves to recover the capital cost of the property consumed in the rendition of service. I am not saying that this gives you the time at which the capital cost is returned. You ask if I think that any part of the rate of return should be applied as return of the capital. (Objections by counsel for the two commissions overruled.) Certainly, from an accounting point of view, at least, I would not treat the rate of return as representing a return of the capital.

I have said that I made that calculation in an attempt to appraise risk premium. Now, I will try to carry that a little further. If you conceive that the investor asks a risk premium because he is afraid that he may not get some of his capital back, then you could consider the risk premium as an offset to the loss of capital, and you have got to take the two things into account in order to try to measure his net gain or loss. I do not mean net risk over a period of time.

1709 You ask if I mean, as the years go by, between now and the end of 1954, that for every year that passes the risk is reduced because defendants have had the risk premium in the years that have passed. (Objection by

Counsel for Illinois Commerce Commission overruled.) Not precisely. Let me see if I can make some other sort of an illustration. If we assume an investor starts out today with an investment of $1,000,000 and has to be paid back $100,000 of it each year for 10 years, then each year as he gets back part of it, the amount of the investment that he has at risk is reduced. It doesn't mean the amount of risk on the remaining investment is reduced at all. It might be reduced, or increased, or might stay the same. I just said the risk on the remaining unpaid amount may be the same, more or less. That doesn't reduce the risk he still has at stake.

Yes, I have stated that the full amount of the capital invested would be accumulated at the end of eight and a half or nine years by adding the amount set aside for the amortization to the amount represented each year or from year to year by risk premium. No, I don't think it follows that an adjustment should be made at the end of eight and a half or nine years in the compensation for risk if the risk remains the same at that time. I have tried to say the rate of risk might go up or down ten years from now or eight and a half or nine years whatever it is. That is, the investment may be more risky then than it is today. The risk as of that time would have to be appraised and the fact of this accumulation would not be given weight as regards the amount then invested in the properties.

Questions Interposed by the Examiner.

You ask if the amount that would be then invested in the property subject to risk premium should be the total amount invested less this composite accumulation. No, it would be only less the amount that had been returned through operating expenses, something of that nature. I wouldn't deduct the risk premium from the investment in order to find the investment. I think the thought I had in mind is, it would be applied not to the investment the investor would have in the company but to a calculation of the net loss or gain that the investor may incur. That would be on the basis of a certain amount, depending upon the original investment, less this composite accumulation up to that time, from the investor's point of view.

Cross-Examination by Mr. Morgan (Resumed).

That would amount to all of the original investment at the end of eight and a half or nine years. No, I am not saying there would not be anything for him to earn on. I mean there is still something there to earn on. (Objections by Counsel for Illinois Commerce Commission overruled.) I think the confusion here is in confusing two different things. I am talking in this calculation about the investor. I am not talking about the rate base or fair value, whatever you want to call it.

You state that you are trying to find out what is going to result at the end of eight and a half or nine years because I have taken the risk premium and accumulated it, either in a straight line or charging interest on it so as to help make up the total capital investment at the end of that time, assuming the risks are the same on whatever rate base is proper. I didn't have that in mind. This goes to risk premium, not rate of return over-all, but merely the risk premium to the investor as such. You ask whether it would change the amount that ought to be allowed for risk premium for whatever risk turned out to exist as of that time because that accumulation had been made as a matter of arithmetic. I am not clear. I didn't tie it up that way in my own mind. I am not clear on this point.

Redirect Examination by Mr. Booth.

I would not know what the rate of return would be eight and a half years or nine years from now as affected by this calculation.

1710 *Cross-Examination by Mr. Morgan (Resumed).*

You ask me to assume that all the conditions are exactly the same when this accrual has been accomplished at the end of eight and a half or nine years and that the risks are the same, and then ask whether or not there would be any change in the risk premium at that time because of having used the risk premium to help accrue the amount of the capital investment. I think I expressed that as far as I am concerned, as far as I am thinking on it, it would not change the risk. The risk premium might change. It would not change because of the arithmetical calculation, because the changes that come about in time have a given degree of risk. The amount of compensation demanded at one time might be different from that demanded at another for the same degree of risk. I don't know how that sort of thing might work. I don't want to get involved in it.

I do not think the risk would be more or less because of that accumulation. I did not have that in mind. It seems to me the amount of risk that might exist at that time would have to be considered then as the conditions then existing might require. I do not know that I said that this accumulation of risk premium and the interest on the risk premium if I used the sinking fund method should not have anything to do with the amortization allowance. I said I did not consider the risk premium as consisting in amortization.

You ask if in computing the amount of accruals for return the return of the capital invested, I would consider the risk premiums or any accruals to risk premiums as reducing that amount. I may be placing the incorrect interpretation upon your question. If I understand it, my answer is, it is not my thought this accumulation of the two funds together is intended to affect the rate base or the amount allowed for amortization. (Objections by counsel for the two commissions overruled.) It is not intended to affect the amount of the risk premium; but it is intended as an attempt to appraise that risk premium. I tried to give two or three examples of what I had in mind.

You ask me to assume a riveter who works on a steel construction at riveting; that his scale of wages for riveting work in the shop is $10 a day; that if he be working on a building where he goes out on the end of a steel beam eighteen or twenty stories from the ground, that by reason of the risk involved in his position, the scale of pay is $20 a day, that he goes up there and works every day for six months without falling off and killing himself, you ask if that circumstance would affect the risk of going up the next day in the least. I don't think so, and I don't think it should change the scale of his wages.

You ask again why this calculation is in the record in the light of my last two answers, and you ask what I mean by "appraising the risk premium" in my former answers. I am trying to find out what the investor's net loss or gain might be as a result of this risk premium. Obviously, if he receives one risk premium his net loss or gain is different than if he receives another risk premium. I have tried to illustrate that by the example of taking the million dollars today and taking back so much of it over a period of years.

Let's see if we can illustrate that in this fashion by something in the bond field. If an investor paid $110 for a bond today and if it were a 5 per cent bond, and if a year from now he sold the bond or if it were recalled at 105, then his gain would be zero. You ask if I think that is what this testimony and this accrual demonstrates. (Objections by counsel for the two commissions overruled.) I don't understand the antecedent of the word "that" that is
1711 used here. I don't just connect it up with this risk
premium eight and a half to nine years from now. I am not clear on that. I stated in my direct, or in answer to a question you put to me at that time, that I did not do anything about this but the arithmetic. Yes, I did state this afternoon that this represents my conception after I read Mr. Delafield's testimony. I thought it had something to with the interpretation of this risk premium, yes. I have tried to make clear what I have in mind. As I said before, I am trying to show, or trying to measure it from the investor's point of view. It does not go to the matter of the company's aspect of the problem, as I see it.

I don't know what weight is to be given to it or what argument is going to be made from it. I say that this risk premium was intended to protect investors. (Objections by counsel for the two commissions overruled.) It is an investor's requirement. I don't know how you would go from that to rate of return on fair value. That is, what use one might make of the evidence as to risk premium demanded by investors, coupled with rate of return. I am not entirely clear as how you would take that step.

It is my impression that the rate of return is based on the rate base in rate cases. In using $1,000,000 here, I have not necessarily assumed $1,000,000 rate base. You ask what this $1,000,000 is. I think we went into this shortly after I gave my direct testimony. My purpose here is to do some arithmetic and if you are going to do arithmetic, you have to do it with figures, and the matter of the labels you put on them is really not part of the arithmetic, as I see it, necessarily. This $1,000,000 is merely an original sum I have called the "net investment."

Questions Interposed by the Examiner.

I say here in the title "When a return of 8 per cent is allowed on the total investment, "which is $1,000,000. That is not necessarily stated for the purposes of this illustration as a rate base. To be right honest about it, I have tried to use language here which would avoid argument about what the rate base is. My interest here is in the mathematical process. If you are going to argue about those words, you just cloud the issue, it seems to me. The $1,000,000 is the thing on which the return is allowed for the purposes of this calculation.

Cross-Examination by Mr. Morgan (Resumed).

I intended to show here if we have a million dollars and paid it off at the rate of $100,000 a year and also paid $80,000 a year of so-called return, that the results would be to really pay more than 8 per cent on the net investment, the sum. By net investment, I mean the amount that I started out with, less accrued amortization. In other words, I treated the reserve as a measure of the annual payment. I attempted to explain at the last session when I gave this testimony that the way I have used "reserves" might not coincide precisely with the way accountants use it in accounting statements. I can find that if you want.

You ask if this part of Exhibit 182 is offered on the theory that the rate of return at the present time should be influenced by what is going to happen in the future with reference to accruals for amortization. In any rate case, as I understand it, estimates are made as regards depreciation, how much it is going to be, the method used, and so on and so forth. I can't go beyond that.

1712 Yes, if 8 per cent is a proper return then 8 per cent is a proper return, notwithstanding column H to page 1 of Exhibit 182. You ask whether or not column H on page 1 of Exhibit 182 is intended to show what amount should be set up as an accrual for amortization. I don't understand what you mean; but I would like to emphasize that this exhibit here is something which I am very much interested in and which I am going to submit to a magazine for publication if they will accept it, provided, of course, something is not developed here which shows I am wrong. In that event, of course, I would not publish it.

It is merely a mathematical analysis of what is involved in that rate-making formula. I have already said that if 8 per cent is the proper return that it is the proper return notwithstanding this calculation here—and notwithstanding anything else, too. I don't think that this exhibit was intended to deal with rate of return. I am trying to illustrate here, considering all the three pages of the exhibit together, the mathematical assumptions upon which the matter of amortizing something on a sinking fund basis, together with a return on the total amount, are predicated.

Page 1 cannot be taken or considered without relation to the other pages. (Objection by Commission Counsel overruled.) The exhibit is integrated. On page 1 the annual allowance for amortization, as I have used the term here, is set up on a straight line basis. On page 2 it is set up on a sinking fund basis, using a 2 per cent rate of interest in the sinking fund. Page 3 corresponds to page 2, except that 8 per cent has been used for the sinking fund rather than 2 per cent.

Questions by the Examiner.

I arrive at column J on page 3 subtracting column C from column I. That produces a stabilized rate of return of 8 per cent in column K.

Cross-Examination by Mr. Morgan (Resumed).

You ask if the use of the sinking fund method of computation for accumulating an amortization reserve is based on the idea of an undepreciated rate base. (Objection by Commission Counsel overruled.) If I understand the question clearly, it has been my conception that when the amortization allowance that is to be put into operating expense is determined as a sinking fund annuity, then the rate of return is applied to a sum that does not provide for the deduction for amortization accrual. The purpose of this exhibit is to illustrate the mathematics of that procedure.

The figures shown in column K on page 2 are obtained by dividing column J by column G. You ask if I have not deducted the amount of the accrual every year in arriving at the 12.59 per cent return shown in column K. I have deducted the amount of the interest accrual from the return on the full investment without deductions for amortization reserves in arriving at column J; but in order to get to column J I first allowed the full 8 per cent every year on the original amount without deduction for reserve that I show to accumulate here. No, I do not allow it and then take it away. For the purpose of demonstrating the mathematical principle here I make the deduction, certainly. When the accrual is by the sinking fund method I don't do that.

1713 (December 5, 1939.)

You ask if, under the rate making procedure as I understand it, it is not true that the practice has been where a straight line method of accumulation or amortization reserve has been used that the rate base fixed as of the time of the hearing remains the rate base until the regulatory body takes another look at it. (Objection by Commission Counsel overruled.) My conception is that the rate base determined as of any instant of time in any rate proceeding is merely one of the facts arrived at or one of the tools arrived at to assist the Commission in fixing rates as of that point of time. Now, when you project into the future you don't have the same problem before you. I mean rates are not determined over and over again each second or each minute. They are determined once and for the purpose of this instantaneous determination certain conclusions are arrived at, but those bases might change in the future. I think the facts might change is what I am trying to say. They do change. There is no determination of rate base except as to the instant of time, at whatever time the Commission sets forth in its order.

You ask if the fact that there was an allowance in the earnings of an annual amount to accrue for the purpose of retiring the capital or returning the capital, as the case may be, raised the question as to whether or not that accrual could not be put to use and thus be made to earn a part of the total amount of the capital to be returned; and if that is not what gave rise to this sinking fund idea of accruing that reserve. (Objection by Commission Counsel overruled.) My thoughts are not clear as to this matter of earnings including something for capital. As far as that goes I have not had opportunity to make a search to see if there is anywhere anything set forth as to how this thing did arise.

My testimony in Exhibit 182 is intended to demonstrate mathematically what is inherent in my opinion in this rate making formula that is under discussion here. I have set up here in column B on page 1 of Exhibit 182, $100,000 a year. At the end of ten years that amount accrues the whole million dollars that I started out with. You ask if the sinking fund idea does not proceed on the basis that the $100,000 a year, while it is a book entry so far as the books are concerned, in fact represents a part of the total amount received by the company from the rate payer, and the company ought to contribute the amount of the earnings on that $100,000 to the return of the capital in making up that one million dollars. I am not clear. The $100,000 a year representing accumulation of capital. That is what I am making out of it.

You ask the difference between the straight line basis and the sinking fund basis. The difference is the amount allowed under the sinking fund basis when projected over the period upon which the amount was determined does not accumulate to the full amount that was being amortized.

On page 2 I set up $91,327 a year instead of $100,000. I find at the end of ten years it only aggregates $913,270. That doesn't return the million dollars and that is not a true amortization as I conceive it for the purposes of this calculation. This calculation is in two parts.
1714 The two parts are inter-related. That is the whole burden of my testimony, that they are inter-related, and that is why they are applied in the way they are applied. The Examiner points out that on a basis of $91,327 I come out with only $913,270 at the end of the ten years and asks where I get the rest. The rest of it is in two places. As a matter of arithmetic the figures in column C added to the figures in column B give the total. Also the difference between columns I and J, when added to the amounts in column B, give the total. The sum set up in column C represents the accruals of compound interest, figuring at 2 per cent on the $91,327 for the first year, that is, the three columns, B, C and D are a compound interest calculation, using on page 2 a rate of 2 per cent for the purposes of this exhibit.

I have not assumed for the purposes of this exhibit that the 2 per cent is the risk-free rate and that 8 per cent used on the following page is the rate including the risk compensation. (Objection by Commission Counsel overruled.) You ask why I use the 2 and 8. I use those rates to illustrate some arithmetic. You ask whether I did not know that one of your witnesses had testified that for a sinking fund the 2 per cent was a safe rate for the risk-free compensation. I don't see that it makes any difference. That is not the point at all. It had no bearing upon the calculation at all. You ask why I picked out 2 and 8, 2 being the rate that Mr. Delafield said ought to be used and 8 being the lowest rate that your witnesses have said ought to be the proper rate of return in this case. I see now what you mean. I might have known that some one testified to the 2 per cent and I did know there was testimony on 8 per cent rate of return. I merely wanted to get figures that were not too far afield from some of the ideas presented in this case.

This $1,826 set up in the second line of column C, page 2, is 2 per cent on $91,327. I have used an annual basis of accrual. The next year I accumulated in column C $3,689. That is a little more than twice $1,826, due to the circumstance that the interest is compounded in this calculation. By going through that compound interest calculation from year to year I accumulated in column C $86,730 and that amount added to the $913,270 makes up the million that I started out with. It takes the amount of that interest accrual in column C as a matter of arithmetic to add up to the million dollars. My testimony here is intended to explain that that is included, of course, somewhere else; but you have not allowed me to explain the two points of the problem.

You ask if in fixing the $91,327 a year, the annual amount to accrue in connection with the return of the capital, I have deducted from the million dollars, before dividing by ten, the number of years over which I am going to accumulate the fund, just the amount of that accrued interest. I didn't arrive at any such process as that. As I say here in a footnote, $91,327 set aside at the end of each year for ten years, compounded at 2 per cent, will equal a million dollars at the end of the tenth year. You ask if I did not arrive at that by accruing the interest and deducting the accumulated interest from the total amount to be returned and dividing by ten. You are getting over into the second part. If you want to discuss the two parts I am perfectly willing to do that;
but I do not see what you say follows necessarily.
1715 I am not clear on that. You ask if I do not see that

the amount $91,327 set up every year is absolutely fixed by the accrual of that interest there in column C. The amount in column B is fixed by three factors: Rate of interest is one factor; the time is the second factor; the amount being amortized is the third factor. By applying these three factors we get $913,270 to be amortized through actual accruals, not including interest. I do not get $91,327 by dividing $913,270 by ten. I get the $913,270 by adding the ten figures in the column above it.

You ask how I knew how to start out with $913,270. By reference to the standard interest annuity tables is the answer. I don't think that that is just working backwards and doing the very thing you asked me in the question before the last. The end result may be the same, but that is not the way I arrive at that. It is true that after I arrive at it the amount is less than a million dollars. If it is less than a million dollars I must add something to it to make it a million dollars. The point I am making is that in setting up this annual accrual of $91,327 I have set up accruals which return less than the amount of the capital if I consider those figures alone. That is one phase of this method and in order to understand it you have got to relate it to the other phase. When you are ready to consider that I will discuss it.

In my testimony yesterday in which I stated that the practice is that when the sinking fund method is used in accruing the amortization reserve, the rate of return allowance continues to be based on the amount I started out with. If I said that I misspoke myself. You point out that I said: "If I understand it clearly, it has been my conception that when the amortization allowance that is to be put into operating expense is determined as a sinking fund annuity, then the rate of return is applied to a sum that does not provide for the deduction for amortization accrual."

The confusion there is that I am talking about a rate-making formula that is applied as of an instant and time. It is not a projection into the future. The purpose is to fix rates today on the basis of the facts before the deliberating body today, and just as a mere matter of the mechanics of the thing they take today's figures and the so-called amount of amortization is figured as being one thing. The amount of return or the so-called return is fixed on another basis. Now, neither the amount then determined as the amortization is the true amortization, and the amount then determined as the amount of the return is not the true return. Neither one of them stands alone. Throwing them together they can be justified, and that is why they are thrown together. That is why one is paired against the other.

Now, my mathematics is intended to demonstrate that the throwing together does result in an equitable justification of the two independent processes when, but only when, on the basis of mathematical principles the interest rate percentage used to fix the amortization and the rate of return percentage are the same. That is inherent in the mathematics of combining these two related factors and arriving at an overall equitable result.

If I did not tell you what I have just said yesterday I misunderstood your question. You ask if there was 1716 anything about the question, "The use of the sinking fund method of computation for accumulating an amortization reserve is based on the idea of an undepreciated rate base, isn't it?" that I did not understand. I think I was interpreting differently than you were. You say the idea of an undepreciated rate base. What I am talking about here are concepts used as of a given particular time to arrive at the result as of that time. Now, you cannot go beyond that for the purpose of this mathematics.

You ask me if at the end of the third year another look were taken at the situation presented by page 2 of my exhibit here, although the sinking fund would have been applied in accruing the return of that million dollars, if the amount on which the rate of return would be calculated in the light of my statement yesterday would still be one million dollars. I do not think so. You ask what I meant then when I told you yesterday that when the amortization allowance that is to be put into the operating expense is determined as a sinking fund annuity, the rate of return is applied to a sum that does not provide for the deduction for amortization accrual. I think the difficulty there arises that your last question has shifted the base, and when you shift you have got to get all your terms uniform. Now, if I start out today with certain assumptions I project those all the way through the period. Now, if you come down here three years later and start out with a different figure and reproject your sums over some other period, that involves another calculation. The arithmetic of a sinking fund method is that some additional sums are involved in addition to the so-called annuity.

Questions by the Examiner.

As I understand it, the amortization annuity, considering it as a sinking fund annuity, is determined as the sum required to accumulate with interest over the period to the amount being amortized; and when the rate determination is made that is a mechanism used to determine what as of that point and time is a reasonable estimate of the amortization factor to be added to the other costs in order to arrive at the total amount of revenue required by the company, and in order to fix rates to produce that amount of revenue. You ask how my last answer differs from the answer to Mr. Morgan's question. (Objection by Commission Counsel overruled.) The point is Mr. Morgan used the expression "capable of earning." The capacity of this thing to earn is not involved in the fairness of the process and I have attempted here to demonstrate why, because allowance for it is made somewhere else.

Cross-Examination by Mr. Morgan Resumed.

You ask what has been done in the development of this sinking fund principle to the end that you can see how what I have done differs from it. I don't know what regulatory commissions have actually had in their mind when they fixed sinking fund depreciation. I cannot tell whether what I have done is something different from that which has been done because I do not know what has been done. You ask why I am preparing this study with a view of having it published as something original if I think there is any doubt about it being distinguishable from that which has been done in the past. I am doing so because I am attempting to analyze the principles here.

I had in mind a while ago that you asked me what
1717 the reasons were that others had in mind when they
did this sort of thing. I do not know what they had
in mind. I am pretty sure that the mathematical process has been applied and my purpose is to demonstrate that unless these two percentages are the same the process

is being applied along lines different from the principles in the mathematics.

Redirect Examination by Mr. Booth.

I have not felt it necessary to make an historical study for the development of the sinking fund method and its use in rate proceedings in connection with the preparation of this exhibit. I have not made such a study.

Cross-Examination by Mr. Morgan Resumed.

Passing over to Table 2 on the right hand side of the exhibit I have set up there in column 1 $80,000 per year, which is 8 per cent, the assumed rate of return, on the entire one million that I started out with. That adds up to $800,000. Over in the next column, which is column J, in the second line I have deducted from that $80,000 exactly $1,826. In the next line, I have deducted from $80,000 exactly $3,689. When I get through with column J I have deducted from the $800,000 exactly $86,730. When I set up the $91,327 annually the payments alone at the end of ten years accrue only $913,270, but of course, the accrual involves the interest too. No, I have not deducted from the million dollars. I started out with this $86,730 and arrived at the result of $913,270 in that fashion. Yes, I started out with the theory that the million dollars was to be returned to the investor and the additional theory that the investor would get the rate of return on the million dollars or such parts thereof as have not been returned from time to time. Yes, you are right that I did not accumulate in my annual accruals enough money to return the million dollars by exactly the sum of $86,730, without taking into account the interest. The amounts that I show in column B here are less than one million dollars by the amounts that are shown in column C. I did not arrive at my result by deducting from the total amount set aside in the form of annual accruals the amount shown at the bottom of column C.

You ask if when I get over here to column J, notwithstanding my statement yesterday afternoon, I have not deducted from the total amount set aside in the form of annual accruals the amount shown at the bottom of column C. (Objection by Commission Counsel to the form of the question overruled.) That goes to the statement that I made yesterday which I have already explained this morning, that it apparently did not convey the idea I had in mind. I have attempted here this morning to elaborate on what I did have in mind. It seems perfectly clear to me. I have indicated here that I don't think I can answer the question in the form you have asked it. As indicated here on the exhibit, in order to arrive at column J, and for the purpose of the computation, I deducted from $80,000 in the years after the first year the amounts shown in column C and those are the interest accruals inherent in the sinking fund determination of amortization.

You ask if the sum total of it is not that when I get through I reduce the $1,000,000 to be returned by that $86,730 and I reduce the amount allowed as earnings by just exactly that amount in my column J over there. No, the sum total of it is that I have returned all of the original investment and in addition paid an average of 12.59 per cent there instead of 8 per cent which was the assumed percentage in the first place. That is 12.59 per cent on the net investment.

Questions by the Examiner.

1718 The difficulty goes to the fact that apparently what I said yesterday was not clear; and I have attempted to clarify it this morning.. Therefore I can't answer on a different construction from what I said yesterday as to the thing I had in mind. The difficulty, you see, is we are shifting bases here, Mr. Examiner.

You ask if I can't answer it by relating it to my answers of yesterday and clarifying it again. I thought I clarified it once. The thing I had in mind in my answer yesterday at page 9233 of the record was that the mere mechanical process was gone through at the time of the determination of a particular set of rates in any rate procedure. Now, I projected that into the future to see its effects and that is what I am trying to do here; but the bases may change in that projection. They do change in my opinion.

Cross-Examination by Mr. Morgan Resumed.

You ask if the rate shown in column I isn't exactly 8 per cent if I use in this computation the undepreciated rate base or the undepreciated amount of $1,000,000 with which I started out. I apply 8 per cent to the original million dollars to get this $80,000 as so-called return; and my testimony is that it is not true return over the period. It happens to be, as a matter of arithmetic, the return in the first year, but the arithmetic, carrying it on, attempts to analyze what this $80,000 does mean, and what the amortization annuity does mean, because those are parts of a whole. This relates back to another problem in simple annuity calculations in which the two things are treated as a whole. Here they split up differently from the division made in the ordinary annuity problem; and that is where a lot of confusion arises.

I have used what purports to be the sinking fund method, although in Table 2 I purposely, in order to illustrate the thing, applied the principles erroneously and in Table 3 I come to my interpretation of the correct application. As a matter of arithmetic I applied the sinking fund method of computing the amortization reserve first on 2 per cent in Table 2 and on 8 per cent compound interest bases in Table 3. (The witness begins to answer a question which the Examiner allowed company counsel to withdraw over objections of Counsel for the Illinois Commerce Commission.)

In making the observation as to the figures shown in column K, Table 2, that it winds up with an earning of 12.59 per cent as appears right here in the exhibit, that amount is obtained by dividing the figure in column J by that in column G. You ask if G is the depreciated rate base from the first year throughout the ten-year period. Not necessarily. That is not the way to look at it. That is not the way I am looking at it.

You ask how I got this $908,672 on line 1, column H. This was intended to be column G less column F, but there seems to have been a rounding off of a dollar there. It does not click exactly.

You ask if this 12.59 per cent is not 12.59 per cent on the depreciated rate base. I am not using rate base in this exhibit. It does not appear in this exhibit. You ask if it isn't the earning on the million dollars depreciated annually by the amount of this accrual over there. It says so right here; yes, certainly, that is the average over the period, the average rate of return on the net investment.

1719 You ask what my understanding is of the procedure sometimes used in rate making whereby the rate of return is applied to an undepreciated rate base and the annual depreciation expense determined on the sinking fund basis. My understanding is that for the purpose of that particular determination at that point in time, two different computations are made in order to arrive at an overall whole. You ask if my counsel did not ask me, as appears at page 7808 of the record, this question: "'Are you familiar with the procedure sometimes used in rate making, whereby the rate of return is applied to an undepreciated rate base and the annual depreciation expense determined on a sinking fund basis?" to which I answered: "Yes, I am"; and if my counsel did not then ask me the question: "What is your understanding of that method of procedure?" and if I did not answer: "As I understand it, when the annual allowance for depreciation expense or amortization is determined on a sinking fund basis the rate of return is applied to an undepreciated rate base in order to ascertain the amount of the return." Yes, I so testified. You ask if I have done that in arriving at the figures shown in column K of the exhibit we have been discussing. As I understand it, I used that process to arrive at these figures and then I have carried them on to column K and analyzed it.

Questions by the Examiner.

You ask what I mean by that process. At page 7808 of the record, line 13, I started with my conception of that procedure and having obtained those instantaneous values or sums resulting from that procedure, I proceeded to project and analyze those sums. That is the basic underlying principle by which I arrived at the initial sums with which I started and then I am continuing it to analyze those. I said here on direct that "When the annual allowance for depreciation expense or amortization is determined on a sinking fund basis the rate of return is applied to an undepreciated rate base in order to ascertain the amount of the return." Now, I determined with respect to a million dollars as a starting sum the two factors mentioned there in just that manner, if I understand the matter, and then in this exhibit I have proceeded to continue those things on and try to analyze their significance in relation to the basic principle of rate making.

Cross-Examination by Mr. Morgan Resumed.

You ask if I had stopped with columns A, B, C, and through to I, inclusive, my exhibit would not have been in conformity with the procedure I described at pages 7808 and 9233 of the record. (Objection by Commission Counsel overruled.) Your question involves so much I don't know where to stop on the thing. It involves an entire re-explanation of the whole process. (Objection by Counsel for Illinois Commerce Commission overruled.) I think here even in columns A to I, inclusive, I go beyond the instantaneous principle and analyze it over a period of time. You ask if I do not go beyond the procedure which has been followed in the sinking fund method of accruing amortization reserve as this exhibit has been carried out. I don't go beyond the procedure in order to arrive at my starting sums. Then I go ahead and analyze those. Those two columns, J & K, are a part of my analysis of the procedure as I understand it and I can't segregate these things out to that extent.

1720 Table III is also a sinking fund computation as far as the determination of the annual allowance for the amortization on an 8 per cent sinking fund basis is concerned. You ask if it differs in that I use an 8 per cent interest rate for figuring compound interest in order to arrive at the amount to be set aside in column B each year. I don't think that is the correct statement of the procedure. I use 8 per cent not to figure the compound interest that results from it; but I use the 8 per cent as the basic factor in determining how much the amount in column B must be. You have to determine column B first. I used 8 per cent in determining the amount to be set out annually in column B. That results in the setting up of a less amount by the difference between $91,327 and $69,029. I arrive at B first. The amounts in column C are not determined from B. They are obtained from column E which carries forward both columns B and C.

You ask if I have in arriving at the result over in column K used as the basis of computation to which I apply the 8 per cent assumed return the depreciated and not the undepreciated amount which I originally started out with. I don't wholly agree with that at all. In order to get column K I relate what I would call the true return to the net investment; but in order to get the true return I have first to get this 8 per cent overall. Thinking now in terms of investment rather than rate base, the purpose of column K is to test the original 8 per cent and the original amortization assumption with which I start off. That is the way the testing comes about, I think. I am not using the term rate base in this exhibit.

The $490,290 shown as the sum of the figures in column J is divided by the average net investment over the period in order to get the 8 per cent shown at the foot of column K. You ask if that is the average depreciated investment. It is the average based on the net investment. You ask me if in Table III as well as Table II of Exhibit 182 I have used the sinking fund method of accruing the amortization reserve and have in arriving at my final result over here in column K used a depreciated rate base and not an undepreciated rate base. My answer will have to be "No" to that question as stated.

Cross-Examination by Mr. Slaff.

Following the question and answer that were read to me by Mr. Morgan from page 7808 of the record, the following questions were put to me and I made the following answers on direct, beginning in line 18, page 7808, of the record:

"Q. Will you state what you mean by the determination of the annual depreciation expense or amortization allowance on a sinking fund basis?

"A. That method of determining the annual depreciation expense or amortization allowance consists simply in finding that sum, called an annuity, that would accrue to the full amount to be depreciated or amortized if the annuity were set aside in a fund and compounded at the rate of interest used to determine the required amount of the annuity.

"Q. If the return were allowed on an undepreciated rate base but the annual depreciation expense were determined on a straight line basis, what would be the effect as regards the rate of return earned on the depreciated rate base over a period of years?

1721 "A. In that case, as regards any given rate base, the rate of return on the depreciated rate base would increase year by year.

"Q. That is, if the rate of return were originally fixed at, say, 6 per cent the rate of return in subsequent years on the depreciated rate base would rise progressively above 6 per cent, is that correct?

"A. Yes, sir.

"Q. If the annual depreciation expense were determined on a sinking fund basis and by use of an interest rate of, say, 2 per cent, and if rates were fixed so as to provide a rate of return of 8 per cent on the undepreciated rate base, what would be the result in subsequent years as regards the rate of return on the depreciated rate base if the annual interest accruals on the depreciation or amortization reserve at the rate of 2 per cent were deducted from the mount of return?

"A. Under those conditions the rate of return on the depreciated rate base would also rise year by year but less rapidly than in the case of the previous example.

"Q. If the annual depreciation or amortization allowance were determined by the use of a 6 per cent rate of interest and a rate of return of 6 per cent were allowed on the undepreciated rate base, what would be the result in subsequent years as regards the rate of return on the depreciated rate base?

"A. Under those conditions the rate of return on the depreciated rate base would remain at 6 per cent in subsequent years if the annual interest accruals at 6 per cent on the amortization reserve were deducted from the amount of return.

"Q. Can you state as a general principle that when the annual depreciation or amortization expense is determined by use of a rate of interest equal to the rate of return, the rate of return on the depreciated rate base will remain at the same percentage throughout a period when the interest accumulations on the amortization reserve are deducted from the amount of the return.

"A. Yes, that can be demonstrated."

That which I have just testified was what my Exhibit 182 was intended to demonstrate and in my opinion that is what it does demonstrate.

Redirect Examination by Mr. Booth.

The document you hand me is headed "National Association of Railroad and Utilities Commissioners Report of Special Committee on Depreciation Principles and Methods Submitted to the National Association of Railroad and Utilities Commissioners at Its Fiftieth Annual Convention in New Orleans, Louisiana, November 15-18, 1938". On page 8 there is a heading that carries the number 10, and the heading, which is in italics, reads as follows:

1722 "If the sinking-fund method is used on connection with an undepreciated rate base the sinking-fund interest rate should be the same as the allowed rate of return."

Then, the material following in regular type reads as follows:

"In the event the sinking-fund method is used with an undepreciated rate base, the so-called interest on the sinking-fund depreciation reserve should be removed from operating expenses and treated as gross income deduction for the purposes of the rate proceeding. The sinking-fund interest rate should be the same as the allowed rate of return in order to compensate for the fact that no depreciation is deducted from the property. If the sinking-fund interest rate is less than the allowed rate of return, the combined depreciation and return allowed will be excessive in an amount equal to the difference between the sinking-fund interest rate and the rate of return times the depreciation otherwise deductible in determining the rate base."

The theory expressed in the language I have just read is in part certainly the theory of my Exhibit No. 182. The men who were on the committee which made that report were as follows:

Cesel R. Colbert, Wisconsin, Chairman;
John C. Damon, Securities and Exchange Commission;
W. D. Dittmer, Illinois;

E. H. Merrill, Utah;
J. Donald Murray, West Virginia;
W[illegible] Norfleet, Federal Communications Commissions;
Harold E. West, Maryland.

Question by the Examiner.

You ask me to identify those names for you, Mr. Examiner. I know Mr. Colbert was for a time on the staff of the Wisconsin Commission. I don't know whether he is still there or not or what his capacity is. Mr. Dittmer was supervisor of rate investigations of the Illinois Commerce Commission. I do not know any of the other gentlemen mentioned there.

Cross-Examination by Mr. Morgan Resumed.

As I understand it this is just a report of a committee. It is the 1938 report. Ordinarily committees report every year so the probabilities are they have made a report to the 1939 convention. I don't know whether this is a recommendation or what it is intended to be. It is just a statement of thoughts on the matter, I suppose. I don't know whether that paragraph was repeated by report or not for 1939. You ask whether or not the National Association of Railroad and Utilities Commissioners sanctioned that report. I don't know whether or not it ever took any action with respect to the report.

1723 You ask whether as a matter of fact that is a recommendation varying the procedure that has usually been followed in proceedings where the sinking fund method of accruing the amortization reserve was resorted to. (Objection by Commission Counsel overruled.) I don't know what the purpose of the statement is. I don't know what it was put in there for. All I know is that I was handed a document and asked to read it. I did not refer to it in compiling my Exhibit No. 182. I think I had seen that report before I prepared the exhibit. I have seen it some time. I certainly had no recollection of it at the time I prepared Exhibit No. 182. In other words my Exhibit No. 182 was prepared independently of that report. I think over all it agrees with my exhibit. I would hate to say it agrees entirely. I am referring to the paragraph I read. It looks to me they are stating the same thing I am trying to analyze mathematically here.

You ask if my position simply is that the rate of interest that should be applied to the annual accruals for the purpose of amortizing the total investment should not in any way be related to the earning which could be accomplished by applying that fund to investment at a risk free rate of interest. (Objection by Commission Counsel overruled.) I am trying to recall the answer I previously gave to that question. My point is as I understand the mathematical principles where under the rate-making formula which we are discussing can be justified, the sinking fund rate of interest should be the same as the rate of return percentage, and that sinking fund rate of interest, therefore, has no more relation to the ability of the annuity to earn money than does the rate of return itself.

You ask what is the difference in the practical working out in calculating the amortization reserve on a sinking fund basis using the allowed rate of return as the compound interest rate and accruing it on a straight line basis, and reducing the rate base every year in advance of a hearing as to whether it ought to be reduced. This analysis does not go to what the regulatory commission does in subsequent years. It goes to the mathematics inherent in a projected analysis of what the regulatory commission does as of a given time, trying to project that to see what the interpretation of the procedure is.

You ask if I don't get exactly the same result if I apply the straight line method of computing the amortization reserve and then apply the rate of return to the rate base that I start out with less the amount of the accrual every year as I would accomplish if I followed the procedure outlined in Table 3 of Exhibit 182. I don't know what you are referring to, what results you want me to compare. I will have to know what result I am supposed to compare. You ask if I apply the rate of return to the depreciated rate base, and accrue the annual allowance for amortization purposes as I have done in Table 1 of my Exhibit 182, I get to exactly the same result as to the earnings that are allowed as if I had used the procedure shown in Table 3 of that exhibit in the ultimate washout, namely, 8 per cent on the undepreciated rate base.

In Table 1 I arrive at amortization in the amount of $100,000 a year or $1,000,000 for the ten years. Now, an 8 per cent return on the net amount of the investment, year by year, would give the amounts of return shown in Column I, which total for the ten years $440,000. Consequently in Table 1 I arrive at a total of $1,440,000 for amortization and return, and in Table 3 I arrive at a
1724 nominal or so-called amortization in the aggregate
sum of $690,290, and at the so-called amount of the

return over the ten-year period of $800,000, the total for the so-called amortization plus the so-called return, thus aggregates $1,490,290. Also on Table 3 I would arrive at $1,000,000 as the true amortization, and at $490,290 as the true return, again giving me a total of $1,490,290 for the two items, and the total for the two items of amortization and return that I arrive at in Table 3 is thus somewhat more than the corresponding total I arrive at in Table 1.

The accrual is set up at a more rapid rate in the first instance than in the second instance, this is due to the fact that net investment declines more slowly under the compound interest method than under the straight line method; therefore you have a higher average net investment for the period.

No, when I get through with the calculation I have not allowed an earning of just 8 per cent on the amount I started out with less the annual accruals. I have allowed the earning all the way through, but I merely combined it differently. I don't take anything away from the figures. They are all there. I just simply split them up in two different fashions here. I allow an amount in each instance which is the sum total of $1,000,000 plus 8 per cent on that $1,000,000, less the accruals to reserves from year to year during the period. I allow in the aggregate an amount sufficient to amortize the entire million dollars and to pay 8 per cent on the unamortized portion every year. That is the same amount that is obtained by the other process.

Cross-Examination by Mr. Slaff.

In that connection I believe I referred to the return shown on Table 1, $440,000 over the ten-year period, as my conception of the true return. The comparable figure of return corresponding to that figure, as shown on page 3, Table 3, where I use the same rate for the rate of return and for interest accrual to the sinking fund is $490,290. That is what I call the true return in the case of Table 3. The latter figure over the whole period in dollars comes to some 10 or 11 per cent more in the sinking fund method. The $490,290 exceeds the $140,000 by 10 or 11 or 12 per cent, roughly.

Cross-Examination by Mr. Morgan Resumed.

You ask if under the procedure in rate making proceedings where the straight line method of computation has been used, the rate base is reduced as between one regulatory proceeding and the succeeding one by the actual depreciation without regard to the book accruals. (Objection by Counsel for Illinois Commerce Commission overruled.) I am not prepared to answer the question. I can't even say as to whether the Illinois Commerce Commission does that. You ask me if I know whether or not this procedure I have outlined here in either one of the three tables I use in Exhibit 182 conforms to the ordinary procedure. (Objection by Commission Counsel overruled.) I have not actually made any thorough-going study of precisely the processes gone through. I have only my conceptions as to the principles. You ask if I am not offering this as something new to be applied in the field of rate making. It is something new to me. I have never seen it before.

Redirect Examination by Mr. Booth.

You ask whether the California Commission has consistently followed the same principles which are contained in my Exhibit 182. I don't know.

1725 You asked whether I have made an approximate calculation of the population indirectly served by the Natural Gas Pipeline Company of America. I have gathered some figures in connection with that. According to the 1930 census the city of Chicago had a population of about three and one-third million. The latest estimate I have seen is one that purports to show the population of Chicago as of January, 1939, and that estimate was three and two-thirds millions.

With respect to the area served with gas by the Public Service Company of Northern Illinois, I added up the 1930 census population figures for all the communities and arrived at 604,000. The company, however, states that they consider the area in which they serve gas to have a population of 690,000, a larger figure, which may be due either to using later estimates than the 1930 census or to including population on the fringe of a municipality that would not be included in my census figures.

In like fashion I arrived at the following information for the Western United Gas and Electric Company, in its northern division only. That company reported to me that they considered the area of the territory served to have a population of 347,000. By adding up the census figures of the community I arrive at only 288,000.

In addition, Peoples Power Company, who obtains gas from Natural Gas Pipeline Company of America, serves four towns with gas here in Illinois. There are a few communities through Iowa and Nebraska that appear to receive gas service upon the basis of some gas, at least, obtained from the Natural Gas Pipeline Company of America.

Taking the census figures of the population for the Peoples Power Company's four towns and these few towns in Nebraska and Iowa, I arrive at a total population for those particular towns of 306,000. Now the figures there—I have given different figures for the same thing, depending upon dates and sources.

The total will probably run from four and three-quarters to four million eight hundred thousand. I did not include a little town out in Kansas that I understand gets gas from the Pipeline. I couldn't find the population figure for it anyway.

You ask whether I was questioned by Mr. Morgan about studies of comparison of rates of various companies and their use in rate cases. I do not recall what I said about their use in rate cases. I said something about making comparisons from company to company. He questioned me about rate comparisons. I thought he was asking me as to what I had in mind or what I did when I said I made rate comparisons in giving my qualifications. I recall there was a proceeding before the Illinois Commerce Commission involving the application of the Peoples Gas Light and Coke Company for a rate increase.

You ask whether Dr. Paul J. Raver, who was at that time the head of the rate and research division of the Illinois Commerce Commission, prepared a table of comparison of rates, attempting to compare the rates of the
Peoples Gas Light and Coke Company and other large
1726 cities served a mixture of natural gas and artificial
gas. I remember that Dr. Raver compared something along those lines. My recollection is very hazy on it. I know it went to that general subject. You ask if I recall

whether an effort was made to submit it as testimony before the Illinois Commerce Commission and it was refused. I seem to have such a recollection that there was a refusal at one time to put in that exhibit. It seems to me the ruling was made by the Examiner, not by the Commission. I do not recall whether it was ever appealed to the Commission or not.

Cross-Examination by Mr. Slaff.

I have a prospectus of the Lone Star Gas Corporation on the $20,000,000 issue of 15-year 3½ per cent sinking fund debentures due in 1953, dated August 25, 1938. On page 17 of that prospectus the first paragraph is captioned "Gas Reserves". The first paragraph following that caption reads as follows:

"Ralph E. Davis, Inc., Engineers, have made a survey of the gas reserves of the Lone Star Gas Company, Lone Star Gasoline Company and Community Natural Gas Company, the three subsidiaries which produce and purchase all the natural gas for the System except such gas as is purchased for distribution in El Paso, Galveston, and Brenham, Texas, and Guthrie, Oklahoma, and Council Bluffs, Iowa. This survey covers reserves of gas available from System's production properties and reserves controlled by the System through gas purchase contracts. The letter addressed to the Corporation as the result of this survey is quoted below."

(Prior to the reading of the above quotation the Examiner, at the request of counsel for defendants, announced that the language read would be limited to the purpose of showing that the firm, Ralph E. Davis, Inc., Engineers, made an estimate in connection with the Lone Star Gas Corporation's financing.)

Immediately below the language I have read on pages 17, 18 and 19 there appears a copy or what purports to be a copy of a letter from Ralph E. Davis, Inc., Engineers, Pittsburgh, Pennsylvania, dated August 3, 1939, addressed to the board of directors of the Lone Star Gas Corporation, 100 West 10th Street, Wilmington, Delaware, signed by Ralph E. Davis, Inc., by Alden W. Foster, vice president, which deals with the reserves of the System.

I have here the prospectus dated August 17, 1939, of Oklahoma Natural Gas Company in connection with the $17,000,000 First Mortgage Bonds, Series B, 3¾ per cent, due August 1, 1955; and also the 58,000 shares of 5½'s Convertible Prior Preferred Stock. The fourth full paragraph on page 13 of that prospectus is captioned "The Gas Supply". Following the caption appears the following language:

"A copy of the report of Ralph E. Davis, Inc., on the natural gas supply, valuation of gas producing properties and oil and gas leases of the company, is filed as an exhibit to the registration statement, to which reference is hereby made. The letter summarizing certain portions of the report is quoted below."

1727 Below the language I have just read, on pages 13, 14, and 15 there is a letter from Ralph E. Davis, Inc., Engineers, addressed to Mr. Joseph Bowes, President, Oklahoma Natural Gas Company, Tulsa, Oklahoma, signed by Ralph E. Davis, Inc., Engineers, by Gail F. Moulton, vice president, which deals with gas reserves of Oklahoma Natural Gas Company. (Objection by Company Counsel overruled.) The first paragraph of that letter reads as follows:

"In accordance with your request, we have made a study of the natural gas supply available to Oklahoma Natural Gas Company for the purpose of estimating the natural gas reserves controlled through lease ownerships, through gas purchase contracts and available in fields presently connected to the pipeline system. We have also carefully considered the availability of gas in other fields in this territory served by the company and the prospects for the discovery of additional gas supply within a reasonable distance of the company's present lines."

You ask if from there on that letter deals with gas reserves available apparently to that company or to its system. They talk about a field investigation and adequacy of the reserves, and the company's requirements, and so on and so forth.

Recross Examination by Mr. Morgan.

On page 6 of the same prospectus of Lone Star Gas Corporation from which I read a few minutes ago there is an outline map or symbolic chart which bears the title "Major Territory Served by Lone Star Gas Corporation and Subsidiaries". (Objection by Counsel for Illinois Commerce Commission overruled.) There is a footnote to that explaining that some other territories are not shown. There is a tabulation on the page which carries the caption "Gas Fields". The tabulation then proceeds to list 39 of them or 39 things called gas fields. I don't know what the technical description is. From that caption I think it is intended to be a gas field. On the map there are various green spots. According to the legend those are gas fields and each one of them is numbered. The list, which is numbered from 1 to 39, shows the names of each of those fields and identifies them by this numbering system.

Redirect Examination by Mr. Booth.

I don't know anything about the reserves in any one of those fields. I don't know whether the total reserves in the 39 fields listed there are less or more than the reserves of the Texoma Natural Gas Company in the Panhandle Field.

Exhibit 185 submitted by Mr. Knapp shows the revenues for Peoples Gas Light & Coke Company for 1938 to be in the amount of $37,976,207. The figure shown for 1938 in the annual report of the Peoples Gas Light & Coke Company to its stockholders at page 7 thereof is $40,462,775.12. That appears to be indicated as total revenues. The corresponding figure for 1937 is $39,318,161.61. Now whether those figures are on the same basis as appear in Exhibit 185 I would have to check to see. The figures disagree and that is why I would have to look. The corporate and the consolidated revenues ordinarily do not agree.

1728 FRED KLEINMAN, a witness for complainant, called for cross-examination, testified as follows:

(December 5, 1939.)

Redirect Examination by Mr. Booth.

You ask if I have anything additional to say with reference to the exhibits that I presented that I did not state at the time I testified on direct. Yes, I noticed on reading the transcript of the evidence that I neglected to comment on one item contained in Company's Exhibit No. 141 which is involved in the calculation I made. That is in my Exhibit No. 188. That item is shown on line 17 of page 2 of Exhibit 141 and deals with replacement contingencies of ten per cent. The amounts involved vary from $6,439 in 1939 up to $36,417 in 1945, and intermediate amounts for other years. The total involved is $267,346 over the entire life of this property as shown on Company's Exhibit No. 141.

Originally in setting up my exhibit I was faced with the logical assumption to be made on the basis of the information contained in that line. The replacement contingencies of ten per cent are mathematically ten per cent of the capital expenditures for replacement and the cost of retiring capital replaced less the salvage value of retirements. It seemed to me an illogical assumption to make that all the amounts would be exactly in the noted amounts for each year, and the total amount involved being comparatively small, and having no real effect on my exhibit except to reduce, if these replacement contingencies happen, the cash on hand at the end of this property's life by $267,000, which is small in view of the other figures. I therefore merely left that out.

Cross-Examination by Mr. Morgan.

I graduated from Cornell University in 1913 with a degree of Bachelor of Arts. I did not major in the field of accounting. I majored in philosophy and psychology. I did not take accounting work in connection with my university training. When I left the university I went immediately with the Brooklyn Union Gas Company in a clerical position. I learned accounting in connection with my practical work. My accounting training has been of a practical character rather than formal. My tenure with the Brooklyn Union Gas Company extended over a period of about four years. I don't know now exactly what my designation was. I was employed in the general office of the company. I was not an official.

My work was changed during the four years because I was engaged first in the branch office located at Newtown, one of the subsidiary companies of the Brooklyn Union System. At the end of two months I was transferred to the general office in the auditing department. I received no special titles or anything else. I naturally gained after only two months with the company in the capacity of a clerk

no knowledge of accounting. I think my duties were covered in my direct testimony. I did other work besides
1729 just the low grade clerk's work. I started very, very small. I began at $52 a month with the Brooklyn Union.

The National Aniline and Chemical Company at the time I was employed was a recent merger of several of the largest dye stuff and fancy chemical producers in the United States. They had engaged a Mr. George W. Yates, who had formerly been comptroller of the American Tobacco Company, to put in a new general accounting and cost accounting system. Naturally with several companies in the one new company you would have to install one uniform system of accounting. I was engaged directly by Mr. Yates to act as his assistant and worked on that job. I began the general ledger for the company, ran it myself for a while and instructed somebody else how to run it. I worked entirely under his jurisdiction on putting in a general and cost accounting system for that company. My work with that company was strictly of an accounting character.

I began with the Emergency Fleet Corporation as assistant local auditor and at the end of one year became local auditor. My position there was the head of the accounting department and I was one of the two people hired who were charged with the duty of signing the checks to the contractor, which was the Submarine Boat Corporation, for their expenditures under the terms of the contract. I signed the checks subject to a countersign. The other man signed subject to my countersign. It took two signatures to make the check valid. In my work with the Emergency Fleet Corporation I was dealing strictly with accounting matters.

When I went with the firm of Barrow, Wade, Guthrie & Company, public accountants, I was a staff member working on accounting. I said in my direct testimony that while employed by that firm I worked on a variety of accounting work, but from 1925 specialized in utility work and principally in the investigation of utilities prior to the purchase of the utility, either as property or as a company, by some banker or some holding company. By that I mean I worked on the accounting features of utilities. I went over their figures and their accounts and books and dealt with them from the accountant's standpoint.

You ask the names of the natural gas companies on whose records I worked during that period. I can't give you the names of the natural gas companies on whose record I worked. The work on natural gas companies which I did was primarily in connection with three pending mergers into a new company. One of them actually became a company known as the Duquesne Gas Company, located in Washington, Pennsylvania. The other two. One was going to be called the Western Pennsylvania Gas Company and the other the Pittsburgh Natural Gas Corporation, I think, never became a company since the bankers for whom I was making the investigation failed in their attempts to finance it.

The properties which I examined in that connection were very largely holdings of individuals and small corporations who had been drilling wells and attained gas and who sold their entire output to the natural gas companies op-
1730 erating in the Pittsburgh area. Some of these properties, instead of selling, were using the gas themselves. I am thinking now about H. C. Fry Glass Company that had developed a gas field for use in the manufacture of glass.

My connection with those natural gas companies and the individuals whose properties were involved were of an accounting nature. It was my duty to ascertain the net income for a period of three years prior to the date I was making my examination for ultimate certification by my firm to the bankers for use in the prospectus in bringing out the securities on the properties, if, as and when they mere merged. My duty was to make an audit, pending certification, as to what the earnings were and then to make up various types of pro forma balance sheets reflecting the various types of financing which the banker thought he might try to use in financing his deal. I didn't originate the type of issuance because that was the job of the bankers' own employees.

I stated that when I was with Leidesdorf & Company, public accountants, of Chicago, my principal activity was to advise and consult with the Illinois Commerce Commission, "principally again with regard to the electric rate case of the Public Service Company of Northern Illinois which was then pending". You ask what is the significance of the word "again". I had used "principal" and using it the second time I wanted to show the particular activity I had been working on for the Illinois Commerce Commission was this one electric rate case. I did not have any general duties at that time. I had had no connection with the Public Service Company of Northern Illinois prior to that time. I didn't mean "again" in the sense of the second time as to the Public Service Company, but the fact I had used "principally" and I wanted to narrow it down specifically to the work I was doing for the Commission.

1731 I can give you a number of the companies with which we were concerned when I was with Barrow, Wade, Guthrie and Company. The American Gas and Power group, the Standard Public Service and Associated Public Utilities group. The first one was primarily electric and gas; the second was primarily telephone and water. They were holding company systems. The operating companies were far too numerous to remember. Some of these companies had fifteen or twenty smaller companies in there. We are talking about something that is a quite a number of years ago. I could, if you are interested, find a complete list. However, to be indicative of the type of company, I think the largest individual and complex utility I worked on was the Tidewater Power Company and the Pinellas County Power Company. Tidewater had electric, gas, heat, street railway, bus, toll bridge, amusement park, and hotel, and I think several other activities.

You will notice I am looking at Mr. Woodford. We were both associated together at that time and he remembers perhaps more vividly than I do the activities of these companies.

The largest water company I worked on was Consolidated water Company of Utica, New York. The largest individual Telephone company I worked on was Ashland Telephone Company in Kentucky.

The names of some of the other holding company groups were National Public Service, American Commonwealths Power Corporation.

I am an accountant, Mr. Morgan, and all of my work has been the work of an accountant. I did not have anything to do with the issuance, the purchase, or the sale of utility securities or the securities of other types of industry except in the matter of doing accounting studies and accounting reports. My title now is Chief of Accounts and Finance of the Illinois Commerce Commission. I said in describing my duties as chief accountant I have charge of all the accounts, general supervision of the accounting department, of the Illinois Commerce Commission. You ask what my duties are as chief of the Finance Department. I sit as hearing examiner in the more important finance cases presented to the Illinois Commerce Commission. Before a utility can issue securities which are to be outstanding for more than one year, they must receive the authorization of the Illinois Commerce Commission. The utility therefore comes before the Commission with a petition asking for authorization to do what they want to do. It is my duty to sit as hearing examiner. In the smaller cases I often delegate that duty to my principal assistant, Mr. Tholin. In the larger cases I sit myself, making my own investigation and advising the Commission on the merits of the company's proposal.

That work goes somewhat further than dealing with the figures involved in the financing. The Commission expects me to point out to them any proposal of a company which would lead to an unbalanced capital structure; any proposal of a company to pay excessive interest rates or excessive fees to underwriters; or to have unusual terms in their mortgages or their indentures; and all the other facts which would be pertinent for the Commission to know to make up their minds as to whether authorization should be granted to the utility to do as they seek. The information from which to test the issue is based on general knowledge and experience of what other companies in the field have been able to do and are doing and on the testimony presented by the company as to the particular circumstances in the particular case, as to why it is reasonable or proper to do as they wish to do.

I stated I testified in several rate cases. I testified on
rate of return in only one of those, that of Peoples
1732 Gas Light and Coke Company. In the Public Service
case and the Commonwealth Edison case I was testifying on income available for return. You ask if that was an auditing or accounting feature of the case. It is an accountant's duty to ascertain the recorded income available for return. Of course, that requires a knowledge of rate making principles and general knowledge of how utilities operate their business in order to advise the Commission as to what were unjust or unreasonable charges, or what might be unjust or unreasonable charges if I am not able to determine of my own accord what is unjust and unreasonable.

You ask if in those two cases my testimony then wasn't really of an auditing character to determine the propriety of charges in arriving at the earnings available for return. I think that both attorneys would object if I said "Yes," because after all, what I am determining is the facts relating to the income and expense of the company, those facts being presented to the Commission; then the Commission determines what is reasonable and what is not reasonable. I then testified what I found the facts to be concerning the charges, with such comments on the propriety of those charges, or on the status of those charges, that occurred to me. I made an independent investigation of my own to determine the reasonableness of the company's charges to the operating expenses and the amount which the company included as their revenues, and where I considered any item unreasonable or questioned its reasonableness, I set it forth for the Commission to look at and make their decision.

In the case of Peoples Gas Light and Coke Company I testified as to rate of return. I don't remember the date when I testified. It was in 1937, I think. That case is over but is still pending in the courts. So far as the Commission is concerned, it is a closed case. The Commission handed down its decision, and it is now up to the Attorney General of the State of Illinois to defend that decision in the courts.

I had nothing to do with either of the two volumes constituting the study of the staff of the Federal Communications Commission on rate of return, to which reference has been made in this record. I did some work on that subject, as I have stated. I rendered a report to my immediate supervisor which set forth my opinion of the status of the problem on which I was engaged. I did not complete my work. I left rather hurriedly. The funds for the investigation were running out, and the work was discontinued completely about four months after I left.

The annual reports filed by the Illinois utilities are forwarded to my department for review. They include the number of customers by various classifications, the quantity sold, the total dollars realized on that quantity. They include special inserted pages for breaking down those figures by rate schedules. They show the reported gross and net earnings of the companies.

You ask what I have to do with them personally after they are filed with the Illinois Commerce Commission. I give a few of the more important companies a look to see if there is anything novel or startling; but I handle the annual reports as a routine matter which one of my assistants takes over. He has an audit manual prepared, which I have approved, for work by my department, setting forth every operation to be done on these utility reports; which my men proceed to do. When a question arises as to whether things are correct or incorrect, they report to him in the first instance. He corresponds with the companies.

After he receives the answer from the company, if 1733 the answer appears to be satisfactory, that ends the matter. If, however, it does not appear satisfactory to him, then they are referred to me. I only personally get into those matters where my assistant believes something should be called to my attention and possibly to the attention of the Commission. You ask if my department then undertakes to analyze these reports from time to time. Not analyze. That primarily falls on Dr. Dittmer, the superviser of rate investigation, and Mr. Ostrander, the supervisor of the rates and research section. I check them for accuracy, and completeness, as far as we can, see that they are properly prepared and that they are annual reports that the Commission can use for their further purposes.

In connection with my duties I have promulgated a revised system of accounts, or sponsored a revised system of accounts for electric and gas companies. Yes, I am a member of the Committee of Statisticians and Accountants for Utilities of the National Association of Railroad and Utility Commissioners and have been since 1935. That is somewhat poorly worded. The correct name is the Committee on Utility Statistics and Accounts. The committee is a committee of the National Association of Railroad and Utility Commissions. I was not a member of the Special Committee on Depreciation which made a report in 1939. Dr. Dittmer was the representative of our Commission on that committee.

Referring to my statement on page 8030 of the record that for the period 1925 to 1933 I was almost continuously in touch with the financing of corporations, you ask if that had to do with accounting activities in connection with the financing of corporations. No, it went deeper than that. The bankers would make up a proposed capitalization of the company they were going to form or recapitalize. I would then be charged with the duty of reflecting those facts in a pro forma balance sheet, which was largely used in those days, to present to all interested parties what the company would look like after the proposed financing had gone through.

As those proposals were charged, and as the negotiations went further and further to conclusion, various of the terms of the financing would be changed; it would be my duty to prepare a new pro forma balance sheet; so that I actually became thoroughly familiar with what was happening during those negotiations in order to reflect the latest proposed facts in a statement which ultimately the firm by which I was employed was called upon to sign.

The assumptions and the estimates upon which those pro forma estimates were based were the assumptions and estimates of others. I had to understand what the various proposals were and what the then state of the negotiations was. I used that knowledge in preparing an accounting statement. The executives would come in and the banker's man would come in to see what it would look like if I did so and so. Then I would have to get all the information which I knew I needed in order to prepare the balance sheet. It was not necessary for me to know why the banker was insisting on a price of eighty-five instead of ninety, or why the promoter for whom I was working was willing to raise the interest from 5½ to 6 per cent.

I knew what the financing was all about. In fact, while it was not my duty to give them any advice, naturally, in the financing, I knew what the financing was going to be.
1734 Then we used that good old formula of dividing earnings by 15 or multiplying by 6, and that would give us the amount of bonds that could be put out, and things like that. It was not as if I had worked on only one or two of them. I worked with the bankers right along. They knew me and I knew them, and we worked together on the negotiations. They did not consult me concerning the negotiations. When I stated that my experience was sufficiently continuous and detailed to permit critical judgment of a situation, I meant I was in a position to pass judgment on the figures when I got them. I was not consulted by these bankers as a financial adviser, but I was intimate with these people and discussed the proposals which were put out at all times. I knew what the financing was. I knew what other companies were doing. Of course, they relied

to some extent upon my advice, but I had no responsibility for such advice. I was working for a firm of public accountants, and public accountants merely make up the statements. They take no fees for financial advice. That is not a part of a public accountant's duties.

You ask if it is not a fact that the security issues which have been referred to me as an examiner or to my department and assigned by me to Mr. Tholin have had to do largely with bond issues. (Objection by Counsel for the Illinois Commerce Commission overruled.) I don't know that that has any bearing on the particular discussion. What you want to know is whether the security issues referred to the Illinois Commerce Commission were mostly bonds. Both in numbers and in dollars they were mostly bonds. There were, however, very substantial amounts of stock. The single largest item of stocks were, of course, the Commonwealth Edison stock, that being one of the largest corporations in the city; and the volume of stock ultimately to be outstanding as proposed, and for which they received authority to issue, is, I believe, somewhere in the neighborhood of 165 or 170 million dollars. As to smaller companies we have before us now a proposal (which the Commission is inclined to deny, and which the company is inclined to change) to issue $450,000 worth of common stock and $450,000 worth of preferred stock.

We have another proposal which is dependent on whether the company will be able to purchase the properties which they are trying to purchase, which will required somewhere in the neighborhood of $400,000 worth of stock. We also have had during the past two years bus companies in more or less large amounts; everything from $1,000 up.

You ask whether the issues I have mentioned had to do with public issues of stock or with consolidations and reissues of stock. The Edison is a public issue. The others, most of them, were privately taken, not issued through underwriters or offered to the public generally by any means. Utilities in the State of Illinois can only issue securities for the acquisition of property or for refunding of securities previously issued for the acquisition of property. That is statutory. You ask whether some of these involved stock transactions where the properties were acquired directly through the issuance of stock as opposed to raising money for the buying of property. We had both types of transactions. Some of them, of course, were properties proposed to be constructed. Particularly in the last few years, I think, we have had three requests for capitalization of pipelines from the new Illinois oil fields to various places. There the property is not in existence at the time. They receive authority of the Commission to issue securities for money to be used for the construction of property.

As a whole, I would say that the great bulk of the financing which has come under the jurisdiction of the Illinois Commerce Commission has had to do with bond issues. There have been some stock transactions covering the entire period. There was not much of it in the first part, ex-
cept in the transportation field, bus companies. Later
1735 there have been more substantial issues for other
types of companies. When I say the entire period, I mean the period of my tenure with the Illinois Commerce Commission.

One large electric company which has financed through the issuance of common stock within the past four years, under the jurisdiction of our Commission, is the Commonwealth Edison Company. We have two small gas companies who have financed through the issuance of common stock. This was not for the raising of additional cash capital. The gas companies have had no real use for additional capital throughout this period of depression. Most of them were using the moneys accumulated through depreciation funds. There have been no gas company issues for the purpose of raising additional cash capital that I recall right now. The sale of the Commonwealth stock was in part to the public for cash. It was a sale to certain specified numbers of the public for cash. They received authority to sell to not more than twenty purchasers and not less than 25,000 shares to any one.

You ask whether, in my statement on page 8033 in which I referred to my accounting and business experience, I meant by business experience my official acts. I have never been engaged in business. I have had to give consideration to the factors which constitute risk in business. You ask what constitutes a risk in business. A risk in business means the venturing of money due to a decision that somebody is making. Sometimes the decision may be negative and money is ventured just the same.

For example, a man might own a thousand shares of U. S. Steel stock. He is, of course, at all times faced with the problem: shall he hold on; shall he sell? His decision may be to hold on. He is, nevertheless, venturing in that stock the amount of money which he has invested in that stock, or which he can get out today if he decides to sell today.

Primarily the decision is the thing that creates the risk or constitutes the risk. Primarily a risk means a decision you are making, to venture some money one way or the other, with the understanding, of course, that it sometimes has a negative aspect of holding on to what you have, or not venturing money but keeping it in idle funds. You ask whether it is the decision or the thing that confronts the man who makes the decision that constitutes the risk. Well, that is, I think, getting into a metaphysical distinction, as to whether it is the decision or the act of the man. He has either an investment which may be disposed of today or idle funds which he may invest today. He may be faced in business with all kinds of problems which the management must decide upon, the problem of: what will we do with our employees who are asking for increasing wages? Will we buy cotton today for our manufacturing or will we sell short today and get the cotton goods manufactured and buy the cotton as we sell the goods? Will we keep our plant open or will we shut it up? Will we run full force and manufacture for inventory, or will we run half force and merely take care of orders we have today? Will we raise our prices? Will we lower our prices? Each one of those decisions is a complex of all kinds of business factors, and being that complex the management must face the entire complex and make a decision, "What are we going to do?". In making that decision they take a risk regardless of which way they decide. There is no way of not taking a risk when you make a decision in business.

Questions by the Examiner.

You ask what I call the adverse factors that the risker
has to face. The risk is present whether the factors
1736 are adverse, or the contrary. The business man can-
not escape risk.

Let us take a man in a steel business. He knows that in manufacturing steel he needs iron ore and he needs scrap. The price of scrap is rising. Shall he contract for three months' supply, or shall he not?

Now what ultimately is going to be the result of that decision is, if he contracts for a three months' supply at today's price and the price goes up, he has made more money. If he does not contract and the price goes up, he has made less money than any competitor who may have contracted today.

Those are risks in business men must take. Once having sent out that purchase order, "We will buy for delivery day by day three carloads of scrap," the man is taking a risk. He cannot escape that risk. He is in the steel business. He must make up his mind one way or the other.

Now, he may get scrap first and decide, "I will pay you as I use it, whatever the then market price is." That is also a risk. If his competitor buys at today's market and he buys at the future market and the price of scrap goes up in the meantime, he is behind his competitor. If it goes down he is ahead of his competitor. That is the risk he and his competitor must take to stay in business, and there is no way of escaping it.

You ask what I call the element that produces the risk, that characterizes the thing as a venture. The fact that he either does or does not do a certain act necessary to be decided immediately, make a decision necessary to be made today; it cannot wait, which will ultimately result in either a better profit or a worse profit, depending on which side of the question his decision ultimately rests.

That is the real risk in business. That is the reason why General Motors may make a large amount of money and Henry Ford a small sum of money. That is the only risk that there is in business. Risk in business does not mean contingencies; it does not mean that we may get a wave of Communism that will blow up the plant. Those are not risks in business.

The risk in business is that in order to stay in business today I must make certain decisions. I must sell at today's price or hold back; I must close my plant or keep it open. Those are the risks; the way you decide all of those risks, which are constantly occurring, is the way your profit and loss account is going to look at the end of the period or whenever you look at it, and it means substantial sums of money. As all accountants know, when you get to the end of the year and you find out that this company in November is getting ready to manufacture for next spring's sales and contracted for so and so many bales of cotton at such and such a price. It is now January 1st. I go over the balance sheet and I find out that the contract that they let,—sound according to their opinion,—is for four cents a bale more than today's price; that is, four cents a bale on all the bales loss which we take into consideration right then and there and write off as loss for that year, and must write off as loss. That is risking money. When they sign that purchase order, that is risking money. There is no way to get away from it.

1737 *Cross-Examination by Mr. Morgan Resumed.*

You ask whether I think that is the kind of risk which the "decisions" talk about when they say that compensation in a regulatory proceeding involving rate of return should be in proportion to the risks involved. I think that since the utilities are competing for all the capital in all the world with all the other businesses in the world, that naturally capital is going to take into consideration that there are those types of risks, and I think those are the only real risks that there are in business that are important enough to be reflected; that those are the factors of risks that must be taken into consideration.

You surely cannot use that company "A", which is practically in the business of gambling its money in the cotton market—for example, a cotton converter whose principal gamble is: What is the cotton market going to do—you cannot take the return in his business and ignore that kind of risk and then say that this utility is going to pay the same for capital that he is going to pay or is entitled to make the same amount of profit that he is going to make if he is guessing right.

You ask me to assume that a man decides to buy cotton at 10 cents a pound; that he makes the decision which, I have said, may result in his losing money if it should go to 9 cents a pound. You ask whether the risk is made up of of the decision or the danger that it might go down to 9 cents a pound. The risk is made up of the situation that being in that business he must either buy his cotton to manufacture with, or manufacture and buy his cotton as of the day he sells. He must make that choice. That choice is a risk. You ask if it is the choice that constitutes the risk. Aren't you getting a little fine spun in that? It is that whole complex. He is in business. He must do one or the other. That is the risk that he has to take in his business every day of the year.

You ask whether or not in the sentence from the case of

Willcox *vs.* Consolidated Gas Company, 212 U. S., page 19, reading: "What may be a fair return for one may be inadequate for another, depending upon circumstances, locality, and risk", they are talking about internal decisions that the management may make. If they are talking about rate of return, they must feel that if you are going to compare utilities with non-utilities, that all of the risks of non-utilities must be taken into consideration and all of the risks of utilities must be taken into consideration, and a balance struck and a judgment made.

The risks of all utilities are not the same. To some extent it depends on the decisions of the management as to whether they are or not. Probably while decisions that are made by utility managements do not involve the risks of money to the same extent that they do in ordinary business, nevertheless, when the utilities in the State of Illinois decided to buy their coal from the Peabody Coal Company instead of on the open market, they took certain risks. They decided that they would pay a cost plus price which may today be lower than the market price and tomorrow higher.

No, the Illinois Commerce Commission, which has under its jurisdiction the gas company that employs coal and oil as raw products from which to manufacture gas, would not concern itself with whether they had or had not
1738 bought their coal in large or small volumes. You ask
if they would concern themselves with whether they had bought their oil over long-term or short-term deliveries in arriving at a proper rate of return for the risk involved. First, in arriving at the allowable operating expenses, and, secondly, since that is a risk which the management must face, the Commission must give due consideration to that risk in appraising where, in the scale of returns that all kinds of capital earned, the company's return shall be fixed.

You start from the most riskless security known and you go up to the most speculative investment known. Where in that long range shall a utility's return be fixed? It shall be so fixed, as I understand it—and I am willing to concede it is primarily a legal matter—but it means an evaluation of all the risks of all kinds of business, all kinds of capital; then to what rate does this company's risks entitle it? They must appraise all of the risk. You ask if I mean by that that they must appraise all of the company's decisions. They must appraise the net result of all their decisions, not each and every one, but how does this company operate? What risks do they necessarily have?

We must face, for example, that here in the City of Chicago management with sound business foresight built certain types of properties throughout this city. Certain areas around the loop have now become known as depressed areas. Now, that is the risk that the management had to take. At the time they built they could not foresee—I do not think it is possible for them to foresee. That is the risk the management has to take in Chicago.

When you are operating in a small town, for example, in territory like C. I. P. S., you are asked to build a line out to a coal mine, the risk that you take or protect yourself against is a risk of putting an investment in property to serve that coal mine. If the utilities do not want to take the risk, they demand a down payment or contribution for extensions from the consumer, which will relieve them from taking the risk.

You ask me to state in connection with the depressed area illustration that I gave what the risk was that confronted the owners of that property when they bought it. The risk was that they changed money into property by a decision to build, let us say, underground construction or 6-inch gas mains. Now, once that decision was made that money was venteured. That is the risk of that amount of money. The risk was that they might build property which subsequently they might have to tear up as being useless. It is the danger that confronts the man who has made the decision or who is considering making the decision that constitutes the risk. The danger is the thing which causes the loss, not the risk. Risking money is not to lose it. Risking money is to gain. You risk money in order to gain, not to lose.

Now, certain contingencies cause the risk to turn unfavorable and cause a loss. Change in the complexion of the city in this depressed area caused that to become a loss. Four blocks away the same risk was taken. No loss was incurred, possibly, because the consumers clustering around the neighborhood brought a very substantial profit about;
but the risk was when they took the decision to build
1739 the property. You ask if they both did not take the
same risk when they made the decision to buy the
property. If the amount was the same, they took the same risk. One of them lost money and the other made money,

that is right. You ask which it was that was confronted with a risk when he made the decision, the man who lost or the man who profited. Both. The decision was the thing that constituted the risk, and you are compensating utilities for the kind of risk they undertake. That is one of the kinds of risks that a utility operating in large cities does undertake. You compensate them for the kind of decisions they must make, not whether they are good or bad, but the kind of risk they must take, that they cannot escape.

If you wanted to ship a quantity of gold from New York to San Francisco by Chicago, you could get Lloyds, or some comparable insurance company, to insure the safe transportation of this commodity across country. The risk that confronted Lloyds, if it happened to be the insurer, would be the possibility of having to pay you for any loss that was occasioned during shipment. You pay Lloyds a premium, and they take your risk. If you are in the kind of business where you naturally want money in one place moved to another, that is a risk that you take, just as often as that condition arises, that you cannot escape from. You can pay a premium and shift it to Lloyds. But I have in mind one particular kind of business, the diamond business, uncut stones, where the margin of profit will not permit present insurance rates, on the authority of a friend of mine in that business. The premium is so high that if he were to pay it, he could not possibly make any money. He therefore has to take the risk, including the risk of being held up and shot.

You ask if the decision to transfer gold from New York to San Francisco had been made last July, would it have cost the same premium as if made today. I do not know whether rates on shipment of gold between those places have gone up in the meantime. I don't know whether it would or would not cost more now. I think American rates of trans-shipment might very readily have remained the same, in spite of a war in Europe. I don't know whether that is true or not. I have not followed those kinds of insurance risks. I am talking about both shipment by water and by rail. You wouldn't ship gold by water. That is too expensive a proposition. You would probably ship it by rail, by the fastest express you can take, because quite a number of the fastest trains on American railroads are commodity trains and not passenger trains.

The risk that you take if you take ordinary life insurance is that you might pay for a good many years and ultimately recover a smaller sum. Insurance people are not insuring you against dying. They charge a certain premium because they take the risk, and they pay a certain sum when you die or to your heirs when you die. They protect themselves against your going into professional aviation by providing for an increased premium or a cancellation of the policy. In other words, under those circumstances they evaluate the risk as different from that of an ordinary man.

Now you ask why I say that the risk is constituted by the decision. The answer is because business is a continuous series of acts of various kinds of various employees of the business concerned. In connection with those acts the management must make decisions. This decision is the kind of a risk they take. The risk is there before they make the decision. It is something they must do. Their only alternative is to take this sort of an out on the risk, or another sort of an out. The risk is there. They must risk that money because they are in business.

You ask if the risk involved in buying gas leases down in the Panhandle and building a pipeline from those leases to Chicago, drilling wells on those leases, and providing
compression equipment for moving that gas from
1740 those leases to Chicago did not exist before the own-
ers ever decided to go into the business. Some risk confronted them, if they had the capital to go into a project, as to what they are going to do with the capital, leave it idle, put it in government bonds, or do something else with it. At the time any one of these particular people began to engage in the natural gas business he undertook certain types of risk in a certain amount. You ask if I don't think that the risks that ought to be considered by the Federal Power Commission in arriving at a power rate of return were already there long before these men ever made up their minds to acquire leases of that kind and build a pipeline to Chicago and put gas through it. I can't see any risk that was there. I was alive at the time. I had no risk in connection with that project; merely the man who was going to venture his money into it, as of the day that he first ventured his time or invested his money in it. Then with respect to the amount of money he put in, he undertook certain risks. You ask, were not the risks which he found himself confronted with after he made his decision already there facing him before he made the decision?

When you say "Were not the risks that faced him after he made the decision," do you mean by that the risks that are now facing the defendant? When he made a decision to invest a certain amount of money in this project, he then risked that amount of money in the project.

Now whether that risk of money was profitable or unprofitable would depend on the gradual development of subsequent circumstances. The risk was taken. Now, from then on the risk that faces him is: Shall I hold on to this investment I have made, or shall I sell out?

You ask if I think that when a man or a group of men contemplate an enterprise that involves an original expenditure of $60,000,000 or more, that they are going to give some thought to the risks that are confronting them at the time they are thinking about it before they make up their minds to put their $60,000,000 in. I think now you are using risks in two different senses. The risks that they tried to evaluate at that time were, I presume, the possibility of getting their money back and making a certain return on their money while they had it out on this project. That is the risk which they evaluated as far as they could at that time.

Questions by the Examiner.

Yes, they do that by the process of considering and weighing factors which militate against their chances of getting their money back and weighing that against factors which enable them to get their money back and possibly a good return. You ask if those factors which they weigh, though they are of a negative kind, are not used to militate against the possibility of success in the matter of risks. You cannot take, in any business proposition, only four or five negative, as you call them, factors. You must take all of the factors. A business risk might have fifty negative and one good strong positive factor which outweighed the fifty negative, and a business might have fifty positive and one good strong negative factor which outweighed the fifty positive. What anybody must do in the appraisal of risk is to determine what is the relative balance of favorable and unfavorable symptons.

You ask if, in considering these factors which appear in some other industry, related, you do it by comparing characteristic factors in the two industries. If we were to make, as I was called upon to do, the appraisement of the

risks of this business and the return that it is therefore
1741 entitled to, I would take as large a group as I thought was desirable for study and then appraise what are the characteristics, favorable and unfavorable, of risking money in this business, what are the characteristics, favorable and unfavorable, of risking money in another business. I would probably give a little more weight to those that were closer in characteristics. The rate of return at which I arrived would be about 6 per cent. That was arrived at by weighing the returns derived from risking money in various kinds of industries. I mean by that risking as an investor in those industries. In doing that I employed all of the favtors. You ask if I mean, eliminating common factors or grouping common factors and giving it weight and then giving the distinguishing element of my characteristic factors weight. My answer is "no." I gave consideration to all of the risks: How difficult it is to wind up at the end of the year with a reasonable profit in a certain line of business, and what kinds of profits and losses naturally do these businesses make.

If I were to take and compare the Natural Gas Pipeline Company with other natural gas companies, I would evaluate all of their risks, all of the risks of this company as against all of the risks facing the other natural gas companies. Then go from there to utilities and, ultimately, if I wanted to make a comparison between the Natural Gas Pipeline Company of America and industry generally, manufacturing and processing and merchandising industry generally, I must look at the risks that face manufacturing industries, merchandising industries, and compare those risks with the risks that faced the Natural Gas Company of America, and try to strike some kind of a balance between those risks, in order to effect a judgment as to how much more or less than those industries earn is the Natural Gas Pipeline Company of America entitled to earn.

But I cannot say that the risk that faced Chrysler, for example, with this strike, which has just cost them a large amount of money, that that is a risk which I must ignore. Of course, that is the very kind of a risk, when I look at automobile earnings, that I must take into consideration, that the automobile people are now faced with a labor problem, that the labor problem can cause them a strike that will cost them a great deal of money. Naturally, if they are going to take that risk, it must be compensated for, or they will all go broke.

You ask whether the labor problem is a risk. Of course the labor problem is a risk of industry. It is one of the basic risks facing all industry today, where the cost of labor is a very substantial amount of the cost of your final selling price.

Cross-Examination by Mr. Morgan Resumed.

You ask what decision on the part of the management does the labor problem risk depend on. A great many. Ultimately it might depend on a decision of whether to fight a strike or give in. You ask whether it is the decision that arises when the strike is immediately impending that constitutes a risk. That is a pretty late date to face that risk. They are facing that risk all the time. How shall we treat our employees? How shall we do it? The Chrysler strike was supposed to be caused by the speeding up of the belt line. It was that original decision—in order to make money and sell our cars for a certain amount we want the belts run to move so and so fast, otherwise we cannot make a profit or the profit that we ought to make on this car—having made that decision, to price their product at that particular set-up of prices, they then had to work their belts so fast that the men kicked and ultimately struck, and Chrysler lost a lot of money, variously estimated.

1742 You remind me that I stated in connection with my direct testimony that I had given effect to the particular risks that I mentioned here, which I said prevailed in other industries and did not prevail in these companies, involving questions of decision, such as the accumulation of inventory; and you ask if that is the character of risk that I appraised in arriving at 6 per cent as an adequate return. Yes, because where that factor is present to a great extent in a business, as for example in merchandising, they are entitled to a larger return because of undertaking that risk than they are if that is not present.

You ask what distinction I draw between risk, as that term is used in a rate of return study, and hazard of loss. I thought I explained that a while ago. Risk means what you undertake to do which may result profitably or unprofitably; but when you make a decision, from that time on factors beyond your control determine whether it is going to be profitable or unprofitable. That is the risk that business in general is faced with, all business.

You refer to my statement at page 8038 of the record: "In a discussion of risks in business it is necessary, in my opinion, to distinguish between the continuous actions of conditions surrounding an industry and the continuous risking of money by the companies in industry," and to my further statement: "The first set of factors in general determines whether the industry will be profitable as a whole. The second set of factors determines the relative prosperity of the companies within an industry. The risks arising out of the continued commitment of money in a business are much more important than the risks arising out of the conditions surrounding an industry." You ask if I meant in those observations that the risks arising out of continuous commitment of money are much more important in a rate of return study. Of course I was leading up to rate of return, but I also mean much more important as an underlying factor of business. I was talking about industry in general. The one principal risk which the management or the entrepreneur in your property took in the first place was this: It cost $60,000,000 to build a pipeline. Is that justified by the amount ~~of~~ gas we have in the ground, taking into consideration the possibility of selling that gas in Chicago? They had a lot of other risks besides that one, but that was the one big risk, that was the paramount risk that they had, because if the gas was not there, if there was only enough gas for four years, you could not get $60,000,000 out to pay for your pipeline.

You ask if I meant by what I have said that having put their money in and built the pipeline, that the risks that are involved in the decisions which the management makes from time to time are the important thing, rather than the over-all risk running over the period of time that their money will be in the pipeline. I made that statement about business in general. Now, when we get down to the Natural Gas Pipeline Company, there are certain risks that the management is undertaking from day to day and from time to time. Every time they add a new interruptible customer on the line; every time they are faced with the question of shall we sell our gas to the industrial customer or shall we hold it for the residential and commercial consumer; every time they decide whether it is going to pay them to put in a new piece of equipment or whether they shall let the old one run for a while with such necessary repairs as can be made; whether the wastage of gas is enough to warrant an investigation or whether it is small enough to let it run,—those are all problems of management, as to whether they shall put so much money into labor or material or undertake to supply gas to this person or that person.

1743 In your particular line of business the day to day risks are comparatively small, I mean compared to business in general. I think most any business man will bear me out that you have a much easier business to run than an automobile business, for example, or Marshall Field's, and companies of that nature.

Now, the risk surrounding your property as a whole, which was a factor in the first place, by today has had certain years of development. The money having once been risked, some of the bondholders have their money back or have part of their money back. The stockholder has already received his three hundred or four hundred per cent dividends on his stock. It does not owe him very much. It was a profitable venture, even if he never got another nickel on his common stock.

You ask if the fact that it has been a profitable undertaking down to date ought to be used as a means of discounting the risk that still confronts defendants. I think that should get some consideration. I am not saying that because you made four hundred per cent dividends that you are not entitled to any dividends from now on. That is a legal problem as to whether you are entitled to these dividends or not, but as to the man who originally said, "Let's put our money into this proposition," and put his money into the common stock, nobody can say to him at the present time that he made a bad investment. He has got his money back four times over and still has a piece of paper that is worth a lot of money.

Yes, defendants together have certain risks surrounding them. You ask if I took those risks into account when I made the comparison between the business and operation of these companies and other companies which I mentioned in my direct testimony. I took them into account. I gave them, I think, complete valuation. But I say that that type of risk is a smaller one and much less important one than the type of risk that faces somebody that is in the steel business or in the automobile business, and if I am going to look at the rate of return made by people in the steel business or in the automobile business I must give full consideration to the fact that the Natural Gas Pipeline Company does not face anything like the risks that they face, in the matter of winding up with a profit at the end of a year, due to the activity of the management.

You ask if in determining risk it is necessary to examine into the matter from the basis of what will probably happen or the thing which might happen to a business of this kind. The thing that will probably happen gets most of the weight. I think every eventual contingency should get proper consideration, every contingency facing this as well as every other business. When we are talking about compensation for risk in connection with an investor, we can in part talk about probabilities, things that we can see down the line that are going to happen in all probability.

You ask if I think anybody would invest his money in a venture if he thought there was a probability that that investment was going to fail by reason of some contingency. Yes. You say his investment might fail, but people are buying stocks on the stock exchange right today at fairly sizeable prices that have not made a profit in a great many years, in the hope that maybe it will turn around and make a profit for them some day.

1744 Now the probability is that if you pick any one stock, you might in all probability make a loss, but the hope that these investors have, is that "if we pick five stocks and one of them comes through with a profit, we will have enough to compensate us for the money we risked in all five out of the one venture that turns profitable," and that is the reason you will find stocks on the stock exchange that have had losses for a great many years still selling for dollars per share.

When an investor is thinking of buying or not buying a certain stock, the risk that he appraises is: What are my chances to get my money back and a return either in the interim or an appreciation at the end of the period of time?

You remind me of my testimony on direct that "the risks arising out of a continuing commitment of money in a business are much more important than the risks arising out of the conditions surrounding an industry. The latter are slower and can be met over a period of years." You ask that we apply that principle to the railroad industry. You ask what major risk confronted the man who put his money in railroad securities, particularly common stock securities, twenty years ago. If you are going back twenty years, one of the major risks of investors was the honesty of management. Now, as far as the railroad industry itself is concerned, one of the risks that they faced at that time was the ability to overcome the change in the transportation habits of the American people to the automobile and away from railroad travel. You ask whether they have overcome that risk over the years or whether it is still with them. It is still with them. You ask if that risk has reacted upon their returns and upon the yields of their securities. To some extent. I think that the railroads that do a great deal of crying about the things that affect them are to some extent to blame themselves for not recognizing the factor of obsolescence and depreciation in their accounts, and continuing to pay dividends instead of plowing it back into the modernizing of their property. It was only at the very depth of the depression, the very worst time they could pick to gamble their money in the railroad business, that they started with streamline trains and new equipment. Up to that time the cars were run and used just as long as they could use them; the oldest equipment was still kept alive.

I think today the railroad industry might be in for a new lease on life if they would wake up to the fact that they are running an industry. They have to face industry and its problems the same as any other business man. They have to keep their equipment up to snuff if they are going to compete with airplanes, and buses and trucks. I think if they keep alive to that problem they can still come out; but if they are going to sit back and say, we want an increase in freight rates, or we want an increase in passenger rates, I think they are headed for the ash can.

You ask what investors think of railroad securities at the present time. Well, right at this time there has been a spurt in railroad securities. Prices have gone up. They hope even second class railroad bonds will earn their interest this year, and maybe that the railroad industry will come out. I think that by and large today's prices are a pretty good reflection of the status of the railroad industry and its chances for paying out on today's basis. As to whether they will ever be able to pay out on a 100 per cent of their capitalization, I think it will take a pretty strong optimist to express a favorable opinion on that subject.

1745 You ask if the great hazard or risk involved in railroad investment today is not the bus, the truck, the private automobile, and the airplane. That and the way management conducts its business. How many trains are they going to run? We get, in the Illinois Commerce Commission, railroads coming in and saying, "We want to take off this train, we want to take off that train." We have railroads going down to Washington before the Interstate Commerce Commission saying: "We want to make an increase in our freight rates. It is true we will lose a certain amount of business, but we think we will be better off over-all." I think as long as railroads stick to that kind of thinking there is not much hope for them, because I don't know of any industry that can make money by charging more and selling less of their product. I only know of industries who can make money by charging less and selling more of their product.

If the railroads try to give the best service that they are capable of, at the lowest price, and move America's commodities, I think they will be in the money again; not at capitalization, but what I think they are really worth. It is not that they could or could not have done it but just that they have not overcome the hazard which confronted them twenty years ago from competition. I think they are very slow in realizing the effects of that competition. We know that for years the railroads uniformly refused to have anything to do with bus and truck transportation. They would not go into the bus business. They would not go into the truck business. Today most of them own bus lines and truck lines.

You ask if I think that the trouble which has resulted as a consequence of this decision that I have been criticizing here on the part of railroad management is the kind of risk that ought to be taken into account in fixing the proper rate of return for an industry, or whether the compensation should be on the basis of the risk involved in the competition from buses, trucks, private cars, and airplanes and other competing transportation facilities. Well, how is anybody going to appraise that risk without giving full consideration to what the management has done with those risks that the companies face? You ask if I am going to have the regulatory body substitute its own judgment for that of the management. No, no, but it has to see what the management has done, and what the result of that has been. This management has done certain things, faced certain risks, and there was a certain return, they were making 12 per cent on their money. Here is a management which may be making 45 per cent on their money. I know that if there is any business in which men can engage and make 45 per cent on their money, there would be such a rush into that business there would not be any money to make in a short while. There is no such business, because capital would compete.

Now, what I say is, what the Commission is to give consideration to is: "What return does an industry make which faces a certain kind of risk"; then plot all of those on the scale; and if on this scale of risks this business falls here or there on the scale, then the returns of the business fall there. You weigh all the risks of business. You can't pick out three of these, say, three substantial risks of the natural gas pipeline business. Let us say we have an earthquake in the St. Louis area. I don't know how near that got to your pipeline; but certainly, if there was any indication that there was, generally speaking, an earthquake area around there that might destroy your pipeline, that is, break your pipeline once every year, you should be compensated for that risk one way or the other, whether that is effected by way of compensation or in the operating expenses.

1746 You ask if I mean to say that I don't know what risks confront defendants. I thought I made a pretty good evaluation of it. I merely said I did not know about this recent earthquake. I did not investigate how close this recent earthquake got to your property. No I did not say that earthquakes are the only things that break up pipelines. You ask if I think there are any other factors that might result in the parting of that pipeline between here and the Panhandle area of Texas that ought to be compensated for in the rate of return. Either in the rate of return or more normally in the utility industry, if they are normally recurring in more or less large intervals, in the operating expenses. Utility companies have to face that problem. For instance, the telephone industry in certain areas of this country is faced with sleet storm damage which periodically will knock down a large part of their lines. Well, usually the Commission says, "We will fix your rate today, and the sleet storm damages may be amortized over a period of years"; which seems reasonable when and if they occur at more or less regular intervals.

When your company had a break in the line almost two years ago now, the cost of rebuilding that line was paid for by the company; and some part of it got into the operating expense. If there is some of it allowed in the operating expense, then you are not entitled to it over again in the rate of return. If there is any such factor which deserves compensation, of course, the Commission will give it whatever consideration it deserves. Commissions have to face that problem over and over again, and they do what is adequate and reasonable and right to do under the circumstances in the case

You call attention to my testimony at page 8039 of the record reading: "One of the continuing risks that faces industries other than the utility industry is the conversion of cash into inventory." You ask if that is the kind of risk which I think regulatory bodies must take into account in arriving at a proper rate of return. If they are looking at the return earned by companies which face that risk to an important extent, of course they must discount the fact that this company does not face such a risk. You then call my attention to my testimony in the same connection that: "The size of inventories varies with the industry and with the company but in general constitutes a major portion of the invested capital of an industrial company." You ask if I am talking about dry goods stores and clothing stores when I make that statement. I mean steel companies, copper companies, the automobile industry. I didn't say inventories constitute their main fixed investment. I said a major portion. It may run anywhere from 25 to 75 per cent, or maybe 90 per cent, of their entire capital. I mean all of the inventories: raw materials, supplies in process, finished products. By inventories as I use that term here I mean merchandise, goods of all kinds, goods which have to be sold, those which the particular industry is selling or using.

I am assuming here that there is not to the same extent such a hazard confronting these pipelines when I say they are not confronted with that risk. They are not confronted with it to anything like the same extent. You ask to what extent I would say that they are confronted with that risk. Well, they have some problems in their materials and supplies that they are required to purchase. These particular companies are also in the gasoline business; they have been storing gasoline over a period of years to a certain

greater or lesser extent. As the size of that inventory
1747 goes up you take on more of that kind of risk; as it
goes down you take less. On the whole, however, the amount that you have in inventory is a very small proportion of their entire investment; whereas industry in general, particularly those industries which are making substantially larger returns than six per cent, are industries which have large amounts invested in inventories.

You ask what the ordinary merchant or manufacturer does with his inventory when he finds himself with more goods on his hands than he can sell for the moment. He must have an inventory to stay in business. A man can't stay in business without inventory. Now, the inventory of the average concern, even a manufacturing concern, consists of raw material, supplies, merchandise in process of manufacture, finished material, and finally, let us say, packaged goods.

Now, he has to accumulate that inventory in varying proportions in order to meet the day by day demand. That is a risk. If the price of his raw material falls, he can't sell at the cost of production to him; or certainly not the cost of production that he counted on. If it rises he can make a good sized profit.

When you look at the returns made by the manufacturing industry, you must take into consideration that part of those profits were made because they took this risk. I read here recently of a company in the jute business that made more profit from their inventory on account of the rise in price due to the war scare than they made in six years. Now, that was a risk to the man who bought that jute inventory from them, who wanted to stay in the business and was afraid he would not get a substantial supply.

The scrap industry, which is a major part of the steel and iron business, faced the same situation. The prices of scrap rose very rapidly. They have started to slump off now. The man in the steel business had to make up his mind: Will I buy scrap at today's quotations for my future supply; or will I gamble that I will be able to buy it cheaper a few months from now? The man who bought at the top of the peak will have smaller profits than the man who did not buy at the top of the peak. You must take that into consideration when you look at the returns of a particular steel company. What risks did they take?

You ask what defendants have to sell. They sell natural gas. They get it from the ground, and they have wells that they have drilled in order to give them a supply sufficient to meet the demand at the Chicago end, or at the Joliet end, of the pipeline. You ask when they got it. Some leaseholds were bought rather recently. Most of them were purchased or acquired in 1931 pursuant to an earlier contract. Some have been bought subsequently in order to round out their holdings and get them in the shape they wanted them. You ask if I don't think that natural gas which they bought there in a reservoir and have owned for the last eight or nine years is a considerable inventory of what defendants have to sell. No, not when you are not faced with a fluctuating market. If the price of that gas were determined by factors beyond your control, then it would be a risk, but if the price of the gas is subject only to the operations of a regulatory body, then you are going to make a fair return on the fair value of your investment and there is no risk.

1748 You ask about the thousands of owners who have an interest in that same reservoir who are working on the same aggregate inventory down there. There would be a risk if a man owned a leasehold and had to pay a rental on it and had no way of getting his gas out of there and selling it. You ask about the situation of the man who is taking as much gas as he can, but he can only take a small part of that which he has. After all, if he is taking out all he can, that is all he owns in the reservoir. He bought what was down there on the possibility that he could take it out. You ask if he didn't buy a certain quantity of gas down there when he bought the leases under which that gas is located, and if he isn't confronted with a risk as to whether or not he is going to be able to produce that gas and sell it, or whether somebody is going to do it before he can get around to it. I think in the natural gas industry, where the field is such that gas can be readily tapped away from one lease to another, that if an operator is in position where he is unable to get all that he might get, that all he owns is what he can get; the other belongs to the other man who can get it. Now, my experience in the natural gas field, I have known places—oil, rather, which is similar to natural gas—I have known men to drill wells very close together in order to get it out as rapidly as possible, because they own all that they can get out of the field, and not one gallon more. You don't own one cubic foot of gas more in that reservoir than what you can get out. You own what you can get out.

You ask whether that is my conception of what the law is down in Texas. That is my conception of the economics of that business. The law is something that I can't tell you anything about. I am not a lawyer. How much you can get out depends on how many more are down there getting it out and at what rate they are getting it out. You ask if, when you go down and spend $15,000,000 for gas reserves, you are not taking a long chance as to how much of the gas you are going to be able to take out of the field. I presume you are weighing the chances that you take; that what you do say is that you can get enough gas out of that field not only for your $15,000,000, but for everything else you have to spend in order to get that gas out; and the amount that you have to get for that $15,000,000 is the amount you are going to get out. It is more or less an industry which probably cannot be evaluated to the cubic foot or to the dollar; but you know within certain limits how much gas you are going to get out. If you don't know, I don't think you have a right to risk $60,000,000 in getting that gas out.

You ask if anyone in 1926 could at that time have predicted with any reasonable certainty as to the rate at which gas would be taken out between that year and 1936. They could not. Nobody knew at that time how many pipelines would be built, how many gas wells would be drilled, how many carbon black plants would be erected, how many gasoline stripping plants would be erected, how many oil wells would be drilled, how much gas would be used in the production of oil. You ask if that same uncertainty isn't confronting the owners of gas reserves down in the Panhandle today. I am not saying that there is no uncertainty. I am not saying that there is no risk. I am merely trying to get that leveled off to some kind of a measure, on some kind of a measuring stick. The question is: How much uncertainty, how much risk is there? Now I presume that in the figures I have dealt with here that the company says: "Here is an amount of gas, and we have a reasonable and safe expectancy of getting it out of the ground."

I presume they said that. You ask if that is what
1749 they said in their testimony or through their witnesses. I did read some place that you said there was a minimum and a maximum. I don't know whether you said minimum as much as you said maximum; but I would say that from the way I look at this picture and from what I know about this business, I think that there is a

reasonably safe figure to use; that that is what you are going to get out of this proposition.

I appraised that risk in arriving at my 6 per cent return and considered it carefully. You ask what elements of that particular risk I took into account and analyzed. Well, the risk that originally you put in this amount of money, which I looked up at that time; and what has happened to that investment in leaseholds since then; what returns you have made since then; what your future outlook is as set forth in Company Exhibit 141 and other exhibits; and from the fact that these figures that have been presented, there is a reasonable expectancy of what the company can do; and that on that basis how much risk does the company take?

Now, of course, you are probably taking the risk that somebody might get down there and do "wild catting," and drill this field wide open, and be able to get around the regulations of the Texas Commission that regulates the natural gas industry, and strip it down very rapidly; but I think that is a comparatively small risk. You ask why I think that. Because the conservation efforts of the Texas Commission have been such that they have begun to hold down this particular project; and primarily the fact that your witness admitted that there would be natural gas which you would get out until 1954. I think your witnesses testified to that effect. You ask if they did not say that there was a certain quantity of gas down there, and if certain contingencies, which they enumerated, which might operate to reduce the quantity of gas which could be recovered did not take place, that as a maximum length of time it might last until the year 1954. I think that your witnesses should have gone one step further and said that the minimum should be so much. I think the maximum was pretty close to the minimum, as I remember the testimony. I did not read it word for word. I think he was willing to state that you could get this much revenue out until 1954 on this proposition. I forget which witness testified to that. I read quite a number of them right together. I forget his name.

You ask if I am sure that any witness said that. That is the impression that I got out of his testimony. You ask if I appraise that risk as to the quantity you will get out of the field in the light of that impression. I appraise the risk this way: That if the Commission ultimately decides that 1954 is a reasonable expectancy of life of this proposition, and if they have given you a reasonable value on the gas you are going to get out between now and 1954; in the light of those two judgments there is not very great risk left.

I know that oil wells are being spotted all over that field down there, particularly in the east end. I know that every oil well drilled wastes a lot of gas and uses a lot of gas. I have also been told that there is a pretty good working arrangement in that field between the companies exploiting that field. There must be an increased number of oil wells being drilled. Every time an oil well is drilled, that gas reservoir is tapped and more gas is produced. No one can determine at this time exactly how many oil wells will be drilled down there next year or in future years; but geologists have estimated the life of fields. In my experi-
1750 ence, if they are real good competent geologists, they
are usually low. I presume that is a matter for you to substantiate before the Commission. And after all the testimony is in and the Commission has decided that there is so much gas that you are going to get out of the ground, and what the value of that gas is in the ground, which you are going to get out after so many years, and what is the reasonable length of time for you to take to amortize it over the life of the property; then if they appraise that, there is not a very large risk for you to be compensated for. You ask if that doesn't depend on whether or not the rate of withdrawal actually proves to be as they determine after doing the very best they can about it in the light of a possible or probable different history of that field in the future. I would say this: That if the Commission were inclined to view all of your evidence and the evidence of Mr. Brown and decide that the life of this field is going to be 35 years, instead of 16 years that you claim, then there is a bigger risk attached to your business than if they found it was going to be 16 years. You ask if I mean to say that there would be a bigger risk in following Mr. Claude Brown's testimony than that of Mr. Peterson and the other geologists who have testified. Not risk in following the testimony; but every year you put it further away, the bigger the risk; just the same as if you bought a 35-year bond there is a bigger risk than if you bought a 30-year bond—five years longer risk; the limit of the risk goes further. When you appraise that risk you have to take into consideration the length of time. You say that 1954 is going to end it; you are done.

You ask was it necessary to testify that it won't last that long in order to have a risk injected as to whether it will last that long. That question relies on the risk, not that this will have a longer life. You ask if the carbon black industry doubles its activities in that field and commences to take a billion and a half instead of seven or eight hundred million cubic feet a day, what effect that would have on the life of the field. That would shorten the life of the field as against the original estimate. If you want to ask me that question, my answer must be: What did your witnesses take into consideration? How did they evaluate all of these factors? Now, they certainly did not sit down and say we are going to stop at this certain particular point, and everything is through. I presume that what they have got is the point at which their evidence reduces the risk to a minimum, where there is at least a certain reasonable expectancy of getting this much out of the project. Otherwise, why didn't they come in and say 1950 or 1946? I presume the reason they came in is, that they said—we can substantiate this thing—that it will last such a length of time. I presume the reason they picked 1954 is that there is at least a safe and reasonable expectancy that this business should last that long;—and if a witness testifies it will not last that long, he will not stand up under cross-examination.

That works both ways. This property may last longer than 1954 or less long. I say on the basis of the evidence that is in here, as I have been able to interpret it, which I find in the record presented by your witnesses, that it will last until 1954 and produce a minimum amount of gas; that the testimony gives a reasonable standard that your property will last that long and will produce 164 millions of revenue in that time.

You ask how investors in dealing with the securities of these pipelines would view that matter, that is, if they would be willing to trust their money in bonds that would extend until the end of 1954 merely because any commission in the exercise of its best judgment thought the
1751 field would last that long. I think that they would be much more willing to follow the findings of the Federal Power Commission than they would of some company geologist who said it would last a certain length of time. I think one of the reasons why the natural gas and oil industry is in bad with the public as far as public financing is concerned is because of the extravagant valuation of the

leases, the extravagant estimates of reserves which are about to be exploited, the extravagant estimates of the amount of gas which can be recovered. If you give the people a sound, sane, reasonable judgment on all those factors, you are reducing their risk. I think that if the investor should find that the Federal Power Commission in deciding this case, if it found that this property is going to last 16 years, he would say, "Now, I think that is a pretty safe place for my money"; especially if you read some of the other prospectuses, that have 25 years of life ~~in them. There are bond issues of natural gas companies~~ that are in part exploiting this very field which have gone beyond 1954. I think if the estimate was 25 years and we have a bond issue for 15 years, he would be more willing to take the risk. Naturally, if the risk is longer, he is willing to put his money in for a shorter period. He will reason it is a safer risk. He will say: "All right, if you say that property will last 25 years, I will loan money up to 15 years. Ten years from now I might loan you money for another ten years."

You are not going to get a bond buyer to loan you at 3¼ per cent for a period up to 1954, but you can at 3¼ per cent on bonds that run that much shorter. You ask if he would take bonds over the whole period to 1954 at 4 per cent. You can get to a point where he would do it. You ask where I would get to that point. I will give you an answer on that tomorrow. Give me a chance to think that over. I must take into consideration quite a number of factors. Of course he is not going to advance his money on bonds running clear over the indicated life of the field at the same yield that he would if he is leaving himself a margin of ten years in there. I said he would find the yield so much. He would take it. Whether you call it bond, stock, or promissory note, the piece of paper isn't going to make any difference. For a certain amount of money you can get people to give you almost anything today. You ask if that is because I think the representations or predictions as to the life of the field that are promulgated in connection with these bond issues are often extravagant. I said that was one of the reasons why investors have disliked buying oil and gas securities. In this particular case I feel the Commission, having a thorough airing of all the factors applying to the life of this field and complete information on the life of the field, and also having complete information on the value of the property, are going to fix those two things. Now, as they fix those two things, if they fix them at a place where the life of the field is of reasonably sound expectancy, they have reduced your risk to that point.

I had to make a certain assumption. I had to make the assumption I was testifying on rate of return that was going to be on the basis that your property was being valued by the Commission, that its amortization was being fixed by the Commission, that its life was being fixed by the Commission, they would have everything else, and after they got all of those things settled in their mind, and, justly, because otherwise you are entitled to relief in the courts, on the fixing of the rate of return, at that time, I say, there isn't very much substantial risk.

1752 You ask if there is not the risk left there that, by reason of an increase in production from the field by parties competing for that production, it might not run as long as is now indicated to the Federal Power Commission from the evidence before it, even though it does the best it can to arrive at the probable life of the field. The answer to your question must be yes, because you are assuming that there must be some additional risk. Of course, there might be some slight additional risk, but I say after the Federal Power Commission has gone through all of the evidence in this case and has reached a sound decision, one which will be corroborated by the courts, as to the life of this field, that by that very process you have 16 years to go and you are going to get 164 million dollars. I presume they are not going to decide it will last for 16 years if there is not gas enough to last that long. You ask whether they can know that. Aren't you giving them all the evidence that bears upon those factors? Aren't they assigning their own experts to find out all the evidence?

You ask if there isn't always the danger and the hazard that, by reason of increased cost of production or formation conditions that will put wells out of commission after it is too late for them economically to drill other wells, and on account of increased production of gas by those who are competing, namely the oil producers, other pipelines, and the carbon black industry, you won't have enough gas to last out the length of time the Federal Power Commission, in its wisdom and exercise of the very best judgment it has, believes now the field might last. It may be some slight risk on that account. I think it is a slight risk. If it is not, let's have some information. I am assuming you have all the information in the record on which the Commission is to fix the life of the field. I am assuming they are going to fix the reasonably sound life of the field. They are not going to arbitrarily say 40 years or 25 years, when the evidence shows the reasonably sound life of the field is 16 years.

If the reasonably sound life of the field is 10 years, I presume the Federal Power Commission is going to fix 10 years and you are going to have amortization for ten years, and having fixed the reasonably sound life of the field the risk left is negligible. I have made whatever compensation I thought that risk was entitled to in the rate of return which I have expressed here in my judgment as the proper one. You ask how much compensation I allowed for that risk. I didn't evaluate just that way, by taking each factor of risk separately. I regarded that risk as of small though not negligible consequence. I didn't say the weight I gave it was negligible. I said the amount of risk, I think, is negligible. I wasn't holding you to a minimum of 6 per cent return. I think that is a very liberal return. I have plenty of leeway in my return. Yes, I think I am giving a liberal return when I say 6 per cent. I have given predominant weight to the fact that there is a war on and I didn't know what investors were going to get.

(December 6, 1939.)

You ask if in my direct testimony I did not undertake
to distinguish between the risk surrounding an industry
and the continuous risking of money by the companies in
the industries, which, for the purpose of the succeeding
questions, we will abbreviate as external and internal risks.
That is a satisfactory distinction to me, of course, if it is
understood by external risks we mean conditions surround-
ing an industry and by internal risks we mean risks
1753 arising out of the business process itself, a process
whereby a business makes or loses money. My statement was in brief that those within the business, arising out of the transactions of the company under consideration, are the important ones as compared with the risks surrounding an industry. I said later that those surrounding the industry are slower and can be met over a period of years. That is not true of all industries. It is a generalized statement.

You ask me to give you an illustration of what I mean.

Well, I mean by that statement the gradual replacement of a product by a substitute product. Let us take; for example, one that might be operating at the present time —I don't know how large it is—but the gradual replacement of silks by the new fabrics being developed by the chemists. That does not happen all of a sudden. That is a slow process. The management in the silk business sees it coming and can make to a certain extent provision for it.

Another type would be in the extractive industries; the gradual depletion of a certain ore; not the particular ore body of one company, but a whole field of operations, which ultimately means that business in that section is going to be removed.

I am thinking now of certain of the coal fields in the Pennsylvania neighborhood; for example, around Rich Hill, Pennsylvania; once a flourishing community in the coal field; with merchants doing business in that town, railroads operating to that town. Gradually, as all of the mines in that neighborhood became depleted, all the industry moved away, and today there is nothing but ramshackle buildings left to gradual destruction.

That did not happen all of a sudden. People operating that property saw it coming and made provision for it. Your own company will face that risk, and make provision for it by setting up adequate depletion; by, towards the end of the property, not maintaining your properties to the full extent as if they were going to run forever; and take other precautions.

Now, this kind of external risk, as you use the term, operates slower. They are not like fluctuations in the market price of raw materials, which affects the sales price of your commodity in the immediate future.

You suggest that we apply this principle and doctrine to the traction industry and ask whether the risk surrounding that industry was overcome over the years or whether it finally submerged the industry in a great many places. Well, it was seen coming over a period of years. Ultimately, of course, the industry goes out of business, whether it is the individual company or the entire industry. It takes a long period of time. During that period of time provision can be made. Certain street car lines were compelled gradually to change over to a bus operation.

The Evanston Street Railway, for example, operating under the jurisdiction of the Illinois Commerce Commission, because they had the foresight and prudence, were able to pay all of their bondholders one hundred cents on the dollar; and their stockholders still have for the money that was not returned through liquidating dividends a good going business, returning excellent dividends in my opinion.

1754 Now, the fact that some people in the traction industry have been pigheaded about trying to run a street railway in a small town where it is uneconomical, and where the bus operation is much more economical, and have allowed somebody else to take over that bus operation, does not change the fact that it is a slower risk than the ordinary risks of a man in the steel business or the automobile business, or any other regular business, non-utility; and that to a certain extent it can be overcome. Whether it is or not, of course, has nothing to do with my application of that principle. The fact that management may be pigheaded and refuse to recognize obsolescence and depreciation—

You ask what is the attitude of investors toward putting their money into a business like a traction company as that industry has been situated since the advent of the bus and automobile. Well, there is a security market where shares and bonds are being sold—at discounted prices, it is true; and if some investors feel that the present prices are too high, they sell. If others feel that the present prices are too low, they buy. You ask whether it has reacted to increase yields on the investments of those who are willing to put their money into that kind of business under the circumstances which confront that industry. I think there are speculative profits to be made in the industry. They are speculative, of course, and therefore, if the profit comes, it will be large. Most of the people will take losses. For that reason, those who put their money in require high yields. That is true of every industry which has facing it its ultimate extinction by competition or by the exhaustion of physical resources.

You ask if an industry is confronted with a short life which can not be definitely determined in advance, whether investors take account of that circumstance in the yield demanded for investing in the securities of that kind of business. They will take account of that in two ways: First, by seeing the amount of depreciation, depletion, and amortization which it sets aside; and then, if that is not sufficient, by yield. But if, in their opinion, the depreciation, depletion, and amortization is enough to restore to them their capital before the end of the project, then they will not require any additional yield.

A bondholder who is getting, let us say, a yield of 3½ per cent, would want more safety than a stockholder who is getting 6 per cent. You ask how long before the expiration of the uncertain terminable life would he want to get his capital back into his pocket. As soon as he can get it, naturally. But I think that where an investor would sit down and say, here is an uncertain life; the company is setting aside such and such amount for depreciation; he would then try to make up his opinion on what that life would be. If he thought that there was a good chance that it would run beyond what the depreciation and amortization called for, he might then be willing to take a comparatively small return on the gamble.

If there was a reasonable expectancy that the company was not setting aside enough, he would want a big return, or he would want to buy his securities at a liberal discount.

You ask if in the case of a natural gas company it isn't also possible that the life of the source of supply will be exhausted prior to the time indicated as of any particular time when we are still looking into the
1755 future. It is always possible that it will be shorter
than the estimate, unless that estimate is unreasonably short; or longer than the estimate, unless that estimate is unreasonably long.

In my experience in Kane, Pennsylvania, where they dug some wells which were drilled in the 90's, and allowed to run to air—gas wells allowed to run to air for a period of years, then turned into the lines serving Kane, Pennsylvania; they are still producing gas. They are pumped on a vacuum, but they are still producing gas. They have a very tight sand. Now, every geologist, as far as the records show to that time, that made any estimate of the life of that field, was low. It all depends on your estimate. If your estimate is extravagant, there is a big risk if you are going to follow that estimate.

Questions by the Examiner.

You ask whether, when I refer to Kane, Pennsylvania, that is a typical case in my estimation and whether I find estimates always low, so low that there is no possibility of the extinction of the field. No, the possibility of being high or low depends on two things: No. 1, the kind of estimate that is made; and, No. 2, the gradual change that is made in investigating your estimate. Just because an estimate is made today that this field will last so-and-so many years does not mean that there is a risk if it happens to run out in a year in advance. The very fact, as Mr. Morgan referred to yesterday, of additional people drawing from there, is known to the management when that happens, and you have a period of time to adjust for it. It does not necessarily mean that if the source of supply goes out in 15 years instead of 16 years, that the company is bound to make a loss. Of course, there is always a possibility that an estimate is too high or too low, if it is an honest estimate.

Cross-Examination by Mr. Morgan Resumed.

You ask whether any investor dealing with the securities of a natural gas company whose source of supply was the Panhandle field wouldn't be confronted with a risk that, for some reason which we cannot foresee now, it might run only 12 or 14 years instead of 16 years. I think an investor faced with a decision of the Federal Power Commission, founded on a complete study of the facts—company evidence and Commission evidence—would be more inclined to look upon the possibility that that field would last beyond that life than he would to look at the risk that the field would not last as long as the Federal Power Commission said it would.

You ask on what basis would he figure that it might last longer than now indicated. On the basis that the balance of the factors that are in play center around the period that the Federal Power Commission actually chose; that they probably were reasonably conservative in their opinion; that, therefore, there should be at least as many chances for the field to last longer as there are for the field to last shorter, and if the Federal Power Commission renders their decision, I think that that will be true.

Therefore, since most estimates to which a Commission would give weight are founded on what is known to be there, and there is always the possibility that there is more there than is known to be there, I think that most investors would be inclined to consider that there was at least an attractive speculation in the proposition that it would last longer than the Federal Power Commission has said.

1756 You suggest that we assume that the amount that is there can be definitely ascertained and that that is the amount that the Federal Power Commission finds to be there, and then ask if there isn't still a chance that it wouldn't last as long as it now looks like it might, in the light of what they had before them concerning those who were taking gas from the field. If you are merely stressing the point that there might be such a possibility, the answer is yes. That possibility is a risk. There is also a chance, but how much of a chance; how much of a possibility. What are the factors on the other side of that possibility? You ask how many pipelines have been built out of that field in the last 16 years. I think I have a recollection of five. I think that is all. There might be nine major pipelines and a lot of little ones that have been built from that field and a lot of smaller ones. I do not know how many carbon black plants have been built during the last 16 years. I do not know how many gas stripping plants have been built there during the last 16 years. I do not know how many oil wells have been drilled there in the last 16 years. I do not know how much gas has been produced in connection with the production of oil in the last 16 years.

You ask if I think the Federal Power Commission or any other human agency looking at that picture 16 years ago could have foreseen the total volume of gas that is now being taken out an that has been taken out during that 16-year period. I know that the Illinois Commerce Commission in 1933 had this very situation before it and reached a decision at that time on the life of the field, and on the basis of their decision the investor now finds that the life of the field is longer, in spite of all these things that have happened in the intervening period. If by your question you mean that they could have set down exactly the figures which happened and actually did happen, the answer of course is no, but if you mean by that

that a commission with all the then known facts before it could have given a decision which would have rendered substantial justice to the company, the answer is yes, and I think commissions will. Otherwise, you are substantially saying that regulation of natural gas companies is an impossibility.

I have no intention of denying that there is a possibility that the field will not last as long as the regulatory body thinks now it will last, after doing the best it can to get at the facts. I imagine that now there is a great deal more known about that field than there was in 1933 as to its extent and as to its productivity.

1757 A great many wells have been drilled around the field from which they have determined rather definitely the extent of the field. I am aware that wells have been drilled over the area to the extent that they have located unproducing areas within the outside limits of the field. You ask how many dry holes have been drilled within the outside limits of that field. I have a record of what defendants have produced and that is all. I know of one area within the field that is definitely known to be unproductive for some formational reason. That is in the eastern end of the field, and it is shaped horseshoe on the top and straight line across the bottom, substantially. I think that is over near the middle of Gray County. I have made no investigation as to the geology of this field, as to its resources, its life, or any of those things.

As I recollect it, Mr. Morgan was directing a question to me as to the possibility of a commission on the basis of facts now known reaching an estimate which would, or at least to the required legal extent, remove the risk from the investor, and I said that the Illinois Commerce Commission in 1933, when much less was known about this field than is known today, reached an answer, and that answer turned out to be low, showing that they did not step out and pick a period for the field so far in advance that the investor was put to an undue risk. I know that a great deal more is known about the extent of the field, the productivity of the different portions of the field, and the unproductive portions than was known in 1933. Therefore, there is more data from which to estimate the content of that field than was there in 1933. If you are directing your question to the exactitude with which a commission can determine the life of the field, then, of course, there is always a chance that they will be wrong, but I, as I think I stated yesterday, made the assumption that the Commission and the Examiner in weighing the evidence, which I have not weighed, will reach a life of the field which will put no new risk upon the investor. I think that is presupposed in this whole process. You ask what it is that is going to determine how long the field lasts if we know how much gas is there and know it definitely. To practically the largest extent, the maximum, the most important factor would be the rate of withdrawal; and the economic level to which it could be produced is another factor that would enter into it; and how much of that gas can be gotten out without causing trouble, without bringing in water.

The operators are not going to take it out any longer than they can do it profitably. They are going to try to make the greatest amount out of this natural resource that they can. I will accept as a fact on which to predicate my future answers the statement that the oil operations in that field are still in a process of development; that additional oil wells are being drilled down there from time to time. I do not know now, and no other human being can predict, how many oil wells are going to be drilled in that area in the next sixteen years before that gas is exhausted. Unless you know those things, even though you know how much gas is there, you cannot know whether it is going to last as long or as short as would be indicated by the present rate of withdrawal. Of course, I am perfectly willing to admit that any statement based on any set of factors might be one which would result in placing too long a life on this property or too short a life on this property. I insist that any investor, and I, in putting myself in the place of deciding how much an investor should earn, am working on the assumption that the balance of all of the factors which deal with the life of the field will be so weighed by the Com-
mission that there is at least just as much chance
1758 that the field will last longer as there is that it will
last shorter.

I think that a group of investors looking at the same proposition would reach different results. One would be inclined to say that the life of the field is longer than the one indicated and buy at a level. Another would say that the life of the field may not be that long and would refuse to put his money in at that price. But I do not think that we have a right to assume in discussing the rate of return that this company is to be entitled to earn, to assume that there is a large substantial risk from this factor. I have not assumed that there is any large substantial risk in arriving at the result I stated in my direct testimony. I have taken into consideration the fact that there is some risk in this business.

I know that some years ago two pipelines were built from the field down in Indiana to Chicago. I know very little about the situation. I know that there was a pipeline which the Peoples Gas Light and Coke Company guaranteed a bond issue for and ultimately had to pay on the guarantee. I am not acquainted with the exact nature. I have in the course of discussion with certain people been informed that the venture was not a loss, that it was substantially profitable, although it looked like a loss, due to the fact that at the end of the proposition the Peoples Gas Light and Coke Company was called upon to pay a very substantial amount of money to relieve themselves of the commitment they had undertaken when they had guaranteed the bonds. I don't know whether there was a profit in that transaction or not. I was given to understand the savings which Peoples Gas Light and Coke Company made during a certain period of their operation were sufficient to counter-balance any loss ultimately sustained. I have made no investigation of the subject. It is a matter of past history except in so far as Peoples Gas Light and Coke Company were called upon to pay off the guarantee. I was merely trying to give a general picture of what I knew about this proposition. I don't think there is any conclusion to be drawn from anything I have said. I do not know whether or not other large investments besides the pipeline investment were made in and around that Indiana field on the strength of the presence of that gas. I do not know that gas was being produced in large quantities. I don't know the length of time before the supply in that field was completely exhausted. I do know that it was far short of the contemplated life of the field as of the time the pipeline was built as indicated by the maturity of the bonds, but I have no knowledge as to whether the term of the bonds was a reasonable one or whether it was simply a "by-guess and by-gosh" venture in which some people were able or were going to make money by selling the bonds and ultimately palming them off on Peoples Gas Light and Coke Company through a guarantee. You can't prove from me that a lot of developments were made down there and the field was promptly exhausted.

You ask if I know anything about the Tioga field in New York. I know gas wells were brought in a few years ago, 1935, I believe, and for a while there was some rather rampant speculation in the field. All of this died down to a considerable extent. I do not know of a pipeline that the Cabot interests built to their plant up at Rochester, New York to convey gas for industrial purposes. I do not know that right now the field has been exhausted to the point where the withdrawal of gas must be restricted in the immediate future. I do know that gas fields are inevitably exhausted sooner or later, and that anyone who deals with natural gas pipeline securities must know that ultimately the gas which is being transported over that line, the source of that gas,
1759 will be exhausted. I do not know that that is a circumstance that the Commissions and courts in general regard as constituting a special risk from the standpoint of those who invest in properties that are dependent upon natural gas supply. I think on the contrary that is to be given effect to in setting the depreciation and amortization charge.

You ask if I have read the cases dealing with that subject. I am no lawyer. To a certain extent I keep abreast of what the courts have said about this risk, a sufficient extent for an accountant. I probably have not read the case of *Wichita Gas Company* v. *Public Service Commission of Kansas*, 2 Fed. Supp. 792; confirmed in 298 U. S. 561. You have read to me from the opinion of Judges McDermott and Phillips in that case as follows:

"The pipeline company is subject to the hazards attendant upon the production of gas, and its transportation to distant markets. The amount of gas it may take from its own wells, and the price it may charge for its product, is subject to regulation by public authority. It must find a market in a highly competitive field. It competes with coal and fuel oil in household heating and for industrial purposes; the competition of fuel oil is particularly formidable for household heating; improved oil burners are automatic, approved by the National Board of Fire Underwriters for safety, are as clean as gas, and dependable. Electricity has absorbed the household lighting and is making serious inroads on cooking. In short, it must search for and find its gas; transport it hundreds of miles without an hour's interruption; then find and satisfy its customers."

You ask if I agree that that is a correct appraisal of the risk involved in the natural gas pipeline business. I think it is a rather flowery description of the difficulties in natural gas pipeline business and I would certainly, giving it all the weight the court seems to have given it in there, still say that it is a very small risk compared to the risk in the ordinary competitive enterprise not subject to regulation, such as steel, automobiles, anything that you choose to take.

It is my opinion that a man who is confronted with the decision of whether he will buy his raw materials now or contract for them now at a fixed price and take his chance on the trend of the prices on the things which he makes out of the raw material, is confronted with greater risk than the man who puts his money into a pipeline extending 950 miles across the country, to engage in the production from a field in Texas of natural gas and transporting it through that pipeline to a market 950 miles away. If it turned out that the prices are lower than anticipated by the manufacturer he can give up a part of his return and protect himself against the risk. A great many manufacturers manufacture only on order and sell through jobbers who then take the risk and would have to get a part of the return. That is his option, to buy on a long-term contract basis or to buy on the market his raw materials; and he has the further option he can sell the basic raw material short on the market for repurchase as of the date of sale. You ask if that is the kind of option open to a pipeline company. The money in the pipeline is risked once and for all. These risks in the ordinary business keep on day after day. A man might be making a nice profit in January, February and March and then make a loss. It affects a larger portion of his capital. It works continually and rapidly. The risk of investing in the pipeline is substantially the same risk that a manufacturer undertakes in his investment in plant and machinery
1760 and his fixed assets. It is a different kind of risk.

You ask if I mean that the risk involved in the pipeline business is taken when the pipeline is built and that there isn't any risk after that. There is a risk for the capital over a long period of years with a part of the capital coming back each year. The fixed charges run right along through the years. You ask if there is anything he can do about it after he puts his money into the pipeline, such as the election of the manufacturer to buy his raw materials on the market from month to month or day to day, rather than take the chance of contracting for a long period of time. He can get certain underwriting agreements. I think he can relieve himself of part of the risk. No, he can't get out of the pipeline business after he gets into regulation. He can't shut his pipeline down like I have said these factories may be shut down at times, and for that particular reason he is entitled to a fair return on the fair value of his property. You ask if he is not entitled to make it if he can get it, under regulation. There are some possibilities of not being able to get a fair return on the fair value of the property, but I think for the present we ought to assume the indutsry that is being regulated can earn a fair rturn on the fair value of its property. You ask where defendants would be if their revenues be reduced by $3,000,000 and we have another year like 1938 coming up in 1940. My answer is I don't know. You ask if defendants revenues were not $1,000,000 less in 1938 than in 1937. They were less. I don't remember the exact figures. I could look it up if it is important. Yes, I said that the experience of the Natural Gas Pipeline Company has shown the pressure of this type of risk, that is the risk of varying demand, but it takes a microscopic examination to find its effect in the profit and loss account. I then went on to say "Its sales to industry during 1938 fell off substantially from the peak in 1937 but the effect on profits was hardly noticeable and could be determined only with a very detailed study." Yes, I was talking about the varying demand for natural gas in that statement. You ask what the figures were as between 1937 and 1938 according to those records. I don't think I want to answer that question because what I had in mind was the correct profit and loss.

I have had some men abstracting the records of Natural Gas Pipeline Company of America in order to obtain information. I find it—I made several attempts to segregate the profit and loss of this company, to segregate between profit on the sale of Chicago District Pipeline Company for residential and commercial consumers and the profits from industrial sales—and I find it a very difficult undertaking, and I wasn't going to spend too much time because I didn't think there was much point in it, but in my opinion the margin of profit on these industrial sales is comparatively small, the effect is comparatively small. There are a great many adjustments that would be required in the earnings statements submitted both by members of my staff and by the company. My investigation leads me to make that statement. I still feel if we segregate the effect of the sales to industrial consumers and the profit on those sales and then compare them we still find the net return is changed very slightly.

I don't know whether you are selling gas for all the purposes you can get anybody to buy it for or not. I presume you are selling gas in order to realize the maximum amount of profit that you can realize. It is true you are not confining it to industrial purposes. It is true that there was a considerable variance between the demand for gas from your customers in 1937 and 1938 for all purposes.
1761 The greatest part of that difference was the falling
off in the taking of industrial gas as between those years. Your exhibit shows that the net earnings from operations in 1937 were $10,763,000 as against $9,884,000 in 1938, but when you are talking about actual earnings you have to make a much more detailed examination than this one. There has been no attempt made by you people or by my people to actually segregate these profits and losses, as to how they arose. You haven't made any attempt to set forth those expenses which relate to the year's business and those expenses like drilling wells, the purchase of oil, for example, for lubricating purposes, which comes sporadically. You have nothing but one year's income account in this one year. I know that these figures have been reconciled with the figures of our Mr. Woodford, who himself introduced figures pertaining to those earnings in a broad general figure presenting the general picture. You cannot use these figures to draw any conclusion as to what the exact effect was of change in demand. No, the Illinois Commerce Commission is not going to put in evidence of the character I am now referring to. If you go down below net earnings how are you going to allocate depreciation, depletion, and retirement, one of the largest

expenses you have? Certainly one of the logical bases is to allocate those expenses on the basis of cubic feet of gas being taken out of the ground and make that adjustment and see what the profit and loss account is going to look like.

In my direct testimony I said the gross shows a very substantial change, but I think the net takes a microscopic examination to find. If you want me to, I will make just that one simple computation of depreciation and depletion and put that on a cubic foot basis. You ask if they didn't have the depreciation and depletion set up on the same basis in 1937 as in 1938. Is that the basis you are going to use when we discuss profits from industrial sales and changes in demands? Certainly a much more logical basis for the determination of the effect of change in demand is to set up your depreciation and depletion on the basis of cubic feet withdrawals and not on the basis of time. That is true even though you are competing for production from your different properties with 100 or 1,000 other producers. You are going to take out so many cubic feet of gas to recoup such and such an investment. It is a perfectly logical basis. It is my view, with respect to the revenues, that it would be microscopic and would take a close analysis to determine whether any loss occurred as between the years 1938 and 1937. On page 1 of Exhibit 136, the way that page of the exhibit is developed, the net earnings before other charges are set out in line 5. The indicated difference between the years 1937 and 1938 is approximately $900,000. That difference is not attributable to varying demands as between those two years. It is attributable to quite a number of varying factors. Let us take a simple thing like purchase gas expense. Now, purchase gas expense did not vary in accordance with the sales of cubic feet of gas. Neither did your production expense. Neither did anything else. You have certain expenses in here that are regular and normal expenses, which I presume in any proceeding, in any managerial judgment, will be chargeable against your basic load customer; in this case, the residential and commercial customer. Now, then, the mere fact that you make such a large differential in the price between the sales of gas for industrial purposes and the sales of gas for residential and commercial purposes, show that you are not charging a full pro rata share of your expense against that industrial customer.

Defendants do not have any residential and commercial customers, but they sell gas for those purposes at certain rates, at wholesale. The first line shows that there is 1762 a difference of $1,100,000 in the gross income, and when the operating, maintenance, and general expenses are all paid, the difference is reduced to about $900,000. You ask to what I could attribute that falling off in net earnings from operations, except the fall in gross as a result of variance in demand. Turn to page 2, and look at your gasoline sales, that have dropped off by $225,000, as part of your gross. You ask if the quantity of gas that you had a demand for had something to do with that. Your sales of gasoline in gallons in 1938 was $27,474,000 gallons, in 1937, 24,864,000, so that you actually sold more gallons of gasoline. You ask if that ought not to have reduced the difference between the revenues for the two years on that basis. You are taking much too simple a view of cost accounting analysis. We can't say that this ought to be this and this ought to be that. It requires considerable analysis to find out. You ask if I have studied the volume of gas that we sold in 1937 as compared with what we sold in 1938, I have the statistics and have made certain studies. In 1937, as shown on page 6, it is 74,476,000 M.C.F. In 1938 it is 68,759,000; a difference of nearly six billion cubic feet, or about 8 per cent. You ask if that drop isn't attributable to this element which I have said is a risk in some businesses but not in defendants', namely, the variance in demand. I did not say that variance in demand was not a risk in defendants' business. You ask if the falling off of the gas sold of almost six billion cubic feet is not an important matter from my standpoint. It is an important matter, but the six billion cubic feet gives you no indication as to the change in profit. It would depend on how much of that six billion was your lowest priced gas and how much was your highest priced gas. I can conceive that if your highest priced gas increased and the lowest priced gas decreased, you might have a reduction in M.C.F. sales and an increase in dollars. You had a reduction in all but two types of sales; line 11, Standard Oil contract, was greater for 1938 than for 1937; and line 13, all other gas sales, was also greater for 1938 than for 1937, as shown on page 6 of Exhibit 136.

You ask me to read from line 1, page 1 of Exhibit 136, where the difference is turned to dollars. I will read it.

but I am not going to draw any conclusions on those figures. My statement was based on an examination of this situation--and I say that you cannot merely take a few figures and reach a conclusion from them; that it would take a long, detailed examination. As far as my examination shows, that variation and change in demand is not one which produces a very large change in the profit and loss account, in comparison to what the change in demand produces in an industry. I would not say that this difference of $1,100,000 in gross revenues and $900,000 in net revenues from operations was of importance until I analyzed the operating cost. I would also want the depletion, depreciation and retirements. You ask whether investors would look at the gross revenues and the gross volume as between the two years. Do you realize that you are talking about a change of nine or ten per cent at the most in variation of demand, where industries are faced with changes of forty to fifty per cent; that actually change from a nice fat profit in one year back to a fat loss in the next. The next year they may go to a fat profit again.

The ordinary industry sometimes takes advantage of a rise in the market. Sometimes it does not. If it had the opportunity to do so it would do so, but they don't always do it. I don't think that in the ordinary situation they are in position to do it. A great many merchants do not take advantage of the change in the market. There are many extensive advertising statements to that effect. A great many merchants have a base price which they point to with pride; and advertise extensively that though the
1763 price of leather has increased so and so much, we
haven't raised the price of our shoes; although the price of cotton has gone up so much, we are still selling our shirts at one dollar, and so forth. They take advantage of the increase in price when they feel it to their best advantage to do it. I cannot say that ordinarily they feel it is to their best interest to do so. Most merchants are trying to sell at a fixed price, a base price, and adhere to that price. Your shoe industry, your hat industry, and to a great extent your shirts, like Arrow shirts and Manhattan shirts, make a price. That is the price of their merchandise. They want a man to know when he comes in and asks for an Arrow shirt or a Manhattan shirt that he will pay $2 or $3. The same way with Regal shoes, Thom McAn shoes, Walkover shoes; they all want one price. Florsheim, they have a fixed price. You ask if Thom

McAn didn't raise their price the other day. I am not saying that they always adhere to that price, but they don't take advantage of these minor fluctuations. I will admit, for the sake of going on with this proceeding, that in general business does look to take advantage if they can of price changes. You ask if there is always a chance that by reason of an increase in price or the value of the thing which they are selling that they will make profits just as much out of proportion as the losses which I referred to just a moment ago. That is at least their expectancy. They hope over a period of years to make money. That is the reason they are in business. The hope of making large profits is the reason they are in business.

You ask if defendants, so far as the top price is concerned, have been limited to the prices that were fixed by their contracts. They have a contract price on what they have to sell. I don't know that it is just the fixing of a top price. The top limit of their revenues is determined in part by the prices fixed by their contracts. The quantity is another term. When there is a varying in the demand, as took place between 1937 and 1938, that cannot be made up and offset except to the extent that the restoration of the volume at the same price would tend to offset. You ask if it isn't true that if 1937 represented a maximum of their capacity, approximately, and it fell off in 1938, with the result that they lost $1,100,000 in gross revenues, they cannot hope in 1939 or some other year to get $1,100,000 over and above the revenues of 1937, because they are held down by their prices. On the assumptions you have made your conclusion is correct. You ask if they have the hazard of varying demand without the opportunity of offset by increased market price for the thing they sell. If you want to call that a hazard, yes. You ask if I think it is a hazard. I think that it should receive consideration in determining what the reasonable expected earnings of this company is going to be. Yes, I said in my direct testimony that it is a terrific hazard from the standpoint of unregulated business. Ordinary business finds a loss at the end of fluctuations and demand, not just a reduced profit. They find a change of not one million dollars or one million one; but I am quite sure I can find some large corporations where the change was 100 million dollars. You cannot make it in dollars, because it is the per cent in the change in demand, and 10 per cent is a comparatively small change in demand as compared to what is faced by ordinary industry.

You state the question is, what will the reduction 1764 be next year if the varying demand reduces it by $1,100,000 and the Federal Power Commission reduces it by $3,000,000, making a total of $4,100,000 next year. You ask when defendants can recoup that $1,100,000. In subsequent years, I assume. I did not say that defendants did not have the hazard of varying demand. I said it is small compared with the hazard of ordinary business.

Now, I would really need some more information as to what caused the reduction of $1,100,000; what the cubic feet of gas were; whether you are going to have that tacked on, at least to some extent, in the year 1954. But I presume and assume that when the Commission determines what the reasonable expected earnings are they will have before them all the information that is necessary to reach such a determination, and that if there is any great hazard of the sales falling off, they will determine that in connection with the indicated earnings. I think you are trying to confuse the weight that should be given to the dollars sales which may drop off or increase and the weight which should be given to the hazard in rate of return. Now, I am assuming that the reduction when made will be on the basis of reasonably expected earnings for the future, not any peak year the following year is going to show a much lower figure which then can never be exceeded. I have stated that industry has a severe hazard as a result of varying demand. I have conceded on cross-examination that any falling off may be more than made up by an increase in the demand and an increase in the market at a later time, and that business is looking forward to those recoupments, which may or may not come. You ask me to assume, for the purposes of this question, an industry that is regulated and whose rate of return is fixed at the rate I have fixed here of six per cent, and then next year we have another 1938 and its revenues fall off by $1,100,000, as a result of varying demand and ask if it will make six percent under those conditions. You asked me to assume that the Commission is going to take as the earnings some figure that is not indicative of the reasonably expected earnings to accrue next year and the year after that and the year after that.

I have said myself that varying demand is one of the things that confronts industry. When there is a varying demand upon the industries that you serve with fuel there is going to be a varying demand upon you.

You ask how defendants are going to recoup the losses or have the losses offset which they will sustain as a result of these variances, should they occur. I am assuming that the Commission in finding the income available for return for the future will give full consideration to all of the factors which affect the sales up and down and strike a balance of those factors at some reasonable figure; that when they reduce the income through a rate reduction that it will not be reduced to that point where any drop in demand will cause the company a loss which can never be recouped. They will fix a figure that if the demand goes up they will make a little more than six per cent; if the demand goes down, they will make a little less than six per cent. I am quite sure that if they use the figures presented in Exhibit No. 141, the company will make more than six per cent if they are allowed a six per cent return on the basis of Exhibit No. 141. Yes, if defendants fail to make six per cent during any one year they will get less than six per cent. You ask if there is not a constant possibility from year to year that they will have a repetition of conditions that will operate to reduce their revenues. Yes, there is always a possibility of all possible things. Of course if the revenue is reduced by a million dollars next year, as an illustration, as a result in the falling off of demand, there is a way to recoup that and make the 1765 average six per cent. The fact that your rates are reduced is certainly not going to hinder your chances of selling the gas. It is going to limit your top price. Your earnings will be the result of a great many factors. One important factor will be, having nothing to do with absolute demand, whether you can sell all of your gas at the top rate block instead of at one of the cheaper rates, that you will have to abandon selling some of the interruptible supply gas, because you can dispose of that gas somewhere else without any increase in cubic feet sales. You can have a very substantial increase in dollars of sales and dollars of profits. You have been talking about things that have very faint chances of happening. I am talking about things that in my mind are a strong probability.

You ask if I do not know as a matter of fact and as a matter of law that if it turns out as a result of varying demand upon defendants for natural gas by their customers that you lose a million dollars some year, and there is thereafter a new rate case, that loss cannot be taken into account and restored to defendants at another rate proceeding. I certainly made no such assumption. I am acquainted with the fact that the Illinois Commerce Commission, for example, has been treading on the toes of the utilities of this state right up to the summer of 1937 in an aggressive program of rate reduction, right when the recession started. Now, the minute the recession stopped we are not going to jump back on those companies and say, "We think you are going to make six per cent and it is an allowable rate of return." That is not the way rate regulation runs. You are not going to be deprived of every nickel above six per cent. We are going to fix reasonable rates of return, and on the basis of expected earnings give full consideration to the testimony adduced by the company and full consideration of all of the testimony this Commission will set down, and decide whether this company is making too much money, and if so, how much too much. That will be taken, under normal circumstances, into consideration. It has been my experience under regulation that the utilities by and large will make more money than is expected of them, because our experience has always been that after a rate reduction, back comes the gross and back comes the net, and in about another year, a year and a half or two years, you have got another rate reduction coming. That has been the history of rate reduction. You do make more than six per cent sometimes. Fixing a rate of return at six per cent does not freeze you down that what is lost is lost forever and there is no possibility of ever making any more than six per cent. I am quite sure you will make more than six per cent in quite a number of years, even if this Commission fixes rates at six per cent.

You ask if the difference between defendants and a utility isn't that defendants have a pipeline through which they can transport 210 million cubic feet of gas daily whereas the utility has the facilities with which to supply the demand of their customers and there is not any top limit on the amount that such customers may take if the conditions are favorable. All utilities are restricted by their capacity; generating capacity of electric utilities is an example. You ask if that is the same restriction that there is upon a pipeline 950 miles long. I do not know what leeway you have in pressures. I am perfectly willing to state that it may be that your pipeline acts somewhat more restrictively than let us say the electric industry. I do not know that it acts any more restrictively than the loop does to the transportation industry. I mean the loop in Chicago. Bottlenecks always work for restrictions. The Chicago loop is the downtown business district in the city of Chicago.

1766 If the prices at which defendants sell gas are fixed so that they will be allowed a return of six per cent based on the normal quantity of gas they handled through their pipeline, and there comes a situation such as they had in 1938 where as a result of a business recession the volume demand was so reduced that their revenues were reduced a million dollars, defendants will have a reduction in net of an undetermined amount. Under the law it cannot formally be restored; but I have not any worry that utilities will find themselves earning an absolute level return which they cannot exceed. My experience has been that utilities uniformly are making more than a fair rate of return. That is the reason we have rate cases. You ask if I have not a perfect conviction that my last statement was true and that the rates of all utilities ought to be reduced. No, but it has been my experience that utilities do make more than a fair rate of return, and therefore we have formal rate cases that drag on a year or a year and a half before we get a reduction, during which time the utilities, as has been decided by the Commission and by the courts, have been making an excessive rate of return. I am quite sure that investors generally regard the regulated industries as those from which they ask the lowest return. You ask if I don't think that any investor contemplating putting his money into the securities of these companies under the circumstance of having the price so fixed as to limit the return to a definite amount, would take into account the possibility of a recurrence of another recession such as occurred in 1938, which would reduce the earnings to a level below the rate of return fixed by the regulatory body. I can't give a categorical "No" to a question like that, that no investor would give any thought to that. Whatever fear they may have, and I doubt whether many investors would have such fears, are more than counterbalanced by the regularity of the business in the field of utilities generally and in the natural gas field as shown by your specific company. Certainly investors are not going to give very much weight to a factor like that. They are not afraid of regulated industries, that because the Commission fixes a rate of return that they will never exceed that rate of return; that a loss once made is gone forever and cannot be recouped, because that is not the way the investor generally weighs the factors and decides. Generally the investors regard the regulated industries as the best. You ask how I found that out. The yields necessary to keep stocks and bonds of utilities at par are lower than that required to keep an industrial at par or any other type. As a basis for that statement, I have in mind the stocks of electric companies, gas companies, water companies. I didn't have any one particular company in mind whose stocks are dealt with on the basis that I have just described. If your question goes to the accuracy of my statement as to whether utilities can finance at lower rates of return than other companies, I will prepare a study for that. I thought that was almost prima facie. Look at the rates utility bonds are being sold at. I didn't say that investors are demanding small yields. I said smaller than he does generally demand. That is a fact.

You ask for some illustrations where that is true of equity securities. I will prepare a statement. I do not have that kind of a statement with me. I base my statement merely on general knowledge. You ask if I can name any other than the Commonwealth Edison common stock issue that has been offered to the public in substantial quantities in the last four years. Stocks selling on stock exchanges gives a fairly good indication as to how the public generally regards utility issues. There is a comparatively small volume of sales and purchases of common
stocks at this time and in the past several years.
1767 The financing through the issuance of common stock
has been smaller than usual; but I think that it can be done if, as and when there is need for equity capital by a soundly financed corporation. Based upon that statement, my general knowledge, and quite a number of other things, I think that an investor would take a smaller yield on securities of a regulated company, and that he would give no particular weight to any possibility of reduced

earnings through varying demand in the case of a natural gas company. I have given the element of risk in varying demand as applied to defendants the weight which I thought it deserved. I have given these companies substantial weight for risk. The riskless securities that I heard you talk about were 1.35 per cent. Now, I said six per cent. That is an awful leeway for some risk, isn't it? You ask if I have given substantial weight to the risk of varying demand. I have given it the weight I thought it deserved. Substantial is a very vague word. Would you call 1/16 of one per cent substantial? I am talking about 1/16 of one per cent of return on a rate basis of $60,000,000. I never said a while ago that I didn't think that was a risk of any substantial importance. I said it is not a risk of substantial importance when compared to that kind of a risk in unregulated business. I started out in my direct testimony to lay a background of the risks that are facing unregulated business in order to arrive at the reasons that a utility under regulation should not be allowed the type of returns that are made by unregulated industries, when they happen to be profitable. I never ignored the risks that are facing defendants or gave them insubstantial weight, otherwise how could I get six per cent. I would have wound up with two per cent if I thought they were insubstantial risks.

You ask if as to this one particular risk I have said that as applied to these companies which are now under regulation, it is not a substantial risk. Compared to unregulated industries that is my statement, and in my judgment as to a proper rate of return I have so rated it.

In my direct testimony shown on page 8041 I stated that the next element of risk which defendants had in a negligible degree by comparison, is that of the labor situation. You ask what I refer to by the expression the risk arising out of the labor situation. Well, the type of risk in the labor situation is demonstrated by the quite general situation that a manufacturer undertakes his contracts in advance of production, and then is called upon to fulfill those contracts, generally at a stipulated price. During the course of that fulfillment he is dependent upon labor to produce the required goods. If there is any dissatisfaction in labor the manufacturer either fails in fulfilling his contract or he finds his estimated profits substantially reduced. Investors regularly and generally take notice of that risk or hazard. It is naturally reflected in the yield which the investor would demand on the investment. Yes, I say that whenever a manufacturer contracts to deliver his products at some future day at today's prices he must face that risk.

You ask if I do not agree that defendants are in that situation so far as the fact that they are under contract to deliver at fixed prices on into the future is concerned. You have to the extent that labor is a factor, a variable factor, of course, in your instance. In so far as you are selling your commodity under a fixed contract you have some labor risks. In so far as you sell it under rates promulgated by the Federal Power Commission, you will have no labor risks, because that will be an operating expense; and if you have increase in operating expense which justifies an increase in rates, you will get an increase in rates. I have no opposition to the company making money. I am an accountant. I am not charged with the duty of seeing that the company's rates are reduced. I am to investigate and report on the facts as I see them. When a company gets under regulation
1768 its labor hazard is over to a very, very great extent.

I know of no case where wages paid to employees who are working in the business can be excluded as an operating expense. I make no criticism of that, even though I have reason to believe that they may be excessive because of certain circumstances. As an example of that, during the depression a great many of utilities found it desirable to discharge younger men in their employ, and keep the older men on the payroll. The older men, by reason of seniority, were quite generally getting a higher wage. In rate cases where I made investigations in 1935 and 1936, when that condition was prevalent, I pointed it out to the Commission, but there is no indication, either in my statement or the Commission's attitude, that wages honestly paid for men working in the business can be disallowed. I can't conceive of any Commission disallowing any such expense.

The demand of labor for higher wages is not the only labor trouble that industry may get into. It is slowing down of production. I don't want to get into all of the types. I have heard recently that in the building industry the A. F. of L. labor had refused to install materials produced in CIO factories. I don't think I want to pose as an expert on the labor situation. As an accountant I do know, however, that that is a prevalent risk; and certainly at the present time with the Chrysler strike we have a glaring example of the effect of that risk on industry, and its effects on a year's profits or a year's losses. Yes, there is the risk of strikes and other labor disturbances. I don't think that risk confronts these companies to any appreciable extent because their employees are scattered over a distance of some one thousand miles. In other words, I think that where you have one factory that employs, let us say, 3,000 men, you have a much larger labor risk than if you have those 3,000 men scattered in groups of ten over an area of 900 miles, or even over an area of 200 square miles. No, I do not think that the labor of these two companies is scattered in groups of ten, but it is more scattered than you usually find in an industry. You will find groups of men at each of the compressor stations. The risk arises out of the congregation of these men under certain circumstances. Now, if you have your men broken up into ten groups, you have probably one-third of the risk that you would have if you had them all in one group. You ask if the fact that some of them are rather remotely situated with reference to management adds to or detracts from this element of risk. I imagine that a man who has duties removed from management, and to some extent beyond the control of the management, would require a higher rate of pay, but I would not consider that that was a risk. I think there would be less likelihood of getting into labor disturbances under those conditions than if you had them all in closer contact with the management. One man alone is not liable to cause a labor disturbance, but a group of men working together may.

If you had 600 men all working in one plant, you would not have to get all or a majority of them agitated to start a strike. I think we have all been informed on at least reported facts that a few men can tie up the whole plant; not only that plant but all of the suppliers' plants that are around it. As a matter of fact, take the Chrysler suppliers, it was not their people that caused that labor disturbance, it was the Chrysler people. In the same way Chrysler might be confronted with that risk by one of its suppliers having a labor disturbance, by reason of the fact that he can't get steel or glass.

I made a distinction a moment ago between having 600 men together, or 3,000 men, and in having them scattered out in smaller groups over a thousand miles. That is

one of the distinctions. You ask what would happen
1769 if the group of men who operate the Joliet station
down here would take possession of the premises and sit down. You would have a very serious labor disturbance. You probably could not operate your pipeline until you had them under control. That is perfectly true of any station down the line. If the production crew scattered over the gas fields in the Panhandle of Texas were to go out on strike that might stop the operations of the pipeline. So you can have a strike in one of a number of groups in the case of defendants and put the pipelines entirely out of commission. I don't know how many strikes they have had in that field down in Texas. I haven't investigated that. Defendants have never been put out of commission by a strike. There is some risk there. If you had only one employee you have risk of labor trouble. We are talking here comparatively. After all, I am not trying to testify as to whether this risk exists or does not exist; but all of these risks must be taken together in order to arrive at a rate of return.

I say that this risk in the case of defendants is small as compared with industry generally; notwithstanding that at a dozen places, namely the ten compressor stations, the Joliet delivery station and the field, strikes would absolutely tie up the operation of the whole pipeline. You ask if that risk is confronting these pipelines just the same as the risk of a labor strike is confronting an industry which has its men all together in one place. If you mean by just the same, the factual risk, yes. If you mean by the "same" the same risk to profit and loss or damage to its property, no; because it is the total difference in the thing that I am interested in. I am not interested in whether they could tie it up for a few days or whether they could not tie it up for a few days; but what is going on in the mind of investors is what we have to evaluate; how prevalent that is in your industry; and how likely it is that the public authorities would step in here with this public utility and stop it. You ask what public authorities would step in in this instance. If it was Joliet the State of Illinois authorities would step in, I think, rather rapidly.

Yes, I have heard of labor strikes leading to the use of dynamite. You ask if I have heard of it in the newspapers. We had it more closely than that in the State of Illinois. I did not know that down in the State of Oklahoma, through which this pipeline runs, there have been repeated dynamiting of pipelines as a result of labor disturbances in the last three or four months. That is a possibility. That kind of an explosion separating this pipeline could amount to several hundred thousands of dollars to defendants. Yes, if it happened at a compressor station it might probably run larger than that. There would be some interruption in service and there might be some loss of profits. You ask how long it would take to rebuild a compressor station. I haven't made any investigation of that, of your setup for emergencies of that kind. I presume that the company has taken normal precautions against such catastrophies. Yes, it is quite a job to patrol a thousand miles of pipeline and it is also quite a job to patrol a thousand miles of electric transmission line or a thousand miles of railroad.

I think that there is an element of risk as to the possibility of labor disturbances confronting these pipelines to a degree sufficiently substantial to get some weight; but compared to ordinary industry any investor I am quite sure would agree with my statement that these companies have a much smaller risk arising out of the labor situation than ordinary industry. That is my judgment, on the basis of which I have given my testimony.

1770 You refer to my testimony of another type of risk shown at page 8042 of the record in which I use the language, "arises out of the overhead expense connected with the business, that is, the expense of operations other than productive wages and consumed materials. To a certain extent these expenses go on even if a factory is shut down completely; to a greater extent these expenses accumulate if the business is operating but at an unprofitable capacity. In the first place, the cubic foot sales of the pipeline company do not measure its revenue." I was talking there about the capacity charge in the contracts of defendants. I think your hazard in overhead expense is substantially taken care of with the capacity charge, due to the fact that seven and one-half million dollars collected for capacity charges would enable you to run along indefinitely and pay your expenses that required cash payment. I don't know exactly what you mean by the observation you have just made that that would be true if you are permitted to run along indefinitely under that contract. You ask if I am not here today as a party attacking the very contract that I say is defendants' security against overhead risk. I am not attacking anyone. I am testifying at the present time with relation to the rate of return which this company should be allowed to earn, and which in my opinion will be a fair rate of return. The Commission, of which I am the chief finance and auditing officer, is here attacking the price at which you are selling gas in the State of Illinois, and that price is made up in part of a capacity charge and in part of a commodity charge. You ask, if a reduction is made in your revenues the security which you have in your capacity charge against overhead risk may be reduced. If the price which you receive under that contract, which calls for payment partly on a capacity and partly on a commodity basis, is reduced it will not necessarily have been demonstrated that defendants have been confronted with a risk on the question of overhead expense. I don't see where any legitimate reduction in rates gives you a greater risk in earning that return. It gives you a risk that you are not going to any higher return, possibly, but not on that return.

I said a moment ago that defendants had an assured $7,500,000 a year under their capacity charge and for that reason they did not have this overhead risk. Now, if the three millions is taken out of the seven and a half million, then you will only have a four and a half million dollar guarantee, but if it is taken half out of commodity charge and half out of the capacity charge, you will have a six million dollar guarantee. If it is all taken out of the commodity charge you will still have a seven and a half million dollar guarantee. You ask what the commodity charge amounts to per M.C.F. In large parts, I think six and a half cents. Six. I haven't tried to remember those figures. I have them in my working papers. You ask if as long as I have been dealing with this subject I can't tell you what the commodity price under the contract here under attack is. First of all, I am not attacking it. Secondly, I am not interested in your present rate structure or your past rate struture or your future rate structure. My investigation was entirely to the line of what we are talking about now—the rate of return. The other investigations I made were relative to the company's incoming expenses for past periods, the cost of building its property, and the meaning of some company evidence.

It is true that the thing that has been the object of my attention has been the number of dollars that defendants have made and not the price of gas to the people of Chicago who are purchasing it here. I wouldn't say that I

haven't taken the trouble to see even what defendants are charging for it. I looked at the rate schedule and I
1771 did compare the prices under the various contracts,
but that was a long time ago. I saw no point to it at that time, and I have not bothered to remember. Besides which, I work on several cases at one time, and if I tried to remember things like that I would be overburdening myself. I simply can't. I believe in reporting things. If I want to find out what the price was, I would look it up for that particular purpose and not rely on memory.

You ask what is the capacity charge that is the subject of complaint in this proceeding. It amounts, as far as the Chicago District Pipeline Company is concerned, to substantially seven and a half million dollars. You ask what it is per thousand cubic feet. Five dollars and a quarter per thousand cubic feet of gas on the maximum demand registered by using the so-called firm sales. I mean five dollars and a quarter per month per thousand cubic feet. That is not based on the whole 210 million capacity of the pipeline. It is the maximum demand that was registered under certain conditions. There are several complicated clauses governing that, but to my recollection it substantially means the largest take, for what is usually shown as firm sales up to date. The figure happens to be 120 or 122 million cubic feet. I don't remember whether it is 120 million or 122 million per day. The reason for that capacity charge is that under their commitment to their purchasers defendants are required to hold 120 million cubic feet of capacity at the command of the purchaser. No, that is not the volume and the capacity price that was set forth in the contract as it was originally made. There have been some adjustments in favor of the customer. I don't remember the figures. It runs in my mind from five fifty to five and a quarter, and I don't remember what the other amounts to. The revision took place in 1935, I think. That was before the line was fully loaded, on what you have called fully loaded. I think we are in the same problem that we are into as to capacity. Is a capacity all that you can possibly produce or is it the reasonable maximum normal production, or is it a possible peak which you know can be produced and which is your objective to keep on producing? Now we often hear that capacity for steel is 85 per cent of normal production. They can go up to 105 or 108 per cent of the rated productive capacity. In 1935, at the time the investigation of the capacity charge was made, the pipeline was not transporting and selling as much gas as it has produced during the three or four years since that time; yet it was revised, I think to some extent it was the result of the case before the Illinois Commerce Commission, and to some extent it was possibly the initiative of the Chicago District Pipeline Company, and behind it the Chicago area utilities. Yes, the capacity charge as it was originally written as to both the price and the volume was revised, whether it was to meet the necessities of the Chicago District Pipeline Company or whether it was under pressure brought by the Illinois Commerce Commission. I think there is a possibility that that might happen again either on one of those considerations, or maybe some other considerations might enter into it.

(The witness continued his testimony as follows: "the company might become ashamed of its profits and decide of its own accord not to make so much." Upon being accused of joking by Company Counsel the Trial Examiner ordered the answer stricken whereupon the witness continued: "I am not joking. Why do you think utilities make rate reductions of their own accord? Because they know they are getting too vulnerable and they are ashamed of their profits, and when I made investigations of those systems I found statements of that system that 'beyond this point, we do not dare to go.'" Upon motion by Company Counsel the Examiner ordered stricken the statement of the witness over objections of counsel for the two commissions.)

You ask if, in the light of the history of this capacity charge and of the circumstance that that capacity charge is right now the subject of this inquiry, I don't think that I have rather lightly dismissed it in my direct testimony when I say that this one factor removes the pipeline from the plane of ordinary industry into that of a guaranteed industry. No, I still expect the Federal Power Commission will allow you a capacity charge which will be what capacity charges usually are; the reimbursement for those necessary expenses which are so basic to your operations 1772 that they cannot be properly loaded on the quantity of your commodity which you are selling. Now, that is the purpose of the capacity charge. I think if the Federal Power Commission were to find that the capacity charge was an adjusted charge for that purpose, that you would then be allowed the capacity charge, and any change in rate must come from the commodity charge. You ask if I didn't treat it in my testimony as a fixed sum of money, and if on cross-examination I did not state it in terms of seven and one half million dollars and said that these companies having that much money did not have any risk as to overhead expense. Certainly; that statement is true of the seven and a half million dollars, but I also felt I had a right to assume that there is going to be a demand charge or a capacity charge in any rate that the Federal Power Commission promulgates, and that that demand or capacity charge will be a proper one, one which will reimburse the company for just those expenses, which are the subject of the type of risk I am discussing. That is the idea of the capacity and demand charge. No, I have not in my direct testimony treated this particular risk which I say is applicable to other businesses as if you had a capacity charge fixed permanently which would take care of all of your overhead expense. I have said that you did not have that risk because I contemplated that you would always have a capacity charge and that that capacity charge would be the proper charge, not necessarily seven and a half million dollars. Offhand I do not know whether that is too high or not high enough. But whatever the Federal Power Commission through their rate department finally determine is the proper capacity charge is going to remove this type of risk to a very substantial extent from your business. That is certainly what I had in mind. I think that is what I said. Let's read it and find out.

On page 8043 my words are, "Even if the pipeline company sold not one cubic foot of gas, it would collect a demand charge from its principal customer, the Chicago District Pipeline Company, sufficient to pay all of its expenses including its present interest. Any business that has its complete overhead paid for regardless of business conditions need not worry about risk." Yes, I did assume a capacity charge that would take care of overhead expenses, including interest. I made that assumption in appraising that risk when I was considering the facts which led to my judgment expressed by me as to appropriate rate of return.

I remember making the statement "Another risk from which the Natural Gas Pipeline Company escapes is the credit risk." I can't recall the exact words, but I feel that utilities in general have a very small amount of credit risk, and that this company in particular has a still smaller

amount of credit risk than utilities in general have. In that sense I am talking about bad accounts, yes. In the sense that a merchant charging goods to Tom, Dick and Harry may have trouble collecting some of his bills. Any industry must collect its bills, and in the process of billing has a credit risk. I make the point that "Natural Gas Pipeline Company has very few customers and its one large customer that takes 90 per cent of its sales has not only its own credit standing to rely on, but its payments are guaranteed by three Chicago area utilities, which guaranty would satisfy any credit man." The ultimate purchasers of this gas are the Peoples Gas Light and Coke Company, Public Service Company of Northern Illinois, and Western United Gas and Electricity Company. Because these utilities have respectively guaranteed the price charged to the Chicago District Pipeline Company for that part of the gas that they respectively use, I think that guaranty would satisfy any credit man. I do not think that there is any present prospect of either of those three companies
1773 getting into financial difficulty. There may be a lawsuit pending now in which the issue is whether or not they are making an adequate return on their investment, but there is a lot of difference between making an adequate return on investment and being able to pay their bills. It has not always been their situation that they contended they were not making an adequate return on their investment. You ask if there have been changes in their situation. There was a change, according to their contention, from the boom days of 1929. Peoples Gas Light and Coke Company had a pretty tough time of it in 1920, 1921 and 1922.

You ask if I know the comparative figures of the net earnings of Peoples Gas Light & Coke Company for the last seven or eight years. There is a substantial discrepancy between the reported earnings and my opinion of what they have really earned. You state that you want the figures which they have reported to me officially. I don't carry them in my head. I have them. I think there are annual reports showing their net earnings from year to year for the past five years available in my Chicago office, which is all I can reach by tomorrow morning, the years 1934, 1935, 1936. Older periods I think are back in the Springfield office only.

You ask if there is more security in just having a few customers than there is in having a great many. Not always. It depends on who the customers are, how many the great many are. If you have a million customers, each one of whom is going to owe you $2 a month, you have certain factors which cause bad debt losses, general economic depressions, or particular specified economic depressions in a particular time, but over a period of years you will probably lose less than if you are selling the same total dollars to one thousand customers. But looking at this particular company with this particular situation, I think that there is an advantage to having a few large companies here as against having the same sales from, let us say, ten times that many customers more widely scattered and each one of them smaller. I think all of your customers are large enough so that if it impairs their ability to enter into a contract, there will be a receivership, and about all you will lose is what you have allowed them to run up as unpaid bills, which will probably be the current month's bills, and no more.

You ask if that was the case with reference to this electric line running up the north shore in its dealings with the Commonwealth Edison Company. I know something about that credit loss. I think you are getting on very touchy ground. I think at the time that credit loss was allowed to pile up, Commonwealth had one look at what their investment was in that proposition. They lost a very large sum of money in that one account. I don't remember that it ran into millions of dollars. There was a substantial sum of money, there is no doubt about that, but that was not due only to the inability of one customer to meet its obligations. That was due to the fact that the management of the Edison Company permitted that customer to fall behind in their bills over a long period of time, and the only reason that I can see that they did it was because of a community of interests as an investor with that company. I would think that was more in the line of an investment loss than a credit loss.

If one of these customers taking a very large per cent of defendants' total pipeline capacity were to get in a position where it could not carry out its contract to purchase, you would have a credit risk. You ask if
1774 you would not have that credit risk until it occurs.
I say my present appraisal of that risk is that it is very, very small; that over the life of your particular contract here to 1954 I think those three Chicago area utilities will be solvent enough to pay their bill for wholesale price

of natural gas, even if they do not pay their bond interest. A great many business men sell goods on credit knowing that the customer is very, very shaky. In those circumstances they try to get special compensation for the extra risk. In the case of defendants, if they exercised their judgment and stopped the delivery of gas before the amount accumulated, as I have said was done in the instance of the Commonwealth Edison Company, defendants would still have a tremendous difficulty facing them in that they would lose that volume of business. If the Peoples Gas Light & Coke Company goes broke you will have a much worse business than you have today. But they will have to go broke before 1954. I say that defendants have added security in that they have only a small number of customers of the type I have previously described.

If you had a hundred customers that were of the same quality in proportion to the quantity of gas they were buying from you as these dozen or fifteen that you have, you would have a better position from the standpoint of risk. I most emphatically do not think that a pipeline which serves three hundred cities or one hundred cities is in a more secure financial position than defendants who serve the City of Chicago and only a few towns down the line in Iowa, Nebraska and Kansas. I don't think there is a better market in the United States or even in the world than the Chicago market, for growth, prosperity, or any way you look at a market. I do not think that selling the same quantity of gas to three hundred towns would make your company any better or any stronger than selling it to the area to which you do sell it to.

Yes, I saw your gross income fall $1,100,000 in one year. I may be a little prejudiced in favor of Chicago, but I think that if Chicago and this Chicago area slumps down substantially, that slump will hit the whole nation at least as much. My discounting of the risk that defendants are serving only a few customers is based in part on the fact that I don't think the city of Chicago and the utilities serving that area are going to go broke, and that the balance of your customers also seem to be people who are a respectable credit; it is different than trying to serve people in sparsely settled areas. I gave no weight at all to the fact that the three Chicago area utility companies might go broke. I assumed that during the life of this pipeline that they would be solvent enough to pay for the gas they are getting from you. As far as the other customers are concerned, I believe that they are all of the type that with reasonable credit restrictions, not allowing the bill to run too high, there will be no substantial credit risk. Not the type of risk that faces ordinary business. I don't think I meant to say at any time on any of those risks that you had not any part of them at all. They are all present, but not anything like in the proportion you find in ordinary business. I cannot conceive of the Chicago area failing or going broke.

Yes, I said on page 8043 that "another risk from which the Natural Gas Pipeline Company escapes is the credit risk." Do I have to add that I did not state positively? I said that in my direct testimony, yes. You ask what I was referring to in my testimony on that page when I said "another risk." I was referring to all the others.

You ask if in my direct testimony I have treated all of the risks that I have mentioned, namely, the risks involved in the accumulation of inventories, the risks arising out of the labor situation, the risk of overhead expense, 1775 as being escaped by defendants. (Objection by Commission Counsel to the question as distortion of the witness' previous testimony overruled.) I did not so testify, and it was not my intention to so testify. I was comparing the risks facing this company with the risks facing ordinary industrial concerns, to act as a background for a conclusion that this company is not entitled to the kind of profits that may be earned by ordinary industrial and mercantile concerns. For that purpose and for that purpose only. When I came to evaluate the risks of this company, I gave all of the risks as I saw them, with liberal leeway, in my opinion, a substantial recognition, because I heard discussing at one point 1.35 per cent as a return on substantially riskless securities and I reached a conclusion of six per cent. Now, the difference between those two is for risks. When I said "another risk from which defendants escapes is the credit risk" I meant another one of the risks which defendants do not have as the same important factor in their profit and loss situation that ordinary industry does is the credit risk. When I say a little later that the two companies have substantially no risk, I am talking about defendants. You ask if I meant by the statement "another risk from which Natural Gas Pipeline Company escapes is the credit risk" to put all of these risks in the same classification as being insubstantial. No, as being merely another risk, which as the result of my appraisement of risks defendants are not entitled to the kind of return that is made by ordinary industry. When I used the expression "another risk" followed by the expression "escapes", I meant that in ordinary industry quite generally the credit risk is an important factor in determining the profits they are going to make, whether the credit risk is decided in favor of restricting credit and limiting sales or expanding credit and increasing sales, and that defendants, as compared to ordinary industry, have no substantial concern upon that score. That is another one of the elements of risk, and I did not testify on all of the elements of risk I could think of, but that is another element of risk that caused me to reach the conclusion that defendants are not entitled to the same kind of earnings that an ordinary industrial or mercantile concern may make.

I said there that the Natural Gas Pipeline Company escapes the credit risk and I said lower down that the two companies have substantially no credit risk, and I use that language in the first sentence in connection with the expression "another risk". I told you what the other risks were that I was referring to, namely, that I was referring to all of the risks I had been discussing down to that time. I did not regard all of those risks as being of the same type, merely as another indication. All I am doing or all that I am trying to do is to evaluate the Natural Gas Pipeline Company as against an ordinary industry. We can look at the indices of earnings made by ordinary industry and know that the Natural Gas Pipeline Company must be lower than those, if my factors are correct. Now, I tried to get all of the factors. I say in no substantial degree I can find no substantial reason for not coming to the conclusion that the Natural Gas Pipeline Company cannot be expected to earn as a fair return the same kind of profits that are earned by ordinary industry. That was the sum and substance of my thinking, and that was the sum and substance of what I was trying to present. I did not in any of these cases intend to indicate that they had no such risk or that that risk was so insubstantial that it was not to be given consideration, because, as I indicated before, Mr. Morgan, I did get over 1.35 per cent.

I used the expression to which you refer, "Another risk from which Natural Gas Pipeline Company escapes is the credit risk," because I had no conception that those words

would be interpreted as meaning that the Natural Gas Pipeline Company has absolutely no credit risk or
1776 that my testimony would be interpreted as meaning that they have no risk from any of these sources. I am merely saying that they escape the usual risk from these sources that are present in ordinary business. I am comparing the Natural Gas Pipeline Company with ordinary business. At no time have I tried to compare it with the Commonwealth Edison Company or the Peoples Gas Light and Coke Company or with investments in bonds or government bonds or foreign securities. I am talking about industrial concerns on the one hand and Natural Gas Pipeline Company on the other hand, in order to come to a conclusion on rate of return. That is all.

You ask if in my direct testimony I did not take the position that such competition as these companies have has to do with industrial gas; that there is practically no competition except as to industrial gas. I don't want to get into a repetition of the same statement. Now, I meant the competition that existed, except for industrial gas, is not important as risks go in industry; that the competition for natural gas is somewhat more important than the other, and it is closer; but still not up to the risks in general industry from competition by competitive products.

It is a difference in degree; and I think the competition in the field of industrial fuel, while of more consequence than the competition in the commercial and domestic gas fields, is not the character of competition in the ordinary industry.

I don't take the position that there is no competition with natural gas in the kitchen or in househeating. I am very well aware of the competition by electric ranges and other types of competition; but they don't have the importance that is ordinarily associated with the element of competition in ordinary industry. Theoretically, natural gas competes with any form of substitute fuel—electricity, manufactured gas, oil, coal, any specialized fuels or services that might be used for the same purposes that natural gas is used. Oh, yes, I know that there is severe competition between coal and natural gas for industrial purposes. To a gradual degree for the cooking load; yes; and in house heating there is more competition between coal and natural gas than there is for cooking. The competition is not necessarily confined to price; it is the degree of heat. Sometimes it is one or the other. I have known people in the glass industry, and the pottery industry and brick making, to say to have a good plant for those types of manufacture you need natural gas. We find them located where there is natural gas, where there is a good cheap supply of natural gas. There are other types of situations where coal might have or might obtain a fuel advantage. I am not a fuel economist, but I don't think that that is the kind of competition that obtains among the three automobile companies that I have named, the Plymouth, the Ford, and the Chevrolet. In fact the reason for that is that I don't think it has the effect on your profit and loss account that the other type of competition has.

You ask if I have known of any natural gas company that has grown from the proportions of the Ford Motor Company when it started out to its present proportion, on its own weight. That introduces a new factor. No, there is no natural gas company which is as large as the Ford Motor Car Company is; but natural gas has had a very substantial growth in certain areas. It is true that a particular company usually puts in a very substantial capital investment at the time it starts out. That is true of the exploitation of natural resources today. That was not true in the early days of the use of natural gas. I have examined the records of
some distribution systems in the east that had very
1777 modest beginnings. At that time they only sold it
for certain uses and for comparatively short distances. They did not pipe it for a thousand miles in those days. Defendants pipelines, as far as size is concerned, were about as large and about as long in 1933 and 1934 as they are now. I take it that the pipeline was designed with due regard to the most efficient exploitation of the gas market. No, I do not know of any effort on the part of the Ford people to prevent the sale of Plymouth and Chevrolet cars by legislation, or by imposing a tax on the other one that would make it impossible for them to sell. I don't think that is the type of tactics that the Ford Motor Company or any individual company would employ towards their competitors. That is not a part of their competitive methods. You ask if I know of any effort on the part of those interested in the coal market to do just that. They could not advocate that tax just simply on the basis of taxing the natural gas company so it would have to stay out. They would have to bring some broader reason; and before they get it I presume they will have to show some substantial reason for it. However, if such tax is imposed, I

am quite sure that it will be passed right down in the rate to your customer companies, and from them right down to the Chicago area consumers. You ask if it will be done just like the sales tax was passed on down by the Peoples Company. They did not get an increase in rate to pass on that tax because the Commission determined that it was making money to absorb it; but in all my statements on income available for return I have given 100 per cent allowance for that tax as an allowable operating expense under the law; and every Commission must allow it in fixing rates. You ask if the effort of the Peoples Gas Light & Coke Company to pass that tax on through an increase in rates was not what started the rate litigation between it and the Illinois Commerce Commission. That was one of the initial proceedings. I don't know whether that was what started it. That might have been merely the motivating cause. They might have been thinking for a year or so that they should have an increase in rates. I don't know what was in their minds. That was the first proceeding that came before the Illinois Commerce Commission that I remember. I don't know whether there were any negotiations. A company can't merely come in and say we want to talk on this, that, and the other item. They must file a schedule of rates. The Commission takes that schedule of rates and decides on the valuation of their property the proper amount of money they are allowed to make, and whether they are making a fair return, or a sufficient return. You can't change rates for one factor. If you are going to change rates, the Commission must take everything under advisement.

To repeat, I said that if any tax is levied on your company that tax will be an item of operating expense, and in determining the reasonableness of the rates the Commission must give it full allowance as an operating expense; and that therefore, if any additional tax is imposed it will ultimately go down in the price to the customer companies, and from the customer companies ultimately go down to the consumer. You ask if I am not referring to a tax at a rate that will not permit the sale of gas in competition with coal. I think that a suggestion that it would not be is rather a too far fetched assumption for me to accept. I do not think a tax which would make it prohibitive for these companies around Chicago to buy gas can be levied. You ask if I don't know that that kind of a tax has been suggested by bills actually brought in the Illinois legislature every session since the pipeline has been in operation. I can't stop bills that are presented in the legislature. Almost any kind of a crazy bill can under certain conditions find a sponsor. I have no information as to how many of these bills have passed either of the houses of the 1778 Illinois legislature. I don't know that the Senate actually passed a bill levying a five cent tax on each one thousand cubic feet of gas sold in the State of Illinois, but if it had that is still far from levying a tax that was prohibitive for the sale of gas. A bill which will pass one of the houses is always a possibility, if you are talking again about these possibilities. You ask if that isn't what a risk is, a possibility. No, a risk is an ever present force of influences that shape your profits and your losses. A risk is not necessarily a loss. A risk might be met and become a profit, but you have taken the risk just the same. If I go out and buy securities today, I take a risk. I may make a profit or I may make a loss; but I have risked that money, and for the risking of that money I want a return.

I have taken all the risks into account. A risk to me is anything that is ultimately going to be reflected in the profit and loss account, in the earnings that you get at the end of the year, or five years, or the whole life of the property. Those are the risks; if there is a risk it is ultimately going to increase your profits or decrease your profits, or leave them the same; but the effect of the risk shows up in the profit and loss account.

1779 If some tax were passed and defendants felt that it ought to be passed on to the public, it would be done as soon as they could prove to the satisfaction of the Commission or Commissions having jurisdiction that they are entitled to pass it on; and in my opinion under regulation they would be able to pass it on more rapidly than they could under certain forms of contracts.

The sales tax that is involved in the Peoples controversy was passed and found unconstitutional and the companies received a rebate. I think it was finally determined that the companies had to pay it in 1935. The fight is still going on. They have impounded the money. If they have a right to recover it, they will get it. If they have not the right to recover it, the consumer will get the money paid the company. They have no risk from that standpoint. If they are entitled to it, they will get it.

You ask if they will get it after a fight which has already gone on since 1935. After the fight has nothing to do with it. It is merely to determine whether they are entitled to it. They haven't a clear cut case.

You ask if an investor would assume that they were going to get it if he were dealing with their securities now or would their credit standing be impaired. I think investors would probably try to guess which way the case is ultimately going to come out. If it ultimately comes out that they will get this impounded money, that stock is a pretty good buy at the prices of the present time. If it turns out that they are not entitled to it, I think the stock is about properly priced at the present time.

I will say this, just to get one step removed from the Peoples Gas Light and Coke Company, I don't think that investors generally have anything like the widespread fear of regulation reducing their earnings below a proper return that is indicated by newspaper comment. People are still very anxious to buy public utility securities.

You ask whether it makes any difference how the tax is imposed if it be sufficient to prevent industry from buying your gas. That is right. If such a tax is levied, it will not make any difference to you how it is levied, if it results in depriving you of your customers.

You ask who is agitating for that kind of a tax in Illinois. I presume it is the coal miners, as a labor group; and the royalty owners and coal mine operators as a group of business men engaged in a competitive business. You are right; the railroads are. I was going to add that. It slipped my mind for the moment; all the railroads. I have heard many complaints of your company from a certain railroad which has very close relations with coal mines at the present time. I know that there is agitation among those three groups of people, the railroads, the coal operators, and the coal miners, demanding that the state take natural gas out of competition with coal. When you say "very strong," I don't think it is as strong as the agitation against chain stores. I don't know what you mean by the term "very strong." Give me the basis of it. There is a strong sentiment among all these people that there ought to be levied a tax on natural gas which will take it out of competition with coal.

You ask if there exists a substantial risk that these companies may find themselves confronted with that kind
1780 of a situation. If you mean by substantial risk that
there is some possibility, the answer is yes. If you mean that it is something which really deserves special

consideration to the extent of, well, you name your figure and we might come to an agreement—but that is too vague and general a question. There is some element of risk there, yes.

I have no intimate acquaintance with the report of the Natural Resources Committee to the President of the United States, and by the latter transferred to Congress. I know there was such a report. I heard something about the recommendation in that report for the setting up of a public resources commission which would have absolute control over the production and the use of power, coal, natural gas, and oil in this country.

You ask if the objective was to regulate natural gas for certain purposes, and that oil be used for certain purposes, electricity for certain purposes, and that coal be used for certain other purposes, each to the exclusion of the other. There was some such arrangement proposed. I don't know whether, following the receipt of that report by Congress, a bill was introduced with the objective of putting that recommendation into a legislative act.

I think Mr. Frederick A. Delano was head of the Natural Resources Committee which I suppose made that report.

You ask if I remember that the President in forwarding it to Congress recommended that it be given serious consideration. I think it probably deserves serious consideration.

You ask if I thought that that raises a risk confronting natural gas pipelines which derive a major portion of their revenue from the sale of gas in competition with coal for industrial uses. I am firmly convinced, regardless of what happens, that your property will not be confiscated, and that you will be allowed a fair return on the fair value of your property.

You ask if I think there is any risk involved there of such substance that it is entitled to any consideration in arriving at a proper rate of return for defendants. Again, I am evaluating all the risks; not finding an absolute factor as to the effect of each one. I am not trying to determine each individual risk, how much it existed, or how much shall I allow for it. I have compared the risks of this company from various sources, compared with the risks of various industrial business; and I have reached the conclusion that it is a low risk from that standpoint, and therefore it should be allowed a lower return, and I think I have allowed a return fairly compensatory for all the risks involved without undertaking to find how much is involved in each individual risk.

We are not trying to evaluate these risks separately. That is not my testimony. My testimony is that the natural gas industry has less risks than industry in general. That is my statement, and from that I draw my conclusions. I considered a great many risks which I did not discuss.

You ask if I considered the competition with coal, or the imposition of a tax, or direct intervention by the government which says that defendants can't use gas for fixing boilers. The answer to that is that in my judgment no such risks exist, because your companies' property will not be confiscated, and you will be allowed to earn a fair
return on the fair value of the property, or receive
1781 compensation for your property, regardless of what
laws are passed. I did not consider that any such risk would exist in determining what I concluded to be a fair rate of return. I did not give those two factors, which we have been discussing, consideration alone. I gave no consideration to the fact that a law might be passed which would put you out of business without your getting something for it. I certainly think a rate of return that did not make any allowance for that risk could still be a fair rate of return.

You are right, in my direct testimony, I have been talking, down to this point, about risks that were not mentioned by the company witnesses who testified on rate of return. I had in mind the industrial statistics that were put in one of the exhibits sponsored by defendants. The whole tenor of my discussion of risk is that the Natural Gas Pipeline Company is so situated from a risk basis that it does not deserve the similar kind of returns that are made by unregulated industries in general.

You ask whether in my testimony I was relating it to the industrial statistics the company had offered. Yes, after all, when we are discussing a rate of return we are faced with this problem; that most regulated industries are earning returns that are fixed by Commissions, with the exception that very often they get a little bit ahead of the Commission and are making an excessive return. Now, it is, therefore, difficult to find what rate of return is allowable for a utility, because those returns are regulated by Commissions. For that reason a great many people are introducing statistics on returns earned by industrial companies. I merely wanted to say, if I use returns earned by industrial companies; I must be appreciative of the fact that the Natural Gas Pipeline Company cannot earn that amount of return, because it does not undertake that much risk, and that I have a perfect right to send the return of the Natural Gas Pipeline Company below that made by industry generally. That is the whole purpose of my discussion of risk.

I have read the testimony of the rate of return witnesses who testified on behalf of the companies. You ask if any of them mentioned as elements or factors entering into the judgment that they reached on the proper rate of return any risks as to inventory or overhead or labor disturbances. They did not so mention. And in my opinion that is the weakness of their testimony, that when you are appraising risk you cannot pick out these three risks or six risks or ten risks as present in the natural gas industry without discussing them relative to other industries that you are going to use as your standard for arriving at a conclusion of rate of return, and without taking into consideration all the risks of all kinds of business.

You ask if I know whether or not they took them into consideration. In my judgment they didn't if they reached eight per cent. There is nothing in the record to indicate that they took into account the situations of these companies on those particular elements, which I have discussed, or that they did give consideration to these elements of risk. As I stated, there is no indication in the record to show whether they did or did not. I concluded that all things considered that they did not, and that they certainly did not draw the attention of the Examiner or of the Federal Power Commission to the risks existent in normal business, which are not present to anything like that degree in this business. Yes, they were talking about the risks confronting the natural gas business. I have not enumerated all of the risks that I considered in arriving at my judgment.

1782 You ask if there was any less duty on my part to state all of the elements and all of the factors that I considered than there was on the part of those men who testified for the companies. I at least pointed out the risks on both sides, those where the one is greater than the other, those where the other is greater than the one. I am trying to give an evaluation of risks to present some additional information to the Examiner and to the Commission on that point. I did not think it was necessary to elaborate any further in the light of the fact that Mr. Booth's question originally was: Will you mention a few of them? And I could have talked for two more days on risk very easily.

You ask me to show you some place where I pointed out in my direct testimony any risks which I said that defendants are confronted with to a greater extent than similar risks confronting other businesses. I made no specific mention of the risks, but I gave them consideration. I thought certainly, to my mind, that if the risks that the company experts had talked about had been fully covered to all the degree that they should be covered, the Federal Power Commission could evaluate how important those risks were. I merely wanted to point out the other side of the problem, and with respect to one particular kind of risk that they elaborated on, to differ with the opinion of your experts. In the ones in which I differed with them, I stated my views.

Redirect Examination Interposed by Mr. Booth.

You ask if I mean to say that I agree with the other points they covered in their testimony. I am not disposed to argue that there is no risk there. There are some risks in these companies. It is more along some lines; it is less along others. By and large the average balance that I strike is that they have considerably less risk than an industry.

Cross-Examination by Mr. Morgan Resumed.

No, I did not feel it necessary to point out the risks that confront the natural gas companies and which do not confront other industries to the same degree.

You ask if I think that the defendants' witnesses should be criticized because they did not enumerate all of the risks that I have enumerated here. They should certainly have given the Examiner and the Commission enough indication to show that they considered this question of risk proper and one on which they could have reached a judicial decision.

You ask why I didn't do that. The answer is because I am the second set of witnesses. Their evidence is in. It is before the Commission. They know all about that. Why should I go over them and try to whittle down because I think they put it a little strongly? But I am saying now that the Examiner knows that. I merely want to point out the other side of this picture for the purpose of arriving at the conclusion that I arrived at, taking into consideration the risks that they pointed out, those that I pointed out and those that are still unmentioned in the record, that this utility does not deserve as high a rate of return as an industry does.

You ask what I mean by industrial institution when I make that statement that defendants are not entitled
1783 to as high a rate of return as an industrial institution. I am speaking of the steel industry, the motor industry, general manufacturing industry, shipping, copper mining; industries where the prices and profits depend upon competitive conditions and the ability of the management to meet those competitive conditions. Among others, I am talking about General Electric, General Motors, Radio Corporation, Marshall Field, the moving picture industry, the companies that are making the losses and the companies that are making the profits, the companies that are in profitable lines of business and the companies that are in unprofitable lines of business, all of them. I am talking about the oil companies also. I do not think defendants should earn as much as the oil companies.

You ask if I know how much less they ought to earn than the oil companies, General Motors, Radio Corporation, General Electric. I am trying to take all of those industries, the good years that they have and the bad years that they have, and determine from that about where in the scale of return, from 1.35, let us say as the bottom point, up, what fair return for this company should be fixed. I think that is our problem in this thing.

You ask to what extent have I studied the returns of these companies, which I say ought to be greater or higher than the returns of defendants. I am generally familiar with the results of business. I have looked at some of the results. I took the trouble to take down certain statistics on some industries. For 1937 I have some of the automobile companies down in detail and general figures on agricultural machinery, implements. Let me see. There are 18 sets of average figures that I took a good look at, to see where they are, what they are making.

This particular compilation comes from some studies compiled by a PWA project, I think it is, from S. E. C. filings. I took off data on sales, net profits, depreciation depletion, because that is a factor in here. After all, when you are looking at return, you look at how good is depreciation depletion, how good is this company, how many of them make profits, how many of them make losses, what is the relationship to sales, what is the relationship to net investment. I have the balance sheet statistics. I took a general look as to what they are. I did not get this information from Mr. Gilman's exhibit. Yes, I saw his exhibit, but this is not the same information. You can check it, if you want to.

You ask why I prepared this list of risks, which I say exist in industrial enterprises to a greater degree than in business of defendants, in the preparation of my direct testimony. I prepared it to present some additional information to the Commission on the subject of the comparative risks faced by this company as compared with industry generally, for the purpose of arriving at a fair rate of return.

You ask if I prepared it on the theory that testimony had been offered by defendants that because some industry or group of industries earned a certain percent, that defendants ought to be permitted to earn the same percent, and if that was my understanding of the testimony at the time I prepared the data from which I testified on direct concerning these risks we are talking about here today. It was necessary for anybody reaching a conclusion on the question of rate of return. In the first place, that is the duty of witnesses. After that it becomes the duty of the Examiner and then of the Commission to make that
1784 decision, that there should be a more complete discussion of risks than was available, in the record, some further data. I then went on after I thought I had amplified the record on the subject of risks and testified to my conclusion on rate of return.

The figures I have handed you are not Mr. Gilman's exhibit. My working papers were always available to counsel for the company. The sheet I have just handed you is really a sketch sheet, not working papers, to get some data down, to get my mind down on something, so I merely presented it to you to show that it was not Mr. Gilman's exhibit. I just wanted to show it was something I prepared myself, and that it was not Mr. Gilman's exhibit. I have had all of the free ones in my office for quite a while, that I used from time to time to get oriented. I did not take all of them. I know what the reported earnings of General Motors were last year. I don't remember.

You ask whether the earnings of industrial companies like that enter into my judgment of a proper rate of return for defendants. I took generally the rate of return earned by industry, that it was earning its return purely on the basis of competitive conditions and the ability of the management to meet those competitive conditions, because that is our base. I think the whole problem of regulation is to substitute for competitive conditions regulation, and that what a utility should be allowed to earn is giving full account to all of the risks for a return that is equivalent to what it would earn if instead of regulation we had competition, such that there would be no more risks.

Now, that is a rather difficult thing to get to, but, basically we have what are returns earned by investors of capital generally, in all kinds of fields, starting from the highest form of security, which has the lowest guarantee, going right up to the most speculative venture—what do they all get—and then going up to this condition here, with its sheltered position, its lack of risk, as to what is fair for them to earn. That is our problem in deciding on a fair rate of return.

You ask me what I mean by the sheltered position of defendants. I mean as compared to ordinary business they have a very substantial lack of risk, that capital usually recognizes that investment in utilities is a safer investment than it is in business generally.

You ask if I mean natural gas companies or all utilities. I mean all utilities, even those that have gone bad. Electric utilities are the highest, telephone, water companies are better than some telephones, but that whole field is superior.

You ask if, as a matter of fact, it isn't my judgment that these pipelines ought to be allowed a rate of return such as is commonly allowed electric utilities, and if that isn't the real basis of my judgment in this case. I go further than that, they should be allowed even less than most electric utilities. Yes, even less than most electric utilities, because I think they have substantially less risk than most electric utilities. Let me give you an example. Let us take the Commonwealth Edison again, if you please.

1785 In 1939 the Commonwealth Edison issued $415,000,000 worth of bonds to run for 40 years. Now, that is risk, 40 years. Since then World War II has started. We hope it will end. But World War III might start. Throughout that long period of 40 years all of the economic forces of this world will concentrate on the value of that bond issue. It is not even a saleable bond issue. A few insurance companies took it. It is listed on no exchange. Before they can let those bonds go out they will have to inform the public that the insurance companies are selling and want the public to buy one hundred and fourteen and one-half million dollars worth of bonds for 40 years. And for what? 3.16 percent interest. Now, that is what money is worth, 3.16 percent interest. That is set by the shrewdest buyers of securities in the United States.

You ask if that is a cost to the company or yield to the investor. I forget now which. Both of them are very close together. 3.16 percent sticks in my mind.

I hope Mr. Morgan understands what I mean now in general. In other words, they have got 40 years to go. They have a risk until they go broke, because that is the end of all corporations, except yours, Mr. Morgan, because you are going to get your money back in 1954. Most corporations will ultimately wind up in bankruptcy. It happens to most of them. They cannot liquidate. Just as the end of most people is death, the end of most corporations is bankruptcy. But not yours. You will have your money back by 1954, maybe twice over. That is the reason I say that your company has less risk than the Commonwealth Edison.

You are finished in 1954, with your money back.

You ask what is the rate of return allowed Commonwealth Edison Company at the present time. I made no such investigation. In the last rate case the Commission found that it was not unreasonable to permit the company to earn 6.3 percent.

Redirect Examination Interposed by Mr. Booth.

You ask if I am not thinking about the Public Service Company of Northern Illinois rate case. That might be. I give my testimony. After a case is finished I have nothing to do with it. I don't care whether there is a rate reduction or not. I am an accountant. I want to get the facts in the record.

Cross-Examination by Mr. Morgan Resumed.

You ask if in the Peoples case, reviewed by the Circuit Court of Illinois, over which Judge Klarkowski presided, the observation was not made by the court that the risks in the gas distribution business were greater than those in the electric utility business, and on that basis did he not fix the rate of return at 6½ percent to the Peoples. He might have done so. I still think I am more nearly right than he was on the subject.

You ask what study I have made as to the comparative risks of defendants and of electric utilities, of gas distributing utilities, and of natural gas integrated companies. I made no formal study, but I gave considerable thought to: Should this company get a better return than other companies; should the natural gas industry deserve
1786 a greater return or a lesser return than your large
distributing utilities, like Commonwealth Edison, of your scattered distributing utilities like Central Illinois Public Service, whether it deserves a better return than a manufacturing company does, or a lower return. I made no formal studies in the sense of getting research together, as to how many companies die and how many live, and how many are prosperous and how many are not prosperous, but I gave considerable thought primarily, though, to your two companies.

You ask if that was in relation to manufacturing companies. Yes, to manufacturing companies, and then I finally got down to—I started all the way from government bonds up to highly speculative industries and tried to get wherein between does this company fall, how would I compare it with this and with that and with the other.

You ask where I got the 6 per cent. I got it primarily on the basis of what I thought this company could finance at, what I thought this company could sell its stock and bonds for. I made a few rough calculations and decided it would be a good company to finance with serial bonds, and what would they require, and then common stocks for the balance, what would that take, and, as I remember it, I originally got about 4¾ per cent, and I upped it.

You ask if I upped it from 4¾ to 6. No, I did not, not from 4¾ to 6. From 4¾ to about 5½, for other factors, leeway, and to bring it some place, and finally I said there is a war on and I don't know whether they can do it for seven years, because when I was making this study the war was on and there had not been any security issues, prices were going haywire, nobody knew the future, and from the point of view of being absolutely sure that I was giving a liberal return, one that I could substantiate from any point of view, I finally decided on six per cent, with a rough guess, and that certainly under the worst condition now prevailing this company's securities would sell at par, if their bonds are paying four per cent and their stock is paying eight, and I don't think that anybody can deny that.

The fact that many electric utilities and some gas distribution companies have been allowed six per cent return and that these pipelines are among the public utilities had something to do with the judgment at which I arrived. The rate of return fixed for utilities by our Commission particularly, the general tendency that nowhere Commissions are fixing returns today, did have something to do with it. It was not primary, but that resolved part of the background of my thinking. Primarily I started with the calculation as to what would this company get to, where should it get to; where did this company get to from the point of view of financing, what would it bring out. You are right, I made no distinction between the character of these two pipelines, from the standpoint of the risks involved, and of electric utilities and of the distribution utilities, except that I reached the conclusion that they have less risks or fewer risks than do those distributing utilities. I did make a distinction. The distinction was that they are entitled to a lower rate of return than an electric utility or a gas utility.

(At this point the Commission Counsel called upon the company to produce a report of Ralph E. Davis, Inc., Engineers, dealing with the natural gas supply and values of gas producing properties of Texoma Natural Gas Company, as of January 1, 1938. Company Counsel objected to making the report available on the ground that it did not show the reserves in the Texas Panhandle Field in any respect. At this point Counsel for the Commission produced a three page document described as being a photostatic copy of request for voucher on Natural Gas Pipeline Company of America, in favor of Ralph E. 1787 Davis, Inc., Engineers; office copy of the check to Ralph E. Davis, Inc., Engineer; check of Natural Gas

Pipeline Company of America, and bill rendered by Ralph E. Davis, Inc., to Natural Gas Pipeline Company of America, dated June 14, 1938, with the request that it be marked as an exhibit. At the direction of the Examiner, the document was marked Exhibit 201 for identification. EXHIBIT 201 was offered and received without objection.)

1788 W. C. GILMAN, a witness for defendants recalled for redirect examination, testified:

(December 12, 1939.)

Redirect Examination by Mr. Hedrick.

In response to questions I testified in the record at about page 6297, that I believe the most appropriate capital structure for an enterprise of this kind is either not more, and preferably less than, 50 per cent in the form of senior bond securities and 50 per cent or more in the form of common stock. I added that, preferably I would say between 40 and 50 per cent in bonds would be best.

You ask for my reasons for that statement. I did not make any provision for preferred stock because I do not believe that it is economically feasible or desirable to finance a company such as the Natural Gas Pipeline Company of America or the Texoma through the use of preferred stock.

A traditional method of financing public utility distribution companies in the past has been to assume 50 per cent bonds, 25 per cent preferred, and 25 per cent in common. I think that there is some question as to the soundness of that traditional method, even with old established distribution companies. And I would say that in my opinion that it is not economically sound or desirable or feasible to finance a natural gas pipeline company with the use of preferred stock.

I think that is pretty clearly indicated by what has taken place in the industry. Mr. Smith's exhibit, No. 186, examining some thirty odd natural gas companies, or companies that he selected which had certain attributes, namely, transmissions and production, or transmission, but also including distribution companies, showed in all those cases companies with securities outstanding of over a billion dollars, with only some $60,000,000 preferred stock; and of that $60,000,000 only about $34,000,000 was stock that was held by the public, as opposed to the other $26,000,000 shown as being held by affiliates.

Now, even of that $34,000,000, all but about $2,000,000 was preferred stock issued by companies with great distribution facilities; namely, Southern California Gas Company, which had more than $20,000,000 of the preferred; and Oklahoma Natural Gas Company, which had distribution facilities throughout the State of Oklahoma, which had some number of millions of preferred.

Of all the preferred stock shown in Mr. Smith's exhibit, only something less than a couple of million dollars was the preferred stock of a natural gas pipeline company, namely, the El Paso Company.

This industry historically has not used preferred stock as a financial vehicle. It is understandable because the pipeline companies who finance through the use of debt, are required by investors to have debt with a modest term, and debt with heavy sinking funds that usually pay the debt over a relatively modest term of years.

Any industry that puts out a debt of that kind, with heavy sinking fund, is taking a chance if at the same
time it issues a preferred stock with cumulative pro-
1789 visions. There have been very few issues of pre-
ferred stock in the past by pipeline companies. The largest issue that I can think of by a pipeline company was that of the Southern Natural Gas Company, while it was being promoted, and which eventually got into receivership, and the people who bought the preferred stock lost their position and received common stock in the reorganization, a class of common stock in the reorganization. When they reorganized it they reorganized it with bonds and common stock; in the first instance two classes of common, and later in proceedings during 1939 changed into one class of common stock.

Questions Interposed by the Examiner.

You ask whether the features are approximately the same when I group those companies in Exhibit 186 according to those which are financed mainly through affiliates and those which are financed mainly through public offerings.

That is right. Schedule 5, page 6. You will note that in these some thirty odd companies, which had total securities outstanding of a billion and thirty-eight million, that the total amount of the preferred stock in that aggregate was about $60,000,000, or about six per cent.

Now, of that six per cent, about 3.3 or .4 per cent was held by the public, and the remainder by affiliates, as classified by Mr. Smith. Preferred stock that is held by affiliates is essentially the same as the common stock, in that it does not represent a preferred stock in the hands of the public.

Redirect Examination by Mr. Hedrick Resumed.

At page 6430 of the record, I testified that I had never said that because they had low taxes there was any special risk. I said that the possibility of increased taxes was a very definite risk; and the fact that the taxes were at a low level now made them particularly good prospects for the taxing authorities who were short of money. I also testified at that point that it follows for that particular factor that the lower the taxes the higher the risk and the higher the taxes the lower the risk. I think my statement there and my testimony in the same direction needs an explanation.

The point in my opinion is that if taxes of any particular company in an industry, or of any particular group of companies in an industry, are lower than the taxes of other companies or lower than the taxes of other groups of companies, that that particular company or that particular group in this day and age, when taxing authorities are pressed for finding funds, is a good prospect for additional taxes.

And while it is true that under regulation theoretically taxes are included in operating expenses, it is nevertheless the fact that if the burden of taxation of any particular company or any particular group is increased substantially at any one time, there is always a lag in getting back from the rate payer what you have to pay out in the form of taxes.

That is not completely theoretical with me. For a number of years with the Equitable, where I investigated and made recommendations with reference to the purchase of utility and other securities, we were very careful about the purchase of utility securities in the State of Pennsylvania.

1790 In the State of Pennsylvania at that time public utility companies did not pay taxes based on the property in the communities which they served. They had some form of gross receipts taxes of some character; but they did not pay taxes anywhere near commensurate with the taxes being paid by utility companies in neighboring states.

We were always afraid to buy the securities of Pennsylvania companies, and consciously stayed away from them, because we were afraid that the taxing authorities would get onto that fact in Pennsylvania, and at any one time step up the taxation of these companies, at which time the times coverage on the securities would have been reduced and the securities would have had a tendency to go down in price. We would demand a higher return for the securities of the Pennsylvania companies for that very reason.

Recross Examination Interposed by Mr. Slaff.

You refer to my statement in substance that while it is true that taxes were always considered a part of the operating expenses, there was always a lag in getting back from the rate payers the additional amount of expense incurred through additional taxes. You ask if there is a relative lag on the part of the consumers where the company under regulation may be earning what is considered or what is more than a fair return, in getting the return down to a fair return.

I think that is right. If a company is earning more than a fair return, and that is decided perhaps in a rate case; the new return only applies, from the termination of the rate case. These things can't be retroactive, as I understand it.

You ask if there may have been a return which goes above a fair return with no immediate reduction to the fair return, whatever that might be. That is asking me to generalize, Mr. Slaff, I don't know. I think in some properties, in some jurisdictions, the regulation has been awfully close.

Redirect Examination by Mr. Hedrick Resumed.

Beginning with line 12, on page 6467, of the record, I testified, in substance, that for a number of years, the gas industry has been suffering in competition and has lost substantial amounts of its domestic business. That statement was intended to apply as the record says, generally speaking, but it also does apply to the local distributing companies.

You ask what I meant by the use of the words "gas industry", appearing in line 13, page 6467. By "gas industry" I meant the total gas industry. I think in that connection we have to pay also attention to the statistics of the manufactured and mixed gas industry to get any degree of comparability. As to the development which has taken place in the natural gas industry alone during the past few years the statistics are not sufficient to tell us exactly what is going on because of the large amount of natural gas which has been brought in de novo to new communities. Therefore, the major basis of my statement "for a number of years, the gas industry has been suffering in competition" refers to the manufactured and mixed gas industry, the industry which includes the three Chicago utilities who buy the gas from the Natural Gase Pipeline Company of America.

1791 They sell a certain amount of natural gas direct to industrial consumers but primarily serve mixed gas, and they are included in the statistics in Exhibit No. 194. The foreword in Exhibit 194 states, "Companies selling mixed manufactured and natural gas are included in these data."

In Exhibit 179 the contrary statement appears. The statement appearing in the foreword of Exhibit No. 179 says, "Companies selling mixed manufactured and natural gas are not included in these data." For that reason I used the statistics of the manufactured gas industry as applying to the customers in the Chicago area of defendants.

You ask that I proceed with my explanation of the figures in Exhibit 194. From page 14 of Exhibit 194, the revenue in 1929 was $408,737,000. That had declined in 1938 to $360,494,000; a decline of approximately 12 percent during that period. The gross corporate income which was $123,409,000 in 1929 had declined to $67,570,000 in 1938, or a decline in the amount available for fixed charges of approximately 45 percent. The net income available for dividends and surplus amounted to $82,204,000 in 1939 and had declined in 1938 to $23,030,000, a decline of 72 percent; these declines taking place in a period during which plant increased from $1,825,000,000 to $1,967,000,000 and as shown on page 6 total customers increased from 9,690,000 to 9,941,000.

As further shown on page 6, the domestic business of the companies in this industry has shown substantial declines; taking the gas sales to consumers in millions of cubic feet, in 1929, amounting to 254,769, which declined to 197,052 in 1938.

Similarly, revenues which in 1929 from domestic service amounted to $313,955,000 had by 1938 declined to $258,357,000.

The tables on page 7 show what has been happening to the domestic customer in this business. In 1929 the average domestic customer took 27,600 cubic feet of gas for which he paid in that year $34.06. By 1938 his consumption had declined to 21,300 cubic feet of gas for which he paid a reduced amount of $27.94.

I think it is apparent that this industry has been suffering in competition and has lost substantial amounts of its domestic business.

Questions by the Examiner.

You ask if the data on the page where it is designated Schedule 1, Exhibit No. 186, have to be considered in connection with the statistics I have just read; that is, whether it would be proper to go one step beyond the statistics I have just read and add in the data in Schedule 1, Exhibit No. 186.

Those are all natural gas statistics. I don't think they can be added. Those statistics have to be read, I think it is proper to consider them, but just how much weight you can give them in comparison with these statistics is a matter which each person has to decide for himself in this case.

The gas sold by the Natural Gas Pipeline Company is
1792 sold to companies whose figures appear in here. By
"here" I mean Exhibit No. 194. The figures contained in Exhibit No. 179 are the figures for companies that sell only natural gas; and we have had such an exten-

sion of natural gas to new communities during the last decade I don't know just how much reliance can be placed upon them in trying to get an over-all picture of what is happening to the gas industry, looking at it as a whole.

A little later I have certain statistics which I have prepared here for the three utility companies in the Chicago area. I think perhaps they might go some way towards answering your question.

Yes, those are the statistics which we have already referred to in connection with the reports I have obtained from the Illinois Commerce Commission.

Redirect Examination by Mr. Hedrick Resumed.

Commencing at line 11, page 6473 and continuing on the following page, I stated, in substance, that the gas industry had lost substantial amounts of its domestic business; and that I intended that this statement should apply to this case; that when I talked about the domestic business, probably it is apparent that I was speaking generally, but that the distributing companies, the Peoples and the Western United, the Public Service of Illinois have, over a period of years, been losing domestic business.

In response to further questions, I stated that those companies have more domestic customers, but revenue is what counts; that their total revenues are higher than they were 5 or 6 years ago, but lower than 10 years ago.

(At this point counsel for defendants handed to the reporter a document entitled "Data on Sales, Revenue and Customers, Peoples Gas Light and Coke Company, Western United Gas and Electric Company, Public Service Company of Northern Illinois, Witness, W. C. Gilman", with the request that it be marked for identification. At the direction of the Examiner, the document was marked Exhibit 202.)

The statistics contained in Exhibit No. 202 for identification are statistics of Peoples Gas Light and Coke Company, Western United Gas and Electric Company and Public Service Company of Northern Illinois, particularly with respect to gas sales, revenues, customers and per customer figures. The exhibit was prepared under my direction and the information which is the basis of the exhibit was obtained from the companies named.

Questions by the Examiner.

You ask if that is from their annual report to the Illinois Commerce Commission.

No, that was not possible—we examined the annual reports to the Illinois Commerce Commission, and in order to have the entire exhibit more along financial lines, where we can get comparable figures we have used the reports of the Illinois Commerce Commission, but unfortunately,
back in 1929, 1930, and 1931, the reports required by
1793 the Illinois Commerce Commission in the way of
breaking down the figures were not in anywhere near the detail that is required today. Generally, the revenues were reported simply by rate schedule. You couldn't find out whether the rate schedule included domestic or commercial or a combination of both. So we have had to obtain figures from the company, set up by the company, and we believe they are comparable, but, of course, the notes at the bottom of each page must be taken into consideration when interpreting the statistics.

I think that the statistics are available to investors. I don't know whether—yes, I can say that those statistics are available to the public, maybe not in exactly this form, not exactly set up this way, but the break-down and things like that are furnished by the companies to such services as Institutional Utility Service which is a financial service available to investors which gives a detailed breakdown of operating statistics and such matters for utility companies. Yes, I have that service. Most of the investors that are engaged in investing in this industry have the service in their files.

You ask what were my immediate sources in connection with this case. I requested information along this line from Mr. Hedrick when I first started working on the case. I think he passed on my request to the companies, I think possibly through Chicago District Pipeline Company. Anyhow, within a short time I was furnished with a portfolio of information along this line which I used in forming my opinion in this case. The material I received was typewritten. I have in my portfolio sheets which I can show you, this Institutional Utility Service, for example, which contains this same information. It is published by Institutional Utility Service.

I don't think I have checked every figure in Exhibit 202 with the data contained in that Service. I have compared certain figures. I have spot-checked it. In other words, I attempted to establish the validity of my figures in Exhibit 202 against this service and against other manuals. I am satisfied the information in here is correct information. As a matter of fact, the statistical department of the Peoples Gas Light and Coke Company puts out a printed sheet similar to this first sheet in this exhibit. I don't know just how wide the circulation of that sheet is. I have a copy of it here, I think. I don't think Moody's and Poor's publish this information in all the detail there is in that sheet; for example, in that one sheet for Peoples Gas Light and Coke Company. I mean a sheet put out by the statistical department of Peoples Gas Light and Coke Company. There are two more sheets right along with it. I would like to keep them together.

I should say that the information with reference to recent years is available in the reports to the Illinois Commerce Commission. You couldn't get the whole ten-year period in a comparable way from the reports to the Illinois Commerce Commission. That is what I feel should be done to indicate the trends.

Redirect Examination by Mr. Hedrick Resumed.

I will now go over Exhibit 202 by pages:

1794 Page 1 of this exhibit shows data on sales, revenue and customers for Peoples Gas Light and Coke Company.

The figures are broken down, both for revenue and gas sales, by customers, during the years 1928 to 1938, inclusive.

The average customers are shown during each year, and certain statistics, such as revenue per therm and average gas sales in therms, are set up on a per customer basis; in addition, annual revenue was set up on a per customer basis.

It will be noted that the 1938 figures are set up on two bases, the Notes A and B explaining the bases.

1938 A shows the figures including $2,667,371 arising from rate increase still in process of litigation, and 1938 B excluding the item of $2,667,371.

In view of what I have been told this morning, that the decision of the Illinois Supreme Court has come down with respect to the increase, I am not sure but what we should exclude the 1938 A figures.

Recross Examination Interposed by Mr. Slaff.

You ask if I think that decision is going to end the litigation right there. I haven't any basis for forming any judgment on that, Mr. Slaff. I just don't know. However, I think we should probably consider it on both bases. It is set up here in that way, and that is the way I intended to portray it.

Taking the revenues from sales to customers during this period, it will be noted that from 1928 to 1938 the total revenues show a slight increase if the rate increase is included and a slight decline over this period if the rate increase is not included.

Looked at from the standpoint of domestic revenue, it will be noted that there has been a decline on either basis, and that excluding the rate increase the decline has been from $23,074,000 in 1928 to $19,404,000 in 1938.

Redirect Examination by Mr. Hedrick Resumed.

That is the second column of figures under the heading of "Revenues From Sales to Consumers". It will be noted that space heating, for which there was a note, has increased substantially during the period 1928 to 1938, that commercial revenues have declined and that industrial and miscellaneous revenues have increased.

Similarly, in the second tabulation on the left-hand side of the page, it will be noted that the total gas sales in therms have in the period 1928 to 1938 more than doubled, that gas sales to domestic customers in therms have declined from some 121,000,000 in 1928 to 113,000,000 in 1938.

The third tabulation on the left-hand side of the page shows the customers, and it will be noted that during
1795 this period 1928 to 1938 total customers have increased, that domestic customers have increased, that space heating customers have increased substantially, that commercial customers have declined, and that industrial customers in number have declined some.

Going to the right-hand side of the page, where the figures shown cover the period 1928 to 1938, on the basis of revenue per therm, generally speaking there have been declines in all classes of sales,—total, domestic, space heating, commercial, industrial, and miscellaneous.

Of course, this period 1928 to 1938 covers the period of the change-over which took place in the latter part of 1931. I refer to the change-over from artificial gas to a mixed natural and artificial gas.

For the Peoples Gas Light and Coke Company the average annual sales per customer in the period have increased substantially, while the average annual sales to domestic customers have declined from 157.6 therms in 1928 to 143.9 therms in 1938.

During this same period there has been a great increase in the average annual sales in therms to industrial customers.

The average annual revenue per customer figures which are shown in the bottom tabulation at the right-hand side of the page for the period 1928 to 1938 show substantial fluctuations during the period.

I think one of the most significant figures or sets of figures in this whole exhibit is the revenue and sales and data concerning domestic customers, because it will be noted that this company derives, at the present time, 60 percent of its revenue from its domestic customers and they are probably properly considered as the backbone of the company's business.

In 1928 the average revenue received per domestic customer was $29.91. That has declined in 1938 to $24.68, excluding the rate increase, or $28.07, including the rate increase. I think the $24.68 figure at this moment is the most significant.

Turning now to the second page, headed "Western United Gas and Electric Company, Northern Division," similar data was prepared on sales, revenue and customers for the Northern Division of the Western United Gas and Electric Company.

The northern division is shown, because that is the division of this company which receives gas indirectly from the pipeline of the Natural Gas Pipeline Company of America. The Company has a southern division which furnishes artificial gas, I believe, to southern Illinois.

The figures here, again, follow somewhat similar trends. The revenue from sales to customers of this company has increased from $3,700,000 in 1928 to $4,200,000 in 1938, but the domestic revenue has declined from $3,290,000 in 1928 to $2,702,000 in 1938.

The number of customers of the company has increased from 82,136 in 1928 to 88,941 in 1938.

1796 The average annual revenue per therm has shown a rather wide variation.

This, again, covers the period of the change-over to mixed gas.

The average annual sales per customer shows a substantial increase largely accounted for by the substantial increase in industrial sales. Insofar as domestic sales per customer are concerned, they show a decline from 159.7 therms in 1928 to 147.2 therms in 1938.

The annual average revenue per customer shows an increase overall from $45.62 in 1928 to $47.32 in 1938 but from the domestic customers the annual average revenue has declined from $40.48 in 1928 to $32.37 in 1938.

Sheet No. 3 is prepared on a similar basis. It should be read along with the notes at the bottom of the page.

This page 3 shows the data on sales, revenue, and customers of the mixed gas territory of Public Service Company of Northern Illinois. It is necessary to separate the statistics, again, of this company, because certain of the territory served by the company is served with mixed gas. Certain other smaller portions of the territory are served with straight natural gas. So in order to have any comparability we have to keep the statistics separate, and I understand the company sets up its figures that way.

The total revenue shows an increase from $6,447,000 in 1928 to $6,735,000 in 1938.

During that period the domestic revenues have declined from $5,249,000 to $3,755,000.

I want to call particular attention to Note 2 on space heating, which shows the basis on which a division is made between these two types of customers.

Space heating in that column there, under revenues, includes the cooking and water heating as well as space heating used by those customers classified as space heating customers.

The company for a space heating customer has only one meter, so all that gas that that customer uses goes through that one meter and it is impossible to say just how much is used for the ordinary purposes of cooking as opposed to the amount used for space heating. That is one of the deficiencies in our statistics, and we have to use them the best way we can.

I think there is no doubt that some domestic is included in this space heating and the note so indicates.

There is a note on the Peoples' sheet under space heating, which says: "These figures include space heating only. Domestic consumption of these customers is included in domestic."

I am not sure but what some estimates have to be made in making that allocation in the case of the Peoples Company, but that is the way the allocation is made by them.

1797 So I think it is necessary in interpreting that decline in the domestic business of the Public Service Company shown on page 3 to take into consideration the fact there is certain domestic business among those space heating customers, but how much we do not know.

The customers of this company have increased substantially during this period. This company's territory is a growing territory.

I am not going to take the time to go over all the per therm and per customer statistics. The trends are apparent. But they should be read in the light of the notes which I have already indicated.

On the fourth page, we have data concerning the natural gas territory of the Public Service Company of Northern Illinois. That shows for that company data on sales, revenue and customers in the natural gas territory of this company, and the same note on the space heating business applies, that the third column there, under space heating, includes cooking and water heating, as well as the space heating for those customers which are classified as space heating customers.

Question by the Examiner.

Yes, prior to 1932, this territory was supplied by artificial gas. I don't know all the details, but they decided to change over there to straight natural, possibly because they did not have production facilities or the production facilities in that territory were old and it was deemed advisable to go to straight natural gas, whereas in the other portions of the territory it was decided to use a mixed gas.

Redirect Examination by Mr. Hedrick Resumed.

The second or middle table on the fourth page is on the basis of therms. You ask whether I have an opinion or judgment as to the effect that these general trends have upon investors in this particular type of utility.

Yes, the trends displayed by the domestic business, which furnishes a large portion of the revenue, and which is the high rate business, are in my opinion not healthy as compared with the electric industry; and in my opinion the prevalence of those trends has made investors skeptical of the future of the business.

You ask whether that would be reflected in any way in the securities of the Natural Gas Pipeline Company of America, in my judgment, if its securities were on the general market. Well, I don't know just exactly how I would translate that particular opinion to the Natural Gas Pipeline Company of America. The Natural Gas Pipeline Company of America is, in the last analysis, dependent on these companies. It is dependent on their sales. Its whole future is dependent on the sales of these utility companies in this area. If the trends are unhealthy, and if gas is not going to hold its own in competition with other fuels, and if the trends are going to decline, continue to decline, and the domestic consumption is going to continue to decline, I think it naturally will be reflected in the investor's valuation of the Pipeline Company which serves this territory. It is bound to be that way.

1798 (At this point counsel for defendants handed to the reporter a document headed "Residential Electric Service in U. S.", with the request that it be marked for identification. At the direction of the Examiner, the document was marked Exhibit 203.

Exhibit 202 was offered in evidence, and the Examiner took his ruling under advisement.)

Exhibit 203 was prepared under my direction. The exhibit shows statistics with reference to residential electric service in the United States. The source of the information was the Edison Electric Institute Statistical Bulletin No. 6 for the year 1938. The Edison Electric Institute, I suppose, would be classified as a trade association of the electric industry, and it has for many years compiled and released statistics on the industry. These figures are generally accepted by investors and other people as the best available information on the subject.

This exhibit shows for a ten-year period the number of customers taking electric service in the United States. It showns an increase from 19,569,606 in 1929 to 22,110,403 in 1938.

During that period the average annual use per customer in kilowatt hours increased from 499 kilowatt hours in 1929 to 845 kilowatt hours in 1938.

The average annual bill during this period increased from $31.44 in 1929 to $35.57 in 1938.

The last two columns on the right-hand side show the per customer information. I think possibly the heading should have "per customer" on there to make it perfectly clear. The figures certainly are on a per customer basis. From the average annual use in kilowatt hours and the average annual bill, it will be possible to compute the average annual rate.

Recross Examination Interposed by Mr. Slaff.

You ask why I did not do that. This exhibit was prepared to show in somewhat similar fashion to the way it was shown in former Exhibits, the consumption per customer in the domestic or residential field, and the amount of money received by the utility company for that use.

If I set up this exhibit on a comparable basis to show the average annual revenue per kilowatt hour, I would have to use six different headings. We have in Exhibit 202 six different sets of statistics with reference to domestic customers. I only used three in Exhibit 203. In order to make it completely comparable, I would have to use six. That could be done. It is all contained in that Statistical Bulletin No 6 of the Edison Electric Institute.

You suggest that the annual revenue per kilowatt hour of domestic consumption in 1929 is approximately 6.4 cents, and in 1938 approximately 4.2 cents. That sounds about right. There has been, I think, in the electric industry throughout the country an increase in consumption per year practically every year; a decline in the average rate in that classification, very nearly in every year since 1929; and the combination of those two has resulted in an increased annual bill per customer in practically every 1799 year during that period. There has been an increased consumption as shown in Exhibit 203. This has been accompanied by a declining rate and an increased bill. I think rate policies have something to do with consumption in the electric field. I think that is obvious. The average American residential customer has available to him today many, many different types of appliances for the use of electric energy; and in this period under consideration there have been many rate reductions, and the customers have continued to use more and more energy and they have paid a bigger bill.

Redirect Examination by Mr. Hedrick Resumed.

This is very largely due to the new type of equipment that the electric industry has furnished to its customers to use; the fact that we have a great development of appliances in the electric field. There are countless ways of using electric energy that appeal to customers. We haven't as many ways to use gas.

Recross Examination Interposed by Mr. Slaff.

Yes, in this respect what is shown on Exhibit 203 lends encouragement to investors in electric securities. That is very definitely so. I think that is one of the things investors look at and get a great deal of encouragement to go into the electric industry. I think that is what they are interested in, an industry which shows not only an increased use, but at the same time a few more dollars per customer.

You ask if a portion of these reductions in rates and increase in use in the electric industry is due to the pressure of regulation and rate reduction ordered by commissions against which companies have from time to time fought. I think certainly there are some of those factors in there. Of course, during this period there have been many voluntary rate reductions, and there have been rate reductions where rate litigation has been the result. I think it is true that even where there has not been rate litigation, the pressure of possible rate reduction by the commissions is also a factor which has brought it down. I think this is reflected in part by these reductions.

Questions by the Examiner.

The calculations made by Mr. Slaff were derived from the second and third column of statistics. They should result the same from the other figures. It is just a matter of dividing $31.44 by 499 to get the average rate in 1929, or dividing $35.57 by 845 to get the average rate in the latest year, 1938.

Redirect Examination by Mr. Hedrick Resumed.

(EXHIBIT 203 was offered in evidence. No objection was made by the Examiner to his ruling taking it under advisement because this exhibit is associated with Exhibit 202. Counsel for defendants handed the reporter a document headed "Commonwealth Edison Company", with the request that it be marked for identification. At the direction of the Examiner, the document was marked Exhibit 204.)

Exhibit 204 was prepared under my supervision and direction. This exhibit shows certain statistics on 1800 customers, consumption, revenue and rates for the Commonwealth Edison Company, the electric company which serves the general territory served by the three Chicago utilities that procure gas from the Natural Gas Pipeline Company of America.

The figures were obtained from Institutional Utility Service; and were the figures furnished by the company to that service agency in my opinion. It will be noted that the only complete comparable figures are from 1930 to 1938, during which time the number of customers have increased. Consumption has increased from 1930, from 537,000,000 to over 721,000,000 in the domestic field.

During that same time the revenues increased from $24,754,000 to $27,948,000.

Consumption in kilowatt hours per domestic customer increased from 468 to 863; revenue from $25.50 to $33.42, and the rate per kilowatt hour declined from 5.45 cents per kilowatt hour to 3.87 cents per kilowatt hour.

In my opinion this indicates a healthy trend, and is one of the reasons why Commonwealth Edison Company is today regarded by investors as one of the outstanding electric utility companies in the United States.

It is one of the reasons why it was able to sell 40 year bonds at approximately a 3.16 basis. It is the only utility company during that great period of refunding which has been able to sell 40-year bonds.

You ask if Commonwealth Edison is a riskier business than the gas industry or the business of defendants. I think the defendants are much riskier propositions from the investor's point of view than is the Commonwealth Edison Company; and I think by and large investors all over feel the same way. In my opinion the electric industry is a less risky industry than that of the natural gas pipeline transmission industry, in general.

Questions by the Examiner.

I am referring to the electric distribution companies. As a matter of fact, Mr. Examiner, in the electric industry most of the companies engaged in that industry have an integrated system. The great preponderance of the industry has integrated operations. There are not many power supply companies left.

In my answer to Mr. Hedrick's question, I was comparing an integrated electric industry against the natural gas pipeline idustry.

(Defendants offered Exhibit 204 in evidence. There was no objection but the Examiner withheld his ruling after the noon hour. On resuming the hearing after the noon hour, the Examiner announced that EXHIBITS 202, 203 and 204 were received in evidence.)

Redirect Examination by Mr. Hedrick Resumed.

1801 Commencing on page 6480 and continuing on through page 6493, I was cross-examined with reference to the relationship between defendants and Chicago District Pipeline Company, and the three Chicago utilities. I was asked if I investigated the assets of the Chicago District Pipeline Company in my investigation. I answered that I had not; that the latter company was unimportant to me. The real strength of the guarantee comes from the companies that are actually selling and distributing gas; namely, the three Chicago area utilities.

You ask what in determining the rate of return to which I testified I considered to be the relationship that existed between the companies mentioned and with reference to the guarantee of the contract of July 25, 1931, by the three Chicago distributing companies. Well, Chicago District Pipeline Company is the company which is wholly owned by the three companies that distribute the gas in this area. I think in my original concept of the problem, I looked through the corporate fiction and felt as though from a financial point of view, at least, of course the fact was as though the gas was purchased direct by the three Chicago utility companies, the Peoples Gas Light and Coke Company, the Public Service Company of Northern Illinois, and the Western United Gas and Electric Company.

From a financial point of view, looking at the contract and the guarantee which exists one could consider the Chicago District Pipeline Company somewhat the same as a buying agent, a separate corporate buying agent for those three companies, namely, the Peoples Gas Light and Coke Company, the Public Service Company of Northern Illinois, and the Western United.

On pages 6532 and 6533, I was cross-examined by Mr. Booth concerning the fact that defendants do not control their markets. In response to questions I testified in substance that defendants have some possibilities of control of the sales of boiler fuel and industrial gas, which is not a large proportion of the revenue, but in respect to the gas sold under firm contracts it has no such control. I added that I did not say that defendants are handicapped today, but that the result of my investigation showed that they might be. I continued that I was not positive that it was handicapped, but I said that it might be handicapped in the future.

You asked what I meant in my testimony in that connection by the terms "no such control" and "handicapped". Well, as I read that line 10 over, particularly in connection with that whole sentence extending from line 7 to line 10, I think that there is an implication in the use of the words "has no such control" that I should explain.

There is almost the implication there that I felt that it had control with reference to boiler fuel and industrial gas. That was not what I wished to convey.

What I really did wish to convey was that as I know the facts, the Peples Gas Light and Coke Company, for example, which markets a great deal of gas, in casting around for new sales of gas, to try to obtain new customers to use gas, might approach a single industry or might make a study of an industry or an individual plant, and try to convince that plant or that segment of industry that gas was a fuel that could be used economically at rates at which it could be sold.

It might then contact or get in touch with the Natural Gas Pipeline Company of America, and across the table with

that company discuss the possibility of selling a
1802 boiler fuel or interruptible gas to that particular
company or to that particular industry, and Natural
Gas Pipeline Company of America, under those circumstances, is in a position to say whether or not it has gas available, and whether or not the gas should be sold at that price. To that extent I might say that the veto power exists in Natural Gas Pipeline Company of America.

That, however, is not the same as having the power of initiation or going out to try to attract a particular type of business. That is wholly in the hands of the Peoples Gas Light and Coke Company, using that just as one of the companies which are the buying companies.

Natural Gas Pipeline Company of America does not have direct contact with the ultimate consumer, and therefore, in my opinion, is not in a position to control the marketing policies of the gas which is sold in this area. That is one of the hazards which I referred to originally in my direct testimony and discussed again on cross-examination, the absence of control of the market or the marketing policy.

I understand that people from the Natural Gas Pipeline Company of America have urged the sale of gas for particular purposes, but that power to urge the sale does not give to Natural Gas Pipeline Company the power to direct the sales or have control over marketing policies to be followed in the selling of gas in this area.

At page 6587 I testified in response to questions by Mr. Slaff that I did not consider it of great importance in coming to my conclusion as to the rate of return that the coal industry had approved generally the tentative recommendations of the experts of the Bituminous Coal Division of the Department of Interior. Then I stated that I would consider it of some importance.

You ask if I had not made a distinction between the use of the words "great importance" and "any importance" in connection with that testimony.

Well, I think there is some considerable difference between the two. I started to say "everything that—". I think if I were going to complete that statement I would say that everything that had any bearing whatever on the Chicago utilities or particularly on the Natural Gas Pipeline Company of America, with reference to this subject of the sale of gas, is of some importance, and probably is entitled to some weight, even though very minute. I felt with respect to the recommendations of the experts of the Bituminous Coal Division of the Department of the Interior that that was not of sufficient importance to me in forming this opinion as to the rate of return in this case to cause me to make any special investigation or study in Washington with reference to what their recommendations were.

I have a correction on page 6597 of the record. Lines 3 and 4, the first sentence, say "I do not think it is based upon the hazards." I am not sure whether I said it that way, but if I did I certainly did not mean it that way. The sentence should read "I do think it is based upon the hazards." I think it would be obvious from reading that line of testimony and the rest of that answer and the other answers there that that is what I did mean.

1803 At pages 7324 and 7325 of the record, the Examiner made the statement with particular reference to pages 3, 4 and 5, of my Exhibit 150, that there was some indication that the witness had selected only the higher yielding issues, and his reason was that the result would not be substantially different, but that the exhibit would be extended. Following that statement I added that in view of the questions which were raised I would like to revise it to include all issues. I have prepared a revision of pages 3, 4 and 5 of Exhibit No. 150 to show additional security issues.

(At this point counsel for defendants handed the reporter a document entitled "All Mortgage Bonds of Domestic Electric and Gas Utility Companies Traded on New York Curb September 15, 1939," with the request that it be marked for identification. At the direction of the Examiner the document was marked Exhibit 205.)

This revision is shown in Exhibit 205. The original pages 3 and 4 of Exhibit 150 showed only one issue of bonds for each company. These sheets in Exhibit 205 show all the bonds of each of the companies listed on pages 3 and 4 of Exhibit 150 which were traded on September 15, 1939.

For example, it will be noted with reference to the Alabama Power Company, the original sheet showed only one issue of 5s of 1968. The revised sheets, Exhibit 205, show four issues traded that day, an issue of 5s of 1946, 5s of 1951, 5s of 1968, and 4½s of 1967.

Similarly for certain other companies which were included in the original pages 3 and 4 of Exhibit 150, additional issues traded on September 15th are shown in the revised sheets. On the original page 4 an average, straight arithmetic average, of 5.12 percent was shown. On the revised basis, and in exactly the same way, the average is 5.15 percent.

(EXHIBIT 205 was offered in evidence.)

Questions by the Examiner.

That is the arithmetic average shown on page 2 of Exhibit 205. My original page 4 of Exhibit 150 showed only one issue of one company, largely for the purpose of showing an issue for each company that I had on that date, but not bothering to show all the issues for each company.

You ask what formula I adopted to choose one issue there and eliminate the othe rthree. I think I selected issues wit hthe highest coupon, which had the longest maturity. That, I think, was my general rule, in preparing this exhibit. I would like to check that with one or two more (examining papers). I think that is right. I selected the highest coupons and the longest maturity.

Recross Examination Interposed by Mr. Slaff.

In the case of Interstate Power Service, the highest coupon was a five of 1956. There I selected the one with the highest coupon. I think generally I should say it this way: I selected first of all the highest coupon, and then, when there were several bonds bearing that same coupon, of those bonds I selected the longest maturity.

1804 *Questions by the Examiner.*

No, I should not have weighted that coupon rate and maturity in order to put my average yield in a corresponding light. I do no consider the averaging of any importance. As a matter of fact, in view of all of the questions that were raised about averages, and weighted averages, weighted by amounts, if I were preparing this exhibit again I would certainly never strike any average. When I first prepared this exhibit I was interested in what it would show; and in my working papers in my office I took a line and divided by the number. We have had a lot of debate in this record as to whether the straight average, straight arithmetic average or the weighted average is the proper one to use. Nobody can decide that with any degree of finality. It is a matter of taste.

When I say the longest maturity, I mean the longest maturity from the present date. I don't mean the longest absolute maturity, but the longest maturity from the present time.

You ask how I came to use the heading on page 3 of Exhibit 150, "All Mortgage Bonds"; that is, whether I started out with the idea of using all mortgage bonds and then determined I would only use selections. Well, I definitely decided that I would confine it to the electric and gas fields. I don't think that I am answering your question directly, I think I probably had in mind when I started this thing to include all issues. Somewhere in the statistical process another man was working on this from the mechanical point of view, and we discussed it, and decided to only show one issue of each company. To that extent the heading is wrong.

As a matter of fact, my original notes which I discussed in connection with this exhibit two or three days before the testimony was given had a note, "only one issue of any company is included, that being the highest coupon and the longest maturity." Somewhere in the process that thing got left off, and caused me all kinds of trouble here on cross-examination. I was accused of bringing in misleading information.

Redirect Examination by Mr. Hedrick, Resumed.

(EXHIBIT 205 was received in evidence without objection. At this point counsel for defendants handed the reporter a document entitled "All Preferred Stocks for Domestic Electric and Gas Operating Utilities Paying Full Dividends Listed N. Y. Curb (September 15, 1939, Prices)," with the request that it be marked for identification. At the direction of the Examiner, the document was marked 206.)

In connection with the Examiner's suggestion, I have prepared a list showing issues in addition to those shown on page 5 of Exhibit 150. This list is set out in Exhibit 206, which was prepared under my direction.

Exhibit 206 could be considered as a revision of page 5 in the original Exhibit 150, to include all issues of preferred stocks of domestic electric and gas operating utilities paying full dividends. The original page 5 of Exhibit 150 showed only one issue of preferred stock of each company; that is, the preferred stock bearing the highest dividend rate.

For example, in the case of Alabama Power Company, the original page 5 of Exhibit 150 shows only one issue, the $7 preferred stock, yielding 7.2 percent. The revised sheets, Exhibit 206, show both the $7 dividend rate preferred stock and the $6 rate preferred stock of that company, selling at 86, or an approximate yield of 7.0.

1805 My original sheet, page 5, did not show the average yield on these preferred stocks, but I have read into the record the fact that I had made the computation, although it was not marked on the exhibit; and that showed that the average yield of those stocks listed there on page 5 of Exhibit 150 was 6.29 percent. I have not in Exhibit 206 showed the average yield of the preferred stocks, although I have made the calculation, and it is approximately 6.21 percent.

Questions by the Examiner.

The original figure on page 5, Exhibit 150, was 6.29. It was not marked on the exhibit, but it was read in the record at that figure.

You state that you have a notation of 6.4. I am not sure about that. I do remember at that hearing I read something in, and then we ran it up on an adding machine. I have marked here on my original copy that I have 6.29. Possibly 6.4 was read into the record, and that was an error. Actually, the original sheet of page 5 of Exhibit 150, if the straight arithmetic average is taken of those yields there listed, would show 6.29 percent.

You ask what theory justifies taking the highest dividend rate in the case of these stocks and the highest coupon rate in the case of the bonds. The procedure would be analogous. This whole exhibit was set up on the basis of showing opportunities to investors.

Now, if you and I were considering buying a preferred stock—let us go down here and take the Jersey Central Power; assuming we were interested in that company. The 6 percent stock shows a yield of 6.5. The 5½ percent preferred stock on the quotation shown here, shows a yield of 6.3. Which would you buy? I think the investor would buy the one today showing the highest yield; although here are markets, actual markets that exist, and people are buying and selling at these prices. Some people apparently are willing to buy the lower yield because the price appreciation factor is in there, since the spread between today's price and the call price is greater; so they are buying; and the best you can say is that they are buying, looking both ways at the same time. They are buying, looking at the yield and looking at the possibilities of price appreciation. An investor who is buying for yield alone, however, it is obvious that he would buy the one with the higher yield if it were selling below the call price.

I purposely selected them in that case, where they were selling well below the call price. No, I don't show the call prices for any of these bonds. In the original record, in the cross-examination, there was read into the record all cases where the securities were selling at or above their call prices, if I remember correctly. That was on page 1 in connection with the Natural Gas Company bonds, and in the cases of pages 3, 4 and 5 of Exhibit 150. Mr. Slaff asked me to indicate whether or not they were selling at or above their call prices. I note that my exhibit here shows the call prices in all cases, because during one of the recesses down there I went through the manual and determined the call prices in order to place myself in position to be able to answer any questions with respect to whether or not they were selling at or above call prices.

Redirect Examination by Mr. Hedrick Resumed.

1806 On pages 7309 and 7346 I testified as to the various companies shown on pages 3 and 4 of Exhibit 150, showing instances where the call prices were lower than the amount the bond was selling for, and in that connection, in response to questioning, I answered with respect to a number of those cases.

(EXHIBIT 206 was offered and received in evidence, without objection.)

Beginning with line 3, on page 7330, I testified in response to a question by the Examiner, in substance, that the New York Stock Exchange requirements are more difficult from the standpoint of information to be furnished than are the requirements of the New York Curb Exchange; and added that it is more expensive for companies to list securities on the New York Stock Exchange than it is with the Curb Exchange. I then added that a great many smaller utility companies never list their securities on the Curb Exchange.

The Examiner asked me if I did not mean the Stock Exchange and I responded Curb Exchange, in connection with my last statement. I think I must have been shell-shocked, because I did not even answer correctly when the Examiner asked me about it. The line 12 should read, "* * * Companies never list securities on the Stock Exchange."

On pages 7376 and 7377, in connection with one of my answers, the record shows I used the expression "They were the ones that we used in the telephone study in exactly the same kind of chart." I think it is a typographical error there. The sentence should read, "They were the ones that were used in the telephone study in exactly the same kind of chart."

On page 6570, line 20 to line 22, in the sentence "Well, a substantial part of their revenue is from sales of an industrial character where the profit margin is probably less per thousand feet than it is for sales under the current contract," the last term "current contract" should read "firm contract."

On pages 7377 and 7378, I testified that in order to get my average earnings price ratio for these twelve companies, we were then considering, I added the twelve earnings price ratios and divided by twelve.

I was asked by Mr. Slaff if I had added the twelve price earnings ratios rather than the twelve earnings price ratios, divided the total by twelve, and taken the reciprocal of the average, would I not have obtained a different percentage. My answer was that the price earnings ratio of any particular company at any particular time is the reciprocal of the earnings price ratio, but that I didn't know about any mathematical acrobatics.

Several other questions were asked in the same connection and at the end of this line of questions I stated to Mr. Slaff that I would talk to him later so that I will clearly know what he had in mind. Mr. Slaff has never talked to me nor I to him about it. I have never made any such calculation because any such calculation is not

any check in any way as to the validity of my statistical method. That question is really, getting down to mathematics, asking the question: "Does the arithmetic mean of the series equal the harmonic mean of the series?"
1807 It never does except in an accidental way. There is not any possible check as to the statistical validity of my method. Taking the reciprocal of my earnings price ratios is a very simple matter. I have the earnings price ratios for twelve stocks, and I put them down and add them up and divide them by twelve; but that will not work out the same, except in an accidental way, with calculations made this other way—the price earnings ratios added together, divided by twelve, and then calculating the reciprocal of that. There is no possible check as to the statistical validity of my process by doing it the other way.

Recross Examination Interposed by Mr. Slaff.

I satisfied myself with respect to the mathematic acrobatics since that time. I think I was probably punch drunk at that time after six days of cross-examination. I should have been able to make a calculation by setting down a simple example that would show that it is only in the accidental case those things would ever check. I don't think Mr. Smith took the same average of price earnings as a check. I am pretty sure he didn't check the validity of his statistical method in that manner because he would not have gotten any check.

Redirect Examination by Mr. Hedrick Resumed.

While Mr. Ostrander was on the witness stand on December 4th certain excerpts from prospectuses of the following gas and utility companies were read into the record during cross-examination at the request of counsel for the Company; on page 9084 the Arkansas-Louisiana Gas Company; 9089, Panhandle Eastern Pipe Line; 9142, Public Service Company of Colorado; 9154, Central Illinois Public Service; 9158, Central Power and Light Company; 9162, Kansas Power Company; 9164, Idaho Power Company; 9166, Missouri Power and Light Company; 9168, Public Service Company of Oklahoma; and 9169, West Texas Utilities Company. I have read the record in that respect and the excerpts that were taken from the prospectuses mentioned.

Yes, I know generally why such provisions are placed in bond indentures of utility companies in recent years. I know generally and I also know specifically with respect to some companies, because I actually sat in while the mortgage was being drafted and insisted those provisions be put in. The reasons are that investors who are buying the bonds of a company which is issuing bonds under an open-end mortgage, and under which the company can put out additional bonds by satisfying the covenants of the mortgage with respect to either property or earnings, are very careful with respect to the kind of property which is made the basis for the issuance of additional bonds. Gas transmission property, compressor stations, distribution systems, power plants and sub-stations are something that are tangible and real. Gas production property, such as leases, leaseholds, owned acreage, or in some places gathering lines, are in the opinion of investors less tangible and real, because a gas field or a gas lease which is worth something today might not be worth anything tomorrow.

From that standpoint the investors, in the mortgages particularly which have been drafted in recent years, from 1935 on, have, generally speaking, required a clause which is generally put in in the place where bondable property is defined, excluding from bondable property production property, and by production property I mean gas leases, leaseholds, acreage owned, and in some places, gathering lines.

1808 In some cases it goes farther than that and does not allow the inclusion within the term "bondable property" of transmission lines except where the transmission lines join together or link together distribution systems.

In the Northern Natural Gas Company case, where I actively took part in drafting the mortgage, we required such a provision.

1809 I sat in as representative of one of the buyers in the actual drafting of all the language of the mortgage.

Schedule 6 of Exhibit 186, introduced through witness Smith, showed as to Northern Natural Gas Company First Mortgage 3¼ per cent A's 1954 offered in August, 1939, in amount $16,000,000, that the yield was 3.25 per cent. At your request, I have made a calculation as to the historical cost of that debt money to Northern Natural Gas Company. I obtained from the SEC photostat of certain portions of the declaration filed by that company in connection with that refunding.

Recross Examination by Mr. Slaff.

It was not a certified copy. I ordered, as I ordinarily do. We have a standing account with the SEC. I order the photostats and they send me a bill. I could rely on its being a true copy of what is contained in the declaration. I could not rely on the declaration wholly because I had to get in touch with the company to get the actual figures because there were certain estimates in the declaration.

Redirect Examination by Mr. Hedrick Resumed.

Then, after obtaining certain information, I made a calculation and attempted to find out what the historical cost of this debt money was. It must be remembered this $16,000,000 issue which came out in 1939 replaced an issue of 4¾ and 4¼ bonds and 4½ per cent debentures on which there were substantial call premiums when they were called and replaced. Said call premiums amounted to a total of $682,955, the duplicate interest was $58,149, the unamortized debt discount and expense on the old issue was $159,646, the other expenses of refinancing amounted to $190,437, or total expenses and premiums and discounts in connection with the refunding of $1,091,187, which spread over a $16,000,000 issue amounts to 6.82 per cent of the principal amount. The average weighted term of the new bonds which had an actual maturity in 1954 is 12.05 years.

Questions by the Examiner.

The weighted average term of the new bonds which have a maturity in 1954 is 12.05 years or say 12 years. That was because of the sinking fund provisions. The yield on a bond which was sold at 93.18, which is 100 less the 6.82 previously mentioned, for a 12-year term is 3.97 per cent. That is obtained from the yield tables. It is just a mechanical job determining it from those tables, and that is what the historical cost of that debt money is in contradistinction to the coupon rate which the present security bears. That is the historical cost net to the company. The historical cost to the company includes all premiums on the old bonds and the discount, the expenses in connection with the issue, the duplicate interest, and things like that. This is a little different from the computation counsel asked Mr. Smith to make from data contained in Moody's. This kind of computation could only be made by finding out just exactly what were the premiums, expenses, and discount which the company suffered, and that is the only way you can get the difference between the yield to investors and the yield to the company.

Redirect Examination by Mr. Hedrick Resumed.

(At this point, counsel for defendants produced a document entitled "Gross Operating Revenue and Net Available for Fixed Charges After Depreciation of the Gas Departments of the Three Utilities Distributing Gas in the Chicago Area, Witness W. C. Gilman," with the request that it be marked for identification. At the direction of the Examiner, the document was marked Exhibit 207 for identification.)

Exhibit 207 was prepared under my direction. This is the financial information which I told the Examiner previously that we had taken from the annual reports by the companies to the Illinois Commerce Commission. It
1810 shows for Peoples Gas Light and Coke Company,
Public Service Company of Northern Illinois, and Western United Gas and Electric Company certain figures as to gross operating revenue and net available for fixed charges for the period 1929 to 1938. The notes should be read in connection with any examination of the figures.

These figures are set up for Peoples Gas Light and Coke Company and Public Service Company of Northern Illinois on the basis of assuming the average gross operating revenue and net available for fixed charges over the period 1929 to 1931, inclusive, as 100 per cent, and showing during the period covered the variations from that.

It will be noted then for Peoples Company starting with 100 per cent as the average for 1929, 1930 and 1931, in gross, that the gross for 1938, excluding the rate increase, is at 98.6 per cent. The net, assuming 1929, 1930 and 1931, as 100 per cent, has declined in 1938, excluding the rate increase, to 40.8 per cent of that amount.

Similarly for Public Service Company of Northern Illinois, the 1938 gross has increased to 116.5 per cent of the average of the gross in 1929, 1930 and 1931. The net, however, has in 1938 declined to 65.5 per cent of the average of 1929, 1930 and 1931.

For Western United Gas and Electric Company, from the Illinois Commerce Commission's reports, it was impossible to obtain comparable figures for the years 1930, 1931, and 1929, as stated in Note 3. Therefore, I used the figures from 1932 to 1938 and assumed the gross operating revenue and net available for fixed charges in 1932 as 100 per cent and show how the gross and the net available for fixed charges have been moved in the period 1932 to 1938. The gross has been increased from 100 to 110.3. The net available for fixed charges has declined from 100 to 71.6.

It should be noted that in the case of Public Service Company of Northern Illinois and Western United Gas and Electric Company, the figures are for the gas departments of those companies. I say that because the companies, in addition to their gas business, also have electric business.

(Defendants offered EXHIBIT 207 in evidence.)

Recross Examination by Mr. Booth.

The source of this data is the annual reports made by the companies to the Illinois Commerce Commission. Those reports were eventually made available to me or to employees of defendants. You ask if I can tell you what the total cost to Peoples Gas Light and Coke Company of producing and purchasing gas for the year 1930 was. I think I could if I had the report for that year before me; but I haven't it before me now, and I do not remember it.

(EXHIBIT 207 was admitted in evidence without objection.)

Counsel for defendants then produced a document entitled "Gas, Electric and Telephone Utility Companies Serving the City of Chicago" and requested that it be marked for identification. At the direction of Examiner, the document was marked Exhibit No. 208.)

1811 *Redirect Examination by Mr. Hedrick Resumed.*

I prepared Exhibit 208 in connection with Schedule 24 of Exhibit 185 for the purpose of showing additional information to that shown on Schedule 24. Schedule 24 in Exhibit

185 shows with respect to the gas, electric and telephone utility companies serving the City of Chicago gross operating revenue for the period 1929 to 1938, and taking the average of 1929, 1930 and 1931 as 100 shows the per cent relation for each of the companies of the gross in each of the succeeding years. Exhibit 208 is set up on a similar basis. It shows the net available for fixed charges after depreciation.

Schedule No. 24 showed that taking the average revenue of 1929, 1930 and 1931, as 100 per cent, that the gross of the People's Gas Light and Coke Company in 1938 was 106.8. That includes the rate increase. This Exhibit 208 shows that the net, taking the average of 1929, 1930 and 1931 as 100 per cent, has declined in 1938 to 51.1 per cent of the 1929, 1930 and 1931 average, excluding the rate increase.

Similarly, the figures are shown as to the movement of the net available for fixed charges of Commonwealth Edison Company and Illinois Bell Telephone Company.

The essential difference between Schedule 24 and Exhibit 208 is that Schedule 24 shows the gross and Exhibit 208 shows the net available for fixed charges.

The source of the data is shown at the bottom of the exhibit and is Moody's Public Utilities Manual, 1934, 1937 and 1939 editions. In that connection, it should be noted that since the source is Moody's Public Utilities Manual, the figures shown in here are as reported by Moody's. In the case of Commonwealth Edison Company, as was originally brought out by Mr. Booth, it shows in 1938 the inclusion for the first time of the consolidation with Super Power Company of Illinois. The company last named is a generating plant down here in Pekin, Illinois, which is a large power supplier for this area. It was originally owned by a number of utility companies in this area. The various interests were purchased by the Commonwealth Edison Company until, as I understand it, they acquired all of the stock and as of December 31, 1938 it was merged with the Commonwealth Edison Company. It was an electric generating company and in addition to that I think it owned some transmission facilities between Chicago and Pekin or Peoria, Illinois.

(EXHIBIT 208 was offered in evidence.)

Recross Examination by Mr. Booth.

I believe that the order reducing the rates of the Illinois Bell Telephone Company was handed down in the year 1938. I am not familiar with the decision handed down by the Supreme Court of the United States. During 1938, as I remember it, there was a rate reduction ordered by the Illinois Commerce Commission and during that year also certain refunds were made to customers. Perhaps I am wrong about that and I will accept your statement on that point. I was under the impression that there were some refunds made in 1938. I do not recall the circumstances that in 1938 the Illinois Commerce Commission entered an order reducing the rates of the Illinois Bell Telephone Company and that that company accepted the reduction.

There was not anything in Schedule 24 of Exhibit 1812 185 under the heading "Illinois Bell Telephone Company" with reference to the matter you have been discussing in these questions. These figures are the figures reported to Moody's Manual. I will accept them as correct. They are the net available for fixed charges. I am pretty confident that Illinois Bell Telephone would not report net available for fixed charges unless it really was net. I attempted to verify whether or not the 1938 figures which showed a sharp decline were in part affected by the reduction ordered by the commission during that year. I noted that reduction myself. It was substantial, some $2,300,000 with the gross remaining about the same. I looked at the break-down of expense in an attempt to locate just exactly what took place; and I found some substantial increases in commercial expense and one or two other items, but I could not put my finger on anything which satisfied me as to why this had taken place, and I did not have time to pursue any further. It is entirely possible that they made some rate increases too in that year.

(EXHIBIT 208 was received in evidence without objection.)

Counsel for defendants then handed the reporter a document entitled "Bonds, Debentures and Notes, Preferred and Common Stocks of Natural Gas Companies, Holdings by Public," with the request that it be marked for identification. At the direction of the Examiner, the document was marked Exhibit 209.)

Redirect Examination by Mr. Hedrick Resumed.

Exhibit 209 was prepared under my supervision and direction. It is set up fundamentally on the same basis as Schedule No. 5-A of Exhibit 186. It shows the same companies and it shows in adidtion some information which I considered pertinent in an appraisal of the information which is implied by Schedule No. 5-A.

Exhibit 209, for example, shows the latest earnings available and the latest times bond interest and fixed charges earned instead of fixed charge coverage only in 1938. We find the yield to the maturities of these bonds as of September 20, 1939 prices. It is proper under those circumstances, to use the latest published earnings. I used the latest published earnings in Exhibit 209, and those earnings were taken from regular published service sources, Ithink, in all cases, either from Moody's Public Utilities Manual or the Public Utility Supplement. In addition to that there is a break-down which can be best illustrated by an example.

For Houston Gulf Gas Company, there is shown on Schedule No. 5-A, Exhibit 186, two issues,—mortgage bonds and debentures. It shows the times fixed charges earned in 1938 for not only the first and collateral sixes of 1943, the debentures of 6½s of 1943, but also a substantial issue of income notes. The total fixed charge coverage in 1938 is reported to be 1.30 in Schedule 5-A.

Exhibit 209 shows that the times mortgage bond interest earned during the latest available earnings period was 3.03 times, shown as the top figure in the "times earned" column. That the times interest earned on the first and collateral sixes of 1943 and the convertible debentures of 1943, lumped together is 2.06. Similarly, there is shown in Exhibit 209 the ratio of mortgage debt to fixed capital, whereas in Schedule No. 5-A of Exhibit 186 there is only shown the relation of total debt to fixed capital as of December 31, 1938.

For example, for the Houston Gulf Gas Company,
1813 Exhibit 209 shows that the ratio of mortgage debt to
fixed capital is 33.38 per cent, whereas Schedule 5-A shows the ratio of funded debt to fixed capital at 43.80. Somewhat similarly for the other companies additional calculations have been shown here which enable one to tell from Exhibit 209 the times mortgage bond interest was earned in distinction to times fixed charges earned and the ratio

of mortgage debt to the total fixed capital instead of the ratio of the total funded debt to the fixed capital.

In addition there have been some sub-totals drawn off and separate figures shown which are finally included in the grand total for companies which are primarily gas distributing companies, such as Southern California Gas Company and Southern Counties Gas Company, which companies are companies with very large distribution facilities, but which happen to have a gas transmission line extending from the distribution areas which they serve into the gas field and through which gas is transported to their properties.

The over-all figures are not greatly different insofar as approximate yield to maturity on the bonds is concerned. There is shown on Exhibit 209 for the companies which we classify as having pipeline operations or as pipeline companies, a yield of 4.06. The yield for the companies which are primarily distribution companies is 3.99. The grand total yield weighted by total amounts outstanding is 4.00 per cent compared to 4.02 per cent as shown in Schedule 5-A of Exhibit 186.

The page entitled, "Preferred stocks of natural gas companies," is basically similar to Schedule No. 5-D of Exhibit 186. I have divided that into a sub-total with the Southern California Gas Company set out by itself. That company, which is primarily a distribution company, has a large amount of preferred stock outstanding, and that preferred stock which sells on a relatively low yield basis, tends to bring down the yield to the 5.35 figure shown in Schedule No. 5-D of Exhibit 186. The preferred stock of Southern California Gas Company alone is nearly 70% of the total preferred stock shown on Schedule 5-D. Eliminating the Southern California Gas Company, we find an approximate yield of 6.08 in Exhibit 209 as against 5.35 in Schedule 5-D of Exhibit 186.

I think there is more information contained here in certain cases than there is in Schedule 5-D, but I think it is self-explanatory and must be read in connection with the notes at the bottom of the schedule.

The page, entitled, "Common Stocks of Natural Gas Companies," is set up on basically the same form as Schedule No. 5-F, Exhibit No. 186. In all cases we have taken the latest earnings available. I believe it improper in calculating an earnings price ratio of any common stock to take anything except the latest published earnings.

After all, an earnings price ratio is the earnings per share of the stock divided by the price of the stock.

If we take the September 30, 1939 quotations as the price for our stock, we certainly should take the latest earnings that were reported to the public prior to that time. Stocks were selling in September, 1939, not so much on the basis of their earnings back in 1938, but what they were earning in 1939, and perhaps what they are going to earn later. Therefore, I think that it is statistically unsound to show or calculate earnings price ratios using prices as of September 30, 1939, and earnings in all cases back in 1938, as shown in Schedule No. 5-F. If the latest reported earnings which were available to anybody 1814 who could read Moody's Manual before September 30th are used, the 7.33 per cent figure would be changed.

Exhibit 209 sets the companies up in two schedules, excluding in the first sub-total Indian Territory Illuminating Oil Company and South Penn Oil Company, which are primarily oil companies, and, as testified to by Mr. Smith, are probably not indicative in any way of natural gas pipeline companies.

Excluding those two companies, and weighting the earnings price ratios at latest earnings, and weighting by market values, instead of using the amounts carried on the balance sheet—it would show an earnings price ratio of 10.45 per cent. I want it clearly understood that this weighting is upon the basis of market value. I think again it is unsound and improper to weight earnings price ratios by the way the amounts are carried on the balance sheet, inasmuch as it is a ratio which is derived from the market price of the stock. If they are to be weighted at all they should be weighted by market values.

(Defendants offered EXHIBIT 209 in evidence.)

Recross Examination by Mr. Slaff.

You ask where I get the pro forma figure with respect to the Oklahoma Natural Gas Company. I think it was taken from Moody's manual. Those bonds were issued in August, 1939, the bonds and the stock. There was a prospectus issued in connection with those securities; and the calculation which is shown on the first sheet here is set up on the basis of the new amounts of bonds outstand ing. There again, I think that Schedule 5-A was improper because it shows the fixed charge coverage, Oklahoma Natural Gas Company, 1.91 times, which was on a capitalization which had completely disappeared. This company refunded all of its debt in 1939. It had new securities outstanding. I think there is no relation whatever between the yield of those new bonds and the times fixed charges earned on a capitalization which has disappeared.

I am not sure that the pro forma earnings with respect to the preferred and common stock of Oklahoma Natural Gas Company also come from the same source. I will have to look at the note. (Examining papers.) This is note 7; for the 12 months ended August 31, 1939; so I would judge that would not be in the prospectus. It must be in Moody's current supplement. You ask where I got the pro forma earnings on the common. Those pro forma earnings are apparently the same as used on the second sheet for the twelve months ended August 31, 1939, and I should judge must have been taken from Moody's current supplement. The prospectus which came out in August would have earnings ending several months prior to the date of the prospectus. That would also apply to the pro forma earnings statement which was used in connection with the bonds referred to on page 1.

(EXHIBIT 209 was received in evidence without objection.)

Redirect Examination by Mr. Hedrick Resumed.

On page 8800 during the cross examination of Mr. Smith, he testified in substance that defendants' bonds would be 3.75 for 40 per cent total capitalization; the preferred stock 20 per cent, yield to the public of 5.75, which he stated was undoubtedly high but a fair figure, and the price earnings ratio of 8 per cent plus a 10 per cent cost of financing on the common stock. You ask if I have an opinion as to the amount in terms of percentage of
1815 common stock that would be required in setting up a securities structure for a natural gas pipeline transmission company, and a further opinion as to the percentage of price earnings ratio on such stock. Yes, I originally testified that I felt that the most appropriate capital structure for a company of this type was from 40 to 50 per cent in bonds and the balance in common stock. I testified that I did not think that preferred stock was

appropriate for a company of this kind. I believe that if it were financed through bonds, 40 to 50 per cent of the amount necessary, that it could raise that money on approximately a four per cent basis, the cost of money to the company; and the balance I believe should be common stock; and I believe that could be raised on the basis of cost of money to the company at not less than 12 per cent. That is about eight times earnings.

If 50 per cent is bonds at 4 per cent, and 50 per cent is in common stock at 12 per cent, that will result in an overall cost of money of 8 per cent. That I believe is proper, and is one of the factors that I took into consideration in arriving at my rate of return. As a matter of fact, I had a number of calculations during cross-examination in Washington, the working papers of which were turned over to counsel, which assumed different yields on bonds and different earning rates on stocks.

Obviously, I have an opinion as to whether or not the securities of a natural gas pipeline transmission company, such as defendants, could be sold on the basis as testified to by Mr. Smith on page 8800. If I thought they could be sold on the basis as he has set them up, I certainly wouldn't have testified that I consider 8 per cent a proper rate of return.

Recross Examination by Mr. Booth.

In both Exhibits 202 and 207 the first money column in each of them relates to the gross operating revenues of the Peoples Gas Light and Coke Company. In the second money column of Exhibit 207 is shown the net available for fixed charges for Peoples Gas Light & Coke Company for each of the years 1929 to 1938, inclusive. This second figure represents, of course, the net available for fixed charges after payment of all operating expenses and after depreciation. It is after production, maintenance, commercial, new business, and all other expenses in the cost of producing gas or the cost of purchasing gas. These figures were taken from the annual reports made by the company to the Illinois Commerce Commission. It is true that the principal item of expense of Peoples Gas Light & Coke Company would be either the cost of producing manufactured gas prior to the time of the introduction of natural gas and the cost of purchasing natural gas after its introduction, plus the cost of producing such artificial gas as the company also produced.

You call my attention to the document you describe as the annual report of the Peoples Gas Light and Coke Company for the year ended December 31, 1930. That is the document from which the figures shown in Exhibit 207 for the year 1930 were obtained. Page G-5 of that exhibit contains the caption "Operating Expenses" and a sub-caption "Production Expenses." The production expenses include coal gas, water gas, and purchased gas. The total amount shown for 1930 for each item was: coal gas $1,977,567.54, water gas $3,004,244.27, purchased gas $5,494,168.16, a total of $10,475,979.97. I think 1930 was the last year in which the Peoples Gas Light & Coke Company supplied manufactured gas. In October, 1931 it began the supply of mixed manufactured and natural gas. The natural gas of course is purchased from defendants through the Chicago District Pipeline Company.

1816 You call my attention to another document described as the annual report of the Peoples Gas Light & Coke Company for the year ended December 31, 1938, to the Illinois Commerce Commission. That also is a document from which information used in compiling the figures in Exhibit 207 was obtained. On page 619 of that document appears the caption "Gas Operating Expenses" and a sub-caption "Total Production Expenses for the Peoples Gas Light & Coke Company." That includes cost of gas purchased, the total amount shown there for gas purchased in 1938 was $12,465,074.64, the total production expenses, which included that item, as shown in that report are listed in line 20 at $14,297,598.65. This report does not give the relative volume of artificial and natural gas at that particular point. It shows the amount elsewhere.

Mr. Hedrick: I have a matter I want to take up.

At page 5610 of the record Mr. Morgan offered the contracts on file with the Federal Power Commission of all the pipeline companies taking gas from the Panhandle field, namely, Colorado Interstate, Cities Service, Panhandle Eastern, Northern Natural, Lone Star and the Consolidated, and the Examiner advised Mr. Morgan these may be offered later. We at this time offer the schedules and contracts referred to in Paragraph Numbered A of Order 53 of the Federal Power Commission dated July 5, 1938, and the information requested in Paragraph D of that same order so far as the following companies are concerned, Colorado Interstate, Cities Service Gas Company, Panhandle Eastern Pipeline Company, Northern Natural Gas Company, Lone Star Gas Company and the Consolidated Gas Utilities Corporation.

The Trial Examiner: To be incorporated by reference?

Mr. Hedrick: To be incorporated by reference.

The Trial Examiner: Any objection?

Mr. Slaff: I have no way at this time of knowing whether what is offered is material or relevant or competent to this proceeding.

Mr. Booth: I want to object.

Mr. Slaff: I don't have them before me here. They are in the Commission's files. They are asked to be incorporated by reference. Certainly I can't at this time assume they are proper or improper for that matter.

Mr. Booth: I want to object to the introduction of these exhibits, these contracts. We are not trying the rates of these other companies in this case, as I understand it. It seems to me that opens up an entirely new field which places an unfair burden. There is no showing as to any relevancy, that these contracts are material at all to any of the issues in this proceeding, and we want to object very strenuously and before they are admitted we think counsel for the company ought to tell us what is in those contracts so that we can have an opportunity to object to them.

Mr. Slaff: We ought to have a statement now, I should think, at least as to the purpose for which they are being offered so we can examine the documents.

Mr. Hedrick: I will ask Mr. Culton to make that statement.

Mr. Culton: They are offered for any assistance they may give the Commission. The evidence shows that gas is being taken from the same field by each and every of these companies. The comparison is relative. The Examiner and the Commission can give those rates, those schedules such weight as it may seem proper. But there are plenty of authorities holding that they are proper for consideration in a matter of this character.

The Trial Examiner: Do you have a memorandum on that, Mr. Culton?

Mr. Culton: Yes, sir. I can give you plenty of cases tomorrow.

The Trial Examiner: I would like to have a short memorandum if it doesn't require any additional preparation on your part.

Mr. Culton: I can give you the cases tomorrow. They are based on all the rate cases. They are not conclusive, manifestly they could not be conclusive, but just for such weight as they may think that to have. One of the witnesses the other day said specifically it would be interesting to make those comparisons.

The Trial Examiner: Do you have copies of those schedules and contracts yourself?

Mr. Culton: We have portions of them, Mr. Examiner, and that is what I referred to a while ago. We may be able to have an analysis ready before we finish so as to put that analysis of those different contracts in evidence. We do not have copies of all of them. We have copies of some of them. We will be glad to submit them to the Examiner so they can see what they are. What they do is show the rate applicable, that is, the contract rate. Most of them give by such and such a number the volume of gas sold and the price. We do not have the contracts, but we have answers to the questionnaires.

The Trial Examiner: I think the Examiner ought to be a little further advised before he makes a ruling on this point.

Mr. Culton: We will be glad to submit to the Examiner the authorities on which we rely.

The Trial Examiner: And the general nature of the matter.

Mr. Culton: We will be glad to supply some of those that we do have. We have some photostats.

The Trial Examiner: If you have a copy of Order 53 I would like to see that.

Mr. Culton: Yes, sir.

Mr. Hedrick: May I loan it to you instead of giving it to you? It is my file copy. I can probably get more.

Mr. Culton: I will state, Mr. Examiner, the authorities which I shall submit consist of opinions by Justices Roberts and Brandeis, principally, on the value of comparison of rates. It is true you can never find them exactly the same. There are differences in distances in transportation. All those factors can be taken into consideration in determining the weight to be given. I recall a very recent case where they held where the freight rate in question on oil was from Mid-Continent Field to Montana, I believe it was, it was proper to show the rate on oil from the Mid-Continent Field to Idaho and the rate from Idaho to Montana was also proper.

I will be very glad to give you the authorities.

The Examiner has on his calendar an undecided motion by Mr. Hedrick, which appears at page 9736 of the transcript, for the incorporation by reference of schedules and contracts filed pursuant to the requirements of Paragraph A and Paragraph D of Order 53 of the Federal Power Commission, dated July 5, 1938, with respect to six companies, whose names appear on pages 9763 and 9768.

The Examiner was supplied by counsel for the companies with photostatic copies of material, indicating what was embraced under the offer; and also references to certain cases which counsel stated supported on the ground of relevancy the admissibility of the evidence offered.

The Examiner has considered the material and the cases referred to, and is of the opinion that the offer should be denied on the grounds that if the evidence were accepted an extended analysis of the wholesale rates of other gas pipeline companies would be required; which would mean extending the present rate case into a rate case involving as well the other six companies referred to in the offer.

The Examiner is aware of the fact that in the cases that counsel has referred to the Interstate Commerce Commission has used rate comparisons with regard to the fixing of rail rates for certain commodities. For instance, in the case cited in the 288 U. S., the commodity involved was petroleum shipped from the midcontinent fields. In the case cited in the 277 U. S., the commodity involved was rosin, referred to as a naval store. In those cases the court held in general that comparative rates could be used as one test, although not a controlling one, upon the question of reasonableness.

The Examiner feels that a fundamentally different legal problem is involved in this proceeding from that involved in the U. S. Supreme Court cases referred to.

Further, while the offer indicates that a comparison is to be made between the six companies, or any one of them, and the instant companies involved in this proceeding, on the basis of shipments of gas from the Panhandle; the Examiner is unable to determine from the offer that a comparison of the wholesale rates charged by the other six companies at their points of delivery with respect to gas transported from the Panhandle can be adopted as a practical test of the reasonableness of the wholesale rates of the instant companies. In the absence of any such showing of relevancy in fact, that is, of comparability of bases of comparison, the Examiner rules that the offer be and is denied.

Mr. Culton: Will you note our exception to the ruling, Mr. Reporter?

Redirect Examination by Mr. Hedrick Resumed.

I just discovered an error in Exhibit 209 which I would like to correct. I have the recalculation made roughly here and it is in the last line of the last column on page 3 of that exhibit. The 10.14 per cent should read 8.20 per cent. The figure 10.45 further up the column is correct.

(December 13, 1939.)

Recross Examination by Mr. Slaff:

In my testimony yesterday shown at page 9670 of the record speaking of the Commonwealth Edison Company 40-year bonds, I said in substance that it is one of the reasons why it was able to sell 40-year bonds at approximately 3.16 basis. It is the only utility company during that great period of refunding which has been able to sell 40-year bonds. What I meant was that the company was the only utility during that refunding period which had sold 40-year bonds. I think too when I spoke generally like that, I meant in large amounts. There might be some isolated case of a small issue of bonds of some company which might be classed as a utility company or water company or telephone company that had sold a bond with a 40-year maturity; but I was speaking of a company which had been able during that period to sell a substantial amount of bonds with a 40-year maturity.

You ask if I am prepared to say that the other large substantial companies which have done substantial refunding in the past year were not able to sell 40-year bonds. They had not, but I think I could say this: that investors during this period of low coupon money have, to the extent that they are able, been putting pressure on to keep the maturities down. There have been a lot of 20-year maturities and 25-year maturities. Investors do not like to tie up their money for very long periods of time at low interest rates, because another cycle may come along here and in five or ten years we may have high-grade mortgage bonds selling on a four and a half or five per cent basis. I do not know of a single case of a natural gas pipeline bond that has had a maturity longer than 20 years. There have been quite a number of 15-year maturities.

You ask if I have any judgment as to whether other large companies which have done refunding in the last five years or so would have been able to do so on a 40-year basis at substantially the same rates. Yes, I have a judgment. I don't think they could. You ask if they could not have financed on a 40-year basis at the rate at which they actually financed. I don't think so. I think if they had refunded with a typical company on a 3½ per cent basis with 30-year bonds, they would have had to pay more for their money if they had had a 40-year bond. Yes, I think
the Commonwealth Edison, had those bonds we were
1817 discussing been 30-year bonds, would have been able
to secure them cheaper than at a 3.16 coupon rate.

Recross Examination by Mr. Booth.

You ask if I participated in the negotiations for refunding of the securities of all the large public utility corporations in the last few years. No, I have helped some companies in certain ways in connection with refunding programs. I mean my present firm has. No, I did not participate in the negotiations concerning the American Telephone and Telegraph Company and its subsidiary companies for the refunding of securities. I do not know what determined the policy of the management of those corporations and the banks or underwriters with respect to the term for which the bonds of those subsidiaries were issued. What I know about that is what I know about how investors think. The question as to what tie-up there is in the maturity and coupon rate is a matter that not only is decided upon by the management, but investors. What investors will take has a substantial influence on the policy of the management with reference to what they shall issue. I keep as closely as possible in touch with buyers of securities. The representatives of the large life insurance companies who buy utility securities are personal friends of mine and I see them in my business at least once a month, the buyers of all of the large life insurance companies. I have no contact with the management of the American Telephone and Telegraph or its subsidiaries and do not directly know from them anything affecting the policy which they have followed in issuing securities.

Recross Examination by Mr. Slaff.

On page 9687, dealing with weighted averages and simple averages, I concluded by saying "Nobody can decide that with any degree of finality. It is a matter of taste." if it be assumed that there were 100 available issues and 99 of them were selling to yield 5 per cent and one of them was selling to yield 3 per cent, the arithmetical average would be substantially around 5 per cent as you say. If the outstanding amount of those 99 5 per cent issues amounted to only a few hundred million dollars and the 3 per cent issue amounted to a billion dollars or several billion dollars, the weighted average yield would be substantially 3 per cent or close to 3 per cent.

Yes, if there were large institutional investors with many millions of dollars to invest, looking at the securities available for investment, they would have to take into account that although there were many, in number, of 5 per cent issues on the market, the amount in dollars of such issues available to them was limited. In determining the opportunities open for investment, we must consider not only the rates, the yield on individual issue, but also the amount of each issue, it is true; but, of course, when we are talking about these companies, and when we are calculating these earnings price ratios, we were talking about companies which had earnings price ratios varying from four to ten, eleven, or twelve per cent. They were all large companies and each one of them had millions of dollars of securities outstanding in the hands of the public.

Yes, Exhibit 205 shows an average approximate yield of 5.15 per cent. Large institutional investors are buying today large quantities of this type of security yielding them only three to four per cent.

1818 Those institutions are faced with the problem of taking securities that are available in such quantities as are necessary for their purposes. Yes, they are constantly faced with the problem of what the available opportunities for investment are and in considering that problem they must consider not only the yield on the issues involved but the amount of each issue.

You ask me to assume that I bought one share at $100 and another share at $200, both of which stocks were earning 8 dollars per share; the earnings price ratio on the two stocks would be 8 per cent and 4 per cent respectively. The average earnings price ratio would be 6 per cent. The investment in those two stocks is $300. The earnings on those two stocks would be $16. On that basis dividing $16 by $300, the total purchase price, the earnings price ratio would show 5⅓ per cent. You ask if that is the type of harmonic mean that I waived aside for purposes of this case. No, where I introduced the words "harmonic mean" I had reference to your question as to whether or not I could check the statistical validity of my earnings price ratio by finding the average of the price earnings ratios and taking the reciprocal of that. That is where I used the words "harmonic mean."

Yes, in preparing the chart in my Exhibit 150, I used the straight arithmetic average. In determining the earnings price ratio on common stock as shown in my Exhibit 209, I did not make any investigation to determine what provisions were made for depreciation, amortization, and depletion by each of the companies involved. The companies included in that exhibit are just exactly the same as the companies which were included in Mr. Smith's exhibit 186.

You ask if it is not possible that such earnings as are shown represent a return of capital as well as a return on capital. It is possible, Mr. Slaff, that the depreciation charges are too low, in which case the actual earnings reported might represent a return of capital to the extent that it is paid out. And conversely, of course, the depreciation in some cases may be too high, in which the earnings may be understated. I haven't made any investigation of these particular companies.

You ask why in my Exhibit 209 I weighted the earnings price ratios by market value, instead of using the balance sheet method. I believe I followed the same general technique that was followed in the preparation of Exhibit 186. I have included certain additional information, to include in the exhibit certain other information that I thought was pertinent. Mr. Smith had weighted his results on the basis of book value. I felt from a statistical point of view, it was unsound to weight them by book value; so I weighted them by market value. You ask if I felt it was sounder to weight them than to take the simple average. I don't think I had that conscious decision to make. If I had been setting up a number of companies to determine an earnings price ratio to guide me in forming an opinion as to a return which would be demanded by common stock investors, I think I might have weighted the earnings price ratio. You ask if I would not have gotten 9½ per cent instead of 10.45 if I had weighted them in this particular case. I haven't made the calculation.

Recross Examination by Mr. Booth.

I recall stating in the record in this case that it was
1819 my theory that the risk to the company was greater
because its taxes were lower. I made this statement with an explanation. The simple words, the lower the taxes, the higher the risk, without having taken into consideration the additional statements that I made are misleading, I think. When I stated at page 9638 "We were always afraid to buy the securities of Pennsylvania companies" I was referring to my tenure with the Equitable Company. Yes, I did say that the Pennsylvania Electric Company is one of the principal utilities operating in Pennsylvania, and renders electric service to the City of Philadelphia and surrounding territory. I have not a copy of the list of the securities owned and held by the Equitable Life Assurance Company. I have not a schedule of the securities owned by the Equitable Life Assurance Company as of December 31, 1938.

You have handed me a copy of such schedule. The Philadelphia Electric Company is listed among the companies whose securities are held by the Equitable Company. The total amount of its bonds owned by the Equitable is $11,716,000 of first and refunding 3½'s due 1967. The Duquesne Light Company in Pennsylvania is a large operating company in that state. Equitable owns $685,000 of first 3½'s due 1965 of that company. Equitable owns $4,810,000 first 4½'s, due 1968 and $1,000,000 first 4's due 1965 of Metropolitan Edison Company, a part of the Associated Gas & Electric System. No, I don't think the Associated Gas & Electric System has as high a standing in the minds of the investors as the Consolidated Edison group, the Niagara Hudson group or the North American Holding Company system.

The Metropolitan operates in Pennsylvania. Its headquarters are at Reading, Pennsylvania. That is the principal town it serves. It serves surrounding territory in central Pennsylvania.

Recross Examination by Mr. Slaff.

There are other large institutional investors which buy securities of Pennsylvania operating companies. I think I should mention here that the period I was speaking of was during my experience with the Equitable. When we were in some doubt as to the securities of the Pennsylvania utility companies, when their taxes were low and when we would want a higher return, was a number of years ago. Since then anybody who takes the trouble to check it can see that the taxes of these Pennsylvania companies have gone up.

Questions by the Examiner.

On page 9638, line 14, where I said "In the state of Pennsylvania at that time public utility companies did not pay taxes based on the property in the communities which they served," by "that time" I meant when I was with the Equitable which was prior to 1935.

Recross Examination by Mr. Booth.

No, I do not know what the taxes of Philadelphia Electric Company were for 1938 other than income taxes as related to its gross revenue. I cannot state the figures. I cannot state the percentage figures as to any of the utilities operating in the State of Pennsylvania. In my file here there is a tabulation that is released by the Securities and Exchange Commission which I examine from time to time which shows the taxes of some 177 operating utility companies. I have referred to it many times in the course of preparing for this testimony and particularly for the cross-examination by you in Washington. This may be the first time I have mentioned it in the record, but it is not the first time I have looked at it.

1820 *Questions by the Examiner.*

That study came out in the spring of 1939. It covers a series of financial statistics on utility companies which are subsidiaries of registered holding companies for the year 1938.

Recross Examination by Mr. Slaff.

I can't state now the differential in return that I would demand on any Pennsylvania utility securities compared with another utility's securities.

Redirect Examination by Mr. Hedrick Resumed.

In connection with my cross-examination yesterday, on page 9732 Mr. Booth asked me to read into the record some figures from reports of the Peoples Gas Light and Coke Company covering 1930 and 1938 concerning the price paid by that company for gas in those years. From the annual reports of the Peoples Gas Light and Coke Company to the Illinois Commerce Commission for the years 1930 and 1938, I have drawn off the following figures.

In 1930, the total cost of gas produced and purchased was $10,475,979.97. The total amount of gas produced and purchased was 44,828,905 MCF, which, converted to therms on the basis of 535 Btu gas, would give a total of 239,834,642 therms; or an average cost of gas per therm of 4.37 cents.

In 1938 the total cost of gas purchased and produced was $14,297,598.65. The amount of gas produced and purchased was 522,210,715 therms, or an average cost per therm of 2.74 cents.

Question by the Examiner.

I have had a statistician check that 8.20 per cent correction on Exhibit 209 concerning which I testified at page 9742 and he tells me that the figure is correct. I previously stated at page 9690 of the transcript that the 6.29 per cent is correct and that it should not be 6.40 as it appears previously in the record.

1821 (At this point the Trial Examiner made the following statement into the record:

In regard to the two exhibits 189 and 190, which are the indentures between Natural Gas Pipeline Company of America and the Chase National Bank of the City of New York, trustee, in the first case, and the Texoma Natural Gas Company and the Chase National Bank of the City of New York, trustee, it seems to the Examiner that the following material can be stricken under the ruling admitting these exhibits with a proviso that certain property description would be omitted.

Omitting all after "Main Line" on page 13, in regard to Exhibit No. 189, to the bottom of page 18; pages 19 to the bottom of page 82, everything beginning after the title on page 19, "Beaver County, Oklahoma," retaining all the county names on pages 19 to 82.

Again omitting all particular descriptions of pieces and parcels of lands on pages 82 to 85, on the latter page down to the title, "Miscellaneous Lands In Fee."

Again omitting all particular descriptions of pieces and parcels of land after, "County of Cloud, State of Kansas", which is on page 85 to the third line at the top of page 91, again retaining all county names.

And finally omitting the general description of the Telephone System after the colon on page 91 down to line 28 on page 93.

In regard to Exhibit No. 190, omitting description of land after "Carson County, Texas," page 10 down to the line beginning "Except" on page 31, but retaining all names of counties and state.

Omitting the general description of pipeline beginning after the second colon in paragraph marked: "Second," page 31, down to the paragraph marked "Third" page 32.

Again omitting the description after the second colon of the paragraph marked "Third," page 32 to line 5, page 33.

Again omitting descriptions of real estate beginning after "Gray County, Texas," page 33 to paragraph marked "Fifth," page 43, retaining names of counties and state.

And finally omitting each whole paragraph following the second colon of each of the paragraphs marked "Fifth," "Sixth, Seventh, and Eighth," and with respect to paragraph marked "Ninth," page 45 of the five paragraphs after the second colon down to the paragraph marked "Tenth" on page 46.

The Examiner will instruct the reporter to make extra copies of these omissions in such form that those for Exhibit No. 189 may be attached by separate sheet to Exhibit No. 189 and those for Exhibit 190 may be attached by extra sheet to Exhibit No. 190. With those omissions, the admission of Exhibits 189 and 190 is complete, subject, however, to any corrections counsel may bring to the attention of the Examiner.

(At this point, counsel for defendants offered in evidence certain extracts from the minutes of the hearing before the Committee on Interstate and Foreign Commerce House of Representatives, Seventy-Fifth Congress, on H. R. 4008, March 24 and 25, 1937, being the hearing with
respect to what is now known as the Natural Gas Act.
1822 The offer covered specifically Section 4(a) and Sec-
5(a) as shown on pages 2 and 3 for the purpose of showing that the wording of those sections at that time was the same as has been carried forward into the Act as finally adopted.

Defendants then offered the language on page 45 of the same report, commencing as follows: "Mr. Booth. Let me suggest this other amendment," and ending with the quotation on that page, which is the amendment which Mr. Booth offered.

Counsel for defendants then offered some testimony of Mr. Maltbie beginning on page 114 with the words, "Now, there is no provision in here regarding temporary rates," and concluding on page 115 with the statement by Mr. Maltbie "Unquestionably it does. The opinion of the Court of Appeals pointed that out."

The Examiner instructed the reporter to copy the marked sections from the document referred to on the pages referred to, that is pages 2, 3, 45, 114, and 115, at this point in the record as if read. Pursuant to such instructions, the reporter incorporated the extracts from the report referred to as follows:

"Sec. 4(a) All rates and charges made, demanded, or received by any natural-gas company for or in connection with the transportation or sale of natural gas, subject to the jurisdiction of the Commission, and all rules and regulations affecting or pertaining to such rate or charges, shall be just and reasonable, and any such rate or charge that is not just and reasonable is hereby declared to be unlawful.

"Sec. 5(a) Whenever the Commission, after a hearing had upon its own motion or upon complaint of any state, municipality, or State Commission, shall find that any rate, charge, or classification demanded, observed, charged, or collected by any natural-gas company in connection with any transportation or sale of natural gas, subject to the jurisdiction of the Commission, or that any rule, regulation, practice, or contract affecting such rate, charge, or classification is unjust, unreasonable, unduly discriminatory, or preferential, the Commission shall determine the just and reasonable rate, charge, classification, rule, regulation, practice, or contract to be thereafter observed and in force, and shall fix the same by order.

(Extract of page 45 is as follows:)

"Mr. Booth: Let me suggest this other amendment and then I am through.

"The Chairman: Very well.

"Mr. Booth: First I want to offer for the record a provision which would have the effect of authorizing the Federal Power Commission, under any temporary rate situation to fix temporary rates.

"Mr. Bulwinkle: Fix temporary wholesale rates?

"Mr. Booth: Yes. The proposed temporary-rate provision would read as follows:

"The Commission may, in any proceeding involving the rates of any natural-gas company brought either on its own motion or upon complaint, upon notice and after 1823 hearing, if it be of opinion that the public interest so requires, immediately fix, determine, and prescribe temporary rates to be charged by said company pending the final determination of said rate proceeding. Said temporary rates so fixed, determined, and prescribed shall be sufficient to provide a return of not less than five per cent upon the original cost, less accrued depreciation, of the physical property of said company used and useful in the gas service, plus a reasonable amount for working capital, and if the duly verified reports of said company to the commission do not show the original cost, less accrued depreciation, of said property, the Commission may estimate said cost less depreciation and fix, determine, and prescribe rates as hereinbefore provided. In any such proceeding, whenever the annual depreciation expense is computed upon the sinking fund method, no depreciation shall be deducted from such original cost.

"Temporary rates so fixed, determined, and prescribed under this section shall be effective until the rates to be charged, received, and collected by said company shall finally have been fixed, determined, and prescribed. The Commission is hereby authorized in any proceeding in which temporary rates are fixed, determined, and prescribed under this section, to consider the effect of such rates in fixing, determining, and prescribing rates to be thereafter charged and collected by said company on final determination of the rate proceeding.

(Extracts on pages 114 and 115 are as follows:)

"Now, there is no provision in here regarding temporary rates. I think Mr. Booth, of the Illinois commission, made a suggestion yesterday suggesting that a section copied after the law in the State of New York regarding temporary rates should be added here, and we have found it very advantageous. We have found that section in the State of New York to be advantageous and it has been upheld by the court of appeals, so that it is the law in the State of New York at the present time.
